The project area being in the region south-east of the western ghats, the area is hot and dry for eight months of the year. Cold winds are experienced during February and March. The hottest months are from March to July. The project stretches experiences a moderate climate from August to October, tempered by heavy rain and thundershowers, and a slightly cooler climate from November to February. Fog and dew are rare, occurring only during the winter season. Being equidistant from mountains and the sea, it experiences similar monsoon pattern with North-east monsoon and South-west monsoon, with the former providing more rain during October to December. Temperatures during summer generally reach a maximum of 42°C and a minimum of 26.3°C, although temperatures up to 43°C are not uncommon. Winter temperatures range between 29.6°C and 18°C. The average rainfall for the project is about 857.60 mm per year, occurring almost entirely within the three months of the South-west Monsoon.

2.4 Terrain

The Project Road traverses through plain terrain.

2.5 Abutting Land Use

The land use along the Project Road is predominantly agriculture or barren with intermittent built-up area.

2.6 Right of Way

The width of the existing Right of Way (ROW) for the Project Road is 60 m throughout its length.

2.7 Existing Utilities

During widening of the Project Road, various affected utility services were shifted to proposed ROW. The different types of utilities found along the road include, electrical poles, telephone poles, OFC cables, etc.

2.8 Development as per Schedule-B

The Project Road from Madurai (km. 0+000) to Virudhunagar (km. 52+300) has been developed as a four-lane divided carriageway with median width of 2 m, service road at some built up locations and other arrangements. The Project Road passes through rural as well as built-up sections.

Following is the Scope of Work as per Schedule-B of Concession Agreement.

Table 2-1 Details of Scope of Work

Sr. No.	Type of Structure	Unit	Scope	Remark
1	O&M of Main Carriageway	km.	52.30	
2	Construction of Service Road	km.	1.050	
3	Widening of Pipe Culvert	Nos.	01	
4	Repair & rehabilitation of Major Bridges	Nos.	03	
5	Repair & rehabilitation of Minor Bridges	Nos.	12	
6	Repair & rehabilitation of Box Culvert	Nos.	19	
7	Repair & rehabilitation of Pipe Culvert	Nos.	59	
8	Repair & rehabilitation of ROB	Nos.	02	
9	Repair & rehabilitation Vehicular Underpass (VUP)	Nos.	09	
10	Improvement of Junctions	Nos.	09	
11	Provision of Drain	km.	1.050	

3 CONDITION ASSESSMENT OF PROJECT ROAD

3.1 Pavement

The Project Road is four lane divided carriageway and generally has paved carriageway of 9.0 m with earthen shoulder of 1.5 m on either side. The Project Road has a median width of 2.0 m throughout its length.

The entire stretch of Project Road including service road is constructed with flexible pavement. The pavement type for the Toll Plaza including taper is of rigid pavement.

3.1.1 Pavement Condition Survey

Pavement condition survey was carried on **13th March 2026 and 14th March 2026** through visual inspection for the entire project length. From the visual inspection, it is found that the average pavement condition of the Project Road is found to be Good.

Some of the photographs taken during the site visit are presented as below.

Figure 3-1 Photographs of Pavement Condition (MCW)

km. 2+994

km. 4+005

km. 14+780

km. 39+600

km. 51+100

km. 52+500

3.2 Service Road / Slip Road

The width of the service road varies from 5.5 m to 7.0 m. The service road is constructed in a built-up area and adjoining underpass locations. The Project Road has total service road length of 40.730 kms.

The photographs taken during the site visit are presented below.

Figure 3-2 Photographs of Service Road

Service Road / Slip Road at km. 14+700 (LHS)

Service Road / Slip Road at km. 20+370 (LHS)

3.3 Junctions / Intersections

There are a total of 09 nos. of junctions / intersections along Project Road.

The photographs taken during site visit is presented as below:

Figure 3-3 Photographs of Junctions

Junction at km. 2+150

Junction at km. 3+400

3.4 Condition Survey of Bridge

The inventory of structures including major bridges, minor bridges, ROB's, underpasses and culverts is presented in table as below:

Table 3-1 Details of Summary for Structures

Type of Structure	Total Number of Structures
Road Over Bridge (ROB)	2
Major Bridges (MJB)	3
Minor Bridges (MNB)	12
Vehicular Underpass (VUP)	09
Culverts	78
Total	**104**

The detailed condition survey of structures was carried out by visual inspection. The observations and findings are presented in table below:

Table 3-2 Condition Survey of Major Structure

Sr. No.	Chainage (km)	Side	Span Arrangement (m)	Carriageway (m)	Deck Width (m)	Type of structure	Type of foundation	Remarks
Major Bridges								
1	2+994	LHS	17x23.8	7.5	10	RCC	Open	The structure is sound in condition. However, expansion joints need to clean.
		RHS	17x23.8	7.5	10	RCC	Open	The structure is sound in condition. However, expansion joints need to clean.
2	33+150	LHS	7x8.8	7.5	10.25	RCC	Open	The structure is sound in condition. However, expansion joints need to be cleaned, and vegetation need to be removed.

3.5 Condition Survey of Culverts

The cross-drainage structure includes Hume pipe culverts and box culverts at various locations. There is total 78 Nos. of culverts along the Project Road. The height of the culvert varies from 1.0 m to 3.0 m from bed level. During the condition survey of structure, these culverts were inspected on sample basis.

The project involved strengthening and widening of existing road to four lane divided carriageway. The culverts beneath existing alignment are either widened or reconstructed. The structural condition of culverts is generally found in sound condition. The quality of surface concrete of box culverts is satisfactory. The RCC parapet, metal beam crash barrier or RCC railing has been provided at culvert locations wherever required which is maintained properly.

In most of culverts, the waterway is clear. However, near to urban area, it is found blocked due to debris, drainage water or bushes, tree growth, which has to be removed and cleaned before monsoon to clear waterway. The stone pitching has been provided for slope protection.

The photographs taken during the site visit are presented below.

Figure 3-5 Photographs of Hume Pipe Culvert and Box Culvert

Box culvert at km. 27+210

Box culvert at km. 31+070

Hume pipe culvert at km. 12+717

Hume pipe culvert at km. 23+502

3.6 Drainage

There is 5.506 kms of existing drain (which includes drain on both sides) along the Project Road as per Concession Agreement. However, 0.950 kms of RCC drain is additionally constructed in locations where service roads are provided.

3.7 Slope Protection

Slope protection and chute drains are found on Project Road at required locations.

3.8 Road Furniture

The Concessionaire has provided additional road furniture along the Project Road as per the standards and specifications mentioned in Schedule-C. Details of the items are provided below.

3.8.1 Pavement Marking

Pavement marking for the Project Road is done as per the design standards indicated in section 12 of Schedule-D. The pavement marking is found to be Good throughout the Project Road.

Some of the photographs of road marking are presented below.

Figure 3-6 Photographs of Pavement Marking

Pedestrian Marking at km. 2+000 (LHS)

Road marking at km. 20+680 (LHS)

3.8.2 Road Studs

Road studs/ cat's eye for the Project Road is done as per the design standards indicated in section 12 of Schedule-D. Road studs / cat's eye has been fixed at junction and zebra crossings.

3.8.3 Traffic Signage / Median Kerb painting / KM Stone

Traffic signs includes roadside signs, overhead signs, kerb mounted signs and median signs along the Project Road. The design for the traffic signs along the Project Road is done as per the design standards indicated in Schedule-D.

The height, lateral clearance, location, and installation are as per relevant clauses of Schedule 'D'. Overhead sign has been installed ahead of major intersections, toll plazas, start / end of Project Road and urban areas as per detailed design requirements. Roadside signs, overhead signs, kerb mounted signs, vertical post of sign boards, chevron boards and median kerb paint are all in good condition. Some of the photographs of sign boards are presented below.

Figure 3-7 Photographs of Sign Boards

Hazard Marker & Median Sign Board

Place Name / Direction Sign Board

Kilometre Stone

Information Sign Board for median opening

Information sign board related to diversion

Speed limit indicator sign board

3.8.4 Highway Lighting

Highway lighting is provided at underpasses, flyovers, toll plaza, ROBs and built-up locations. High mast lighting is provided at toll plaza location. Highway lighting is also provided at approaches of underpass and flyovers.

Some of the photographs of highway lighting are presented below.

Figure 3-8 Photographs of Highway Lighting

Highway Lighting at Toll Plaza

Highway Lighting at km. 33+400

3.8.5 Crash Barriers

Metal beam crash barriers are provided at bridge approaches, locations of high embankment and sharp curves. All the crash barriers provided by the Concessionaire are maintained at site.

Some of the photographs of metal beam crash barriers are presented below:

Figure 3-9 Photographs of MBCB / Crash Barrier

Metal beam crash barrier at km. 8+900

Metal beam crash barrier at km. 12+700 (LHS)

3.8.6 Delineators

The traffic delineators are provided by the Concessionaire for road users in abnormal condition of weather for the Project Road. The same is maintained by the Concessionaire. Some of the photographs of delineators are presented below.

Figure 3-10 Photographs of Delineator

Road Delineator at km. 10+000

Road Delineator at km. 14+780

3.8.7 Pedestrian Guard Rail

The pedestrian guard rails are provided in the median. It is maintained by the Concessionaire. Some of the photographs of pedestrian guard rails are presented below.

Figure 3-11 Photographs of Pedestrian Guard Rail

At km. 18+010 - Between MCW and SR

At km. 49+350 - Between MCW and SR

3.8.8 Road Land Boundary

Road land boundary pillars have been found on Project Road.

3.9 Avenue Plantation and Median Plantation

Avenue plantation is provided in open country locations and median plantation has been provided in the project length as per IRC specification. Some of the photographs of avenue plantation and median plantation are presented below.

Figure 3-12 Photographs of Avenue Plantation & Median Plantation

Avenue Plantation

Median Plantation

3.10 Toll Plaza

As per the Concession Agreement, there is one existing toll plaza at Kappalur Village at km. 18+935 with the following infrastructure.

Table 3-3 Details of Summary for Toll Plaza Items

Sr. No.	Particulars	Details
1	Toll Plaza Chainage	km. 18+935
2	Number of Tolling Lanes	8 lanes for toll operation plus 2 lanes for over-dimensional vehicles.
3	Weigh in Motion Facility (Number of Lanes)	Yes
4	No. of ETC Lanes	in each direction
5	Number of Toll Booths	9 singles
6	Canopy	Present
7	Administrative Building	Present
8	Parking cum Toilet Block	Present
9	Availability of Tunnel or Elevated Walkway for Movement between Toll Lanes and Administrative Building	Tunnel/no
10	Availability of Static Weigh Bridge	Yes
11	Availability of Loading/Unloading Facility for Overloaded Vehicles	No
12	Storage facility for Overloaded Material	No
13	High mast Light	Yes
14	Streetlight	Yes (only 20 nos. near Toll Plaza. 10 nos. in both direction)
15	Low mast Light	No
16	User Fee Boards	4
17	Cantilever/Gantry Boards	Yes

Sr. No.	Particulars	Details
18	Automatic boom barrier	Yes

Figure 3-13 Photographs of Toll Plaza

Toll Plaza at km. 18+935

Toll Plaza at km. 18+935

3.11 Lane Equipment

Following are the lane hardware and equipment installed at toll plaza.

1. RFID ETC Transceiver
2. Lane Controller with Industrial PC
3. AVC Sensors
4. Automatic Lane Barrier (ALB)
5. Lane Traffic Light and user fare display
6. Incident Capture Camera
7. Overhead Lane Signals
8. Traffic Lights
9. Toll Booth Equipment

3.11.1 RFID ETC Transceiver

RFID ETC Transceiver reads tags installed on the windshield of vehicles and mounted on a pole at about 6 m height. Handheld RFID readers are provided (1 no. in each direction) in case a tag is not detected by the fixed reader.

RFID

3.11.2 Lane Controller with Industrial PC

Toll Lane Controller is located within the Electronic Enclosure placed inside each toll booth which are connected to the common server and are capable of independent storage of data.

3.11.3 Automatic Vehicle Classification (AVC) Sensors

The AVC equipment comprises of camera based, axle sensors and inductive loops. The height detector has a high sensing resolution and detects height when object blocks the path. The presence of vehicle is detected by inductive loop. The loop sensors embedded on the pavement trigger the AVC height sensors located on parallel pillars.

AVCC at Toll Plaza

3.11.4 Automatic Lane Barrier

Boom barriers installed on all lanes are in working condition and have a working time of 0.6 - 0.9 s. Automatic Lane Barrier is used to allow only authorized vehicles to pass through the lane. The barrier is activated only on generation of user fee receipt or other relevant vehicle processing activity. A torque motor powers the barrier for raising and lowering the boom. The motor can be blocked at any position without causing any damage. In the event of power failure, the boom is automatically raised. The boom weight is exactly balanced by built-in springs.

ALB at Toll Plaza

3.11.5 Lane Traffic Light (LTL) and User Fare Display (UFD)

Lane Traffic Light (LTL) is used to instruct vehicles to stop or pass through the lane. The LTL is RED when the toll collector is expecting the vehicle at the booth. After the transaction is done; the LTL turns Green to instruct the vehicle to pass through the lane. The User Fare Display is a part of electronic toll collection equipment located at the toll booth. It is a mini variable message sign (VMS) made of Light Emitting Diodes (LED). The user fare display is used to display the toll fare that is due and that must be paid by the motorist and the classification of vehicle selected by the collector.

LTL at Toll Plaza

3.11.6 Incident Capture Camera (AVC Camera)

The incident capture camera is installed on the island of the booth to capture the image of the vehicle from the back side. The AVC triggers the Image capture system.

3.11.7 License Plate Image Capture Camera (LPIC)

License Plate Image capture camera is installed on a 3 m pole facing incoming vehicle to capture the image of the vehicle number plate.

LPIC at Toll Plaza

3.11.8 Over Head Lane Signal (OHLS)

The **Overhead Lane Signal (OHLS)** for lane “Open” and “Close” sign consists of a pair of “GREEN” (arrow) and “RED” (cross) lights. The OHLS is located at the vehicle approaching side of the canopy to show the drivers whether the lane is open or closed.

OHLS at Toll Plaza

3.11.9 Toll Booth Equipment

Toll Booth Hardware / Equipment provided are:

- Toll Collector Display (Operator Monitor)
- Customized Industrial Keyboard
- Receipt Printer
- Intercom Slave unit
- Bar code reader
- Violation Light and alarm
- Manual Booth Control (MBC)
- Booth Camera

The operator monitor termed as Toll Collector Display (TCD) is located on the toll collector's desk. It is the system's interface to the toll collector, to display the status of transactions and status of the lane peripherals.

The keyboard on the toll terminal is a programmable keyboard for Registration of toll operations and is customized for different vehicle types and type of ticket.

Thermal printers are installed at the toll booths to print tickets. Intercom slave unit facilitates communication with the master unit located in the control room.

Violation system has an alarm switch which is triggered whenever there is a violation such as run-through happening on the lane. When there is an emergency, a foot switch pressed by the booth operator alerts the control room.

Booth Cameras are provided on the inside roof corner of the booth to provide surveillance through CCTV screen located in the control room. Manual Booth Controller is used to release exempt vehicles.

3.11.10 Medium Speed Weigh in Motion (MSWIM)

Medium Speed Weigh in Motion (MSWIM) is installed on entry lanes of Toll Plaza.

MSWIM at Toll Plaza

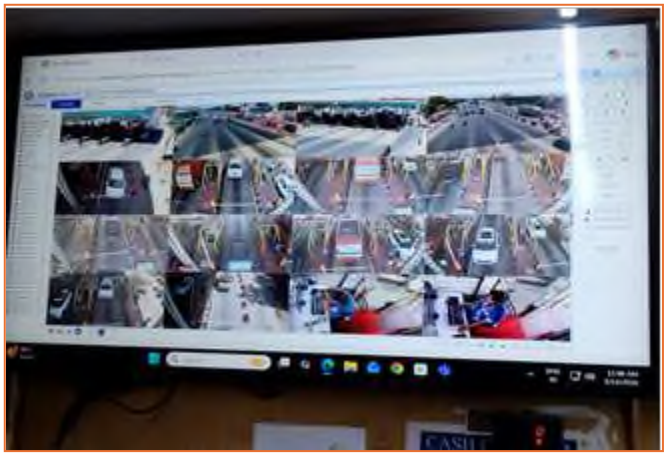
3.12 Plaza Equipment

3.12.1 TMS Server

Plaza Server is provided in a hot standby configuration and provided with port non-POE network switch and Port PoE switch. Internet connectivity is available through one lease line (Airtel) and Jio WiFi module. Firewall with Sophos antivirus is provided.

3.12.2 55” LED screen for CCTV monitoring

55” LED screen for CCTV monitoring installed at the toll plaza admin block provides view of all the toll booths, important zones within the plaza where cash transactions take place (server room, control room, cash up).



The toll plaza manager is able to observe the activities at the toll lanes and toll booth. When the toll collector calls up on the intercom, the manager is able to comprehend the situation at the lane by a zoomed view of the particular lane.

3.12.3 Workstations in Control Room, POS room

Workstations are available in control room (lane monitoring, administration, and audit), cash room and PoS.

3.13 Advanced Traffic Management System (ATMS)

Advanced Traffic Management System (ATMS) installed for the Project Road is controlled by the ATMS center at the toll plaza location (km. 18+935). As per Concession Agreement, ATMS shall conform to ATMS Policy guidelines (2016) which comprises of the following:

Automatic Traffic Counter cum Classifier (ATCC)

- Mobile Radio communication system
- Emergency Call Box
- Portable Weigh in Motion
- Meteorological Data system
- Variable Message Signboards (VMS)
- CCTV system
- Video Incident Detection System (VIDS)
- Vehicle actuated Speed Display (VASD)

Status of these systems at site is described below:

3.13.1 Automatic Traffic Counter cum classifier (ATCC)

Automatic Traffic Counter cum Classifiers (ATCC) is installed at Toll Plaza (km 18+935).

3.13.2 Mobile Radio communication System (MRCS)

Mobile Radio communication System (MRCS) is not yet installed. Application for MRCS UHF band has been sought from WPC, DoT, Ministry of Communications which is not yet allocated.

3.13.3 Emergency Call Boxes (ECB)

ECB's are not installed at site.

3.13.4 Portable Weigh in Motion (PWIM)

PWIM is provided at site and is not functioning.

3.13.5 MET System

Meteorological sensors comprise of sensors to measure the atmospheric temperature, humidity, pavement surface temperature, visibility and equipment for measuring wind speed and direction and installed at Toll Plaza km 18+935.

3.13.6 Variable Message Signboards (VMS)

Variable message sign boards are installed at 11 locations. These display specific messages to the users based on the prevailing conditions on the highway. The message can be changed at any point of time from the HTMS centre. About 250 customised messages can be stored on the system.

3.13.7 CCTV Surveillance Cameras

There are 29 nos. PTZ cameras and 186 VIDS cameras are installed along the Project Road. The ATMS control room has video wall to monitor these locations through the cameras installed. At toll plaza 4 PTZ and 10 lane cover cameras are installed.

3.13.8 Video Incident Detection System

186 fixed CCTV cameras are installed as part of Video incident detection system.

3.13.9 Vehicle Actuated Speed Display (VASD)

VASD is installed at 10 locations each on LHS and RHS.

Actuated Speed Display

3.13.10 Adequacy of Toll Collection System and ATMS

- Adequacy-All lanes are hybrid ETC system as stipulated by NHAI in Technical Specifications of Hybrid ETC system. NHAI has approved maintenance costs for TMS. TMS shall be upgraded every 5 years at the cost of the Authority.

- The Advanced Traffic Management System (ATMS) installed is as per specifications required by the Authority and in working condition.

3.14 Traffic Aid Post and Medical Aid Post

Traffic Aid Post and Medical Aid Posts are under construction at Toll Plaza location.

3.15 Toilet Block

There is one no. of temporary toilet block at Toll Plaza. The same is maintained by the Concessionaire.

3.16 Bus Bays and Passenger Shelters

There are 27 Nos. of bus bays / passenger shelters along Project Road.

3.17 Balance Work Status

There is no balance work to be executed as per the Concession Agreement.

It is to be noted that at present, at three different locations along the Project Road, NHAI has allotted extra / COS works to third party on stand-alone basis. For these 3 locations, along the project length, underpass & approach construction is being carried out by the third party. Thus, a total length of 4.31 km of project length (where COS / new construction works are in progress), out of total project length of 52.30 km is not under the maintenance scope of the Concessionaire at present.

3.18 Operation and Maintenance

3.18.1 O&M Contract

As per Clause 15.1 of the Concession Agreement, the Concessionaire shall operate and maintain the Project Road by itself, or through O&M Contractors and if required, modify, repair, improve the Project Road to comply with Specifications and Standards, and other

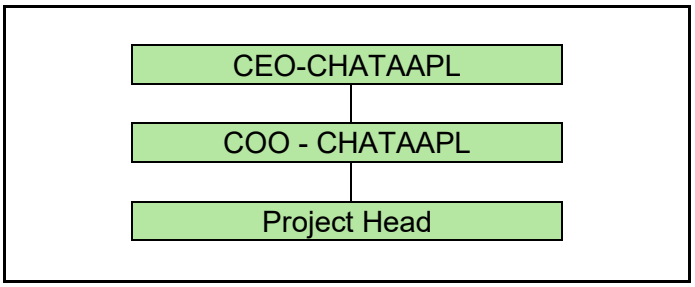
requirements set forth in the Agreement through Good Industry Practice, Applicable Laws and Applicable Permits and manufacturer's guidelines and instructions with respect to toll systems. The Operation and Maintenance activities shall conform to all the requirements laid down in MoRT&H, IRC Specifications and the Concession Agreement.

The Concessionaire has outsourced for carrying out the activities related to operation and maintenance of the Project Road including toll operation services, security services, AMC for TMC and AMC for DG set.

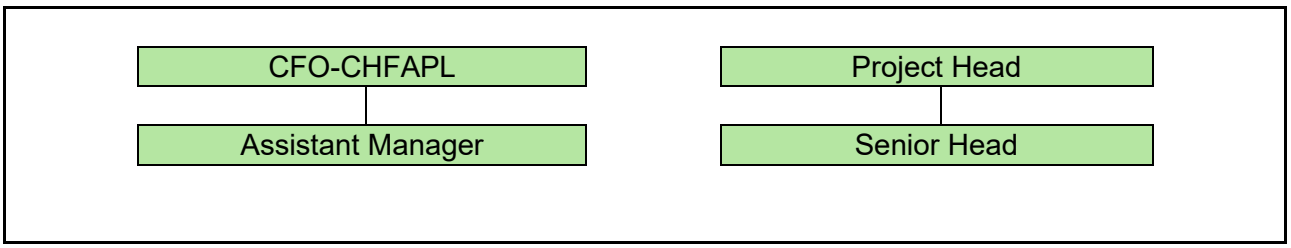
3.18.2 Organization Chart

The Concessionaire has shared the Organization Chart at site for Operation and maintenance. Accordingly, there are 01 Project Head, 01 Senior Executive (HR), 01 Manager (TMS / IT), 01 Executive (TMS / IT), 01 Senior Supervisor, 01 Electrician, 01 Supervisor, 01 Plaza Manager, 01 Assistant Plaza Manager, 01 Document Controller, 03 Cashiers and 03 Validators, 01 Traffic and Road Safety Manager to carry out O&M activities. The team controls the maintenance activities. However, the maintenance work is undertaken and executed through competent sub-contractors.

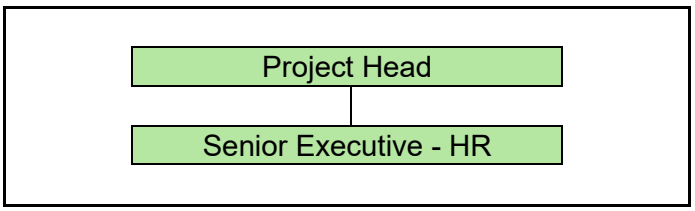
Organization Chart

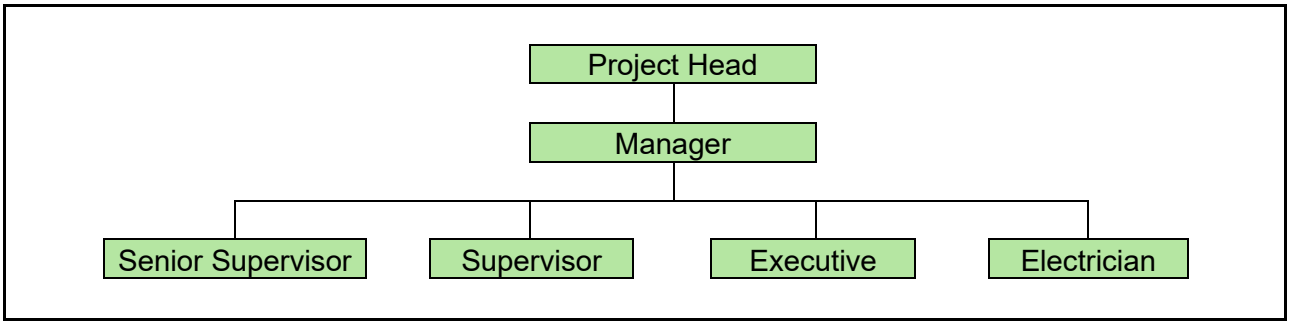


Finance & Accounts

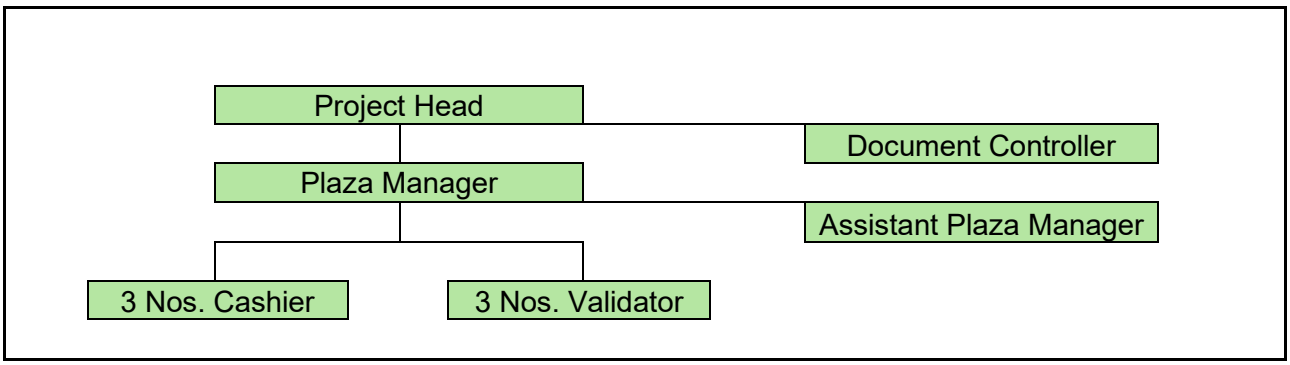


Human Resource Maintenance

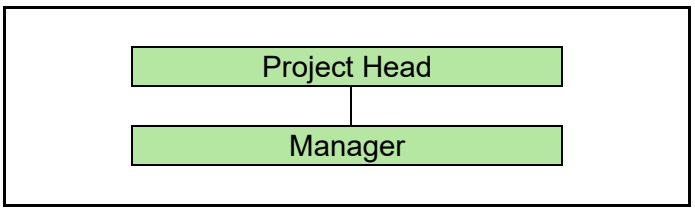




Operations



Traffic & Road Safety



3.18.3 Operation

Operation cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses and other miscellaneous expenses. The Concessionaire has provided the expenses occurred towards operation expenses for past years. Necessary assumptions have made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on the best industry practices and are compared with the operating cost in the vicinity of the project area.

The Operation Cost is presented in the subsequent chapter.

3.18.4 Routine Maintenance

The Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey.

Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been

used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

Currently, the entire length of the Project Road is maintained by Concessionaire.

The Routine Maintenance Cost is presented in the subsequent chapter.

4 PAVEMENT INVESTIGATION AND ASSESSMENT

4.1 General

Article 15 and Schedule-F of the Concession Agreement define the Operation and Maintenance requirement during the concession period.

The project is currently under the Operation and Maintenance stage. The Concession Period of the project is 30 years from the Appointed Date (as TOT Package i.e., 20th October 2020) including construction period.

4.2 Axle Load and VDF

The Concessionaire has conducted the Axle Load Survey on Project Road at km. 18+975 (near Toll Plaza) on 12th March 2020 and 14h March 2020. The summary of Vehicle Damage Factor (VDF) calculated as provided by the Concessionaire is tabulated below.

Table 4-1 Vehicle Damage Factor

Weighted Average VDF Values			
Sr. No.	Vehicle Type	Direction	
		Madurai - Kanyakumari	Kanyakumari - Madurai
1	BUS	1.012	0.848
2	LCV	0.655	0.682
3	2-Axle	2.201	3.238
4	3-Axle	5.018	5.994
5	MAV	11.958	7.918

4.3 Design Traffic

Traffic in Million Standard Axles (MSA) for the homogeneous section based on the historical traffic data as provided by the Concessionaire, current traffic has been used for future projections and the estimated design MSA is computed and presented in subsequent table.

For the estimation of design MSA, Actual Traffic Growth Rates as provided by the Concessionaire were used.

Table 4-2 MSA Calculation

MSA Calculation					
Year	MSA (LHS)	Cumulative MSA (LHS)	MSA (RHS)	Cumulative MSA (RHS)	Remarks
FY27	3.22	**3.22**	2.83	**2.83**	DPR Preparation
FY28	3.35	**6.57**	2.93	**5.76**	DPR Preparation
FY29	3.47	**10.04**	3.04	**8.80**	Upgradation to 6-Lane & 1st MM Cycle
FY30	3.60	**13.64**	3.14	**11.94**	Upgradation to 6-Lane
FY31	3.73	**17.37**	3.25	**15.19**	Upgradation to 6-Lane
FY32	3.09	**20.46**	2.69	**17.88**	
FY33	3.23	**23.69**	2.80	**20.68**	
FY34	3.34	**27.03**	2.90	**23.58**	
FY35	3.47	**30.50**	3.00	**26.58**	

MSA Calculation					
Year	**MSA**	**Cumulative**	**MSA**	**Cumulative**	**Remarks**
FY36	3.59	**34.09**	3.09	**29.67**	
FY37	3.71	**37.80**	3.20	**32.87**	2nd MM Cycle
FY38	3.84	**41.64**	3.30	**36.17**	2nd MM Cycle
FY39	3.97	**45.61**	3.41	**39.58**	
FY40	4.11	**49.72**	3.51	**43.09**	
FY41	4.24	**53.96**	3.62	**46.71**	
FY42	4.38	**58.34**	3.74	**50.45**	
FY43	4.53	**62.87**	3.85	**54.30**	
FY44	4.67	**67.54**	3.97	**58.27**	3rd MM Cycle
FY45	4.83	**72.37**	4.09	**62.36**	3rd MM Cycle
FY46*	4.98	**77.35**	4.21	**66.57**	End of concession period as per Appointed date & CA

**Actual end of concession period as per Concession Agreement is October 2050. As per recent traffic study conducted by Concessionaire, the revised concession period is upto FY 2046.*

4.4 Network Survey Vehicles (NSV) Survey

Roughness Index

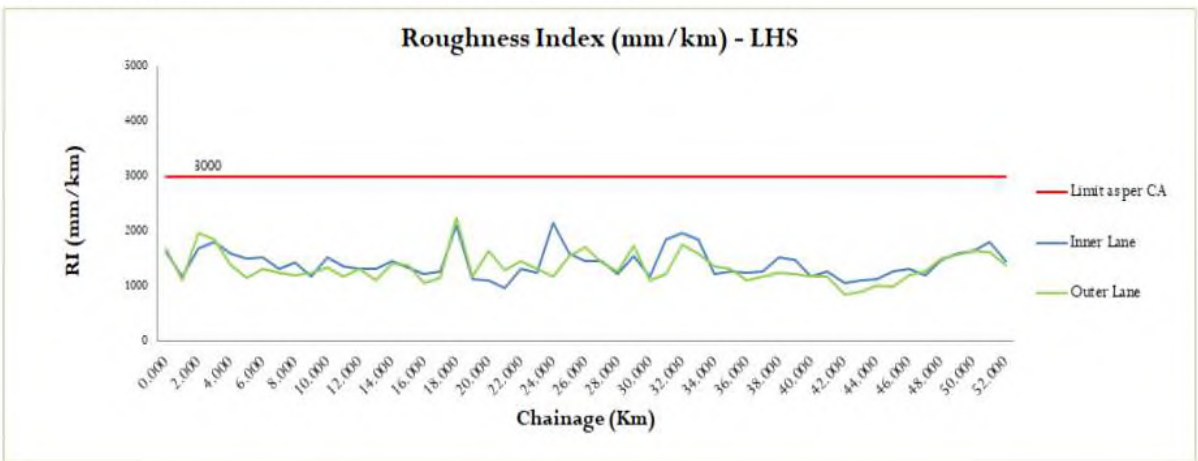
The Concessionaire has conducted pavement condition survey on each lane of carriageway through NSV. The NSV survey was conducted on the Project Road from 5th January 2025 to 18th January 2025. The summary of the same is presented below.

Table 4-3 Summary of Roughness Index

Table 2-1: Summary of RI Limit as per Schedule F of CA

Roughness Summary % as per Schedule F of CA (mm/km)					
Condition	Limit as per Schedule F of CA (mm/km)	LHS		RHS	
		Inner Lane	Outer Lane	Inner Lane	Outer Lane
Good	<3000	100.00%	100.00%	100.00%	100.00%
Poor	>3000	0.00%	0.00%	0.00%	0.00%

Figure 2-3: Roughness Summary for MKTPL as per Schedule F of CA



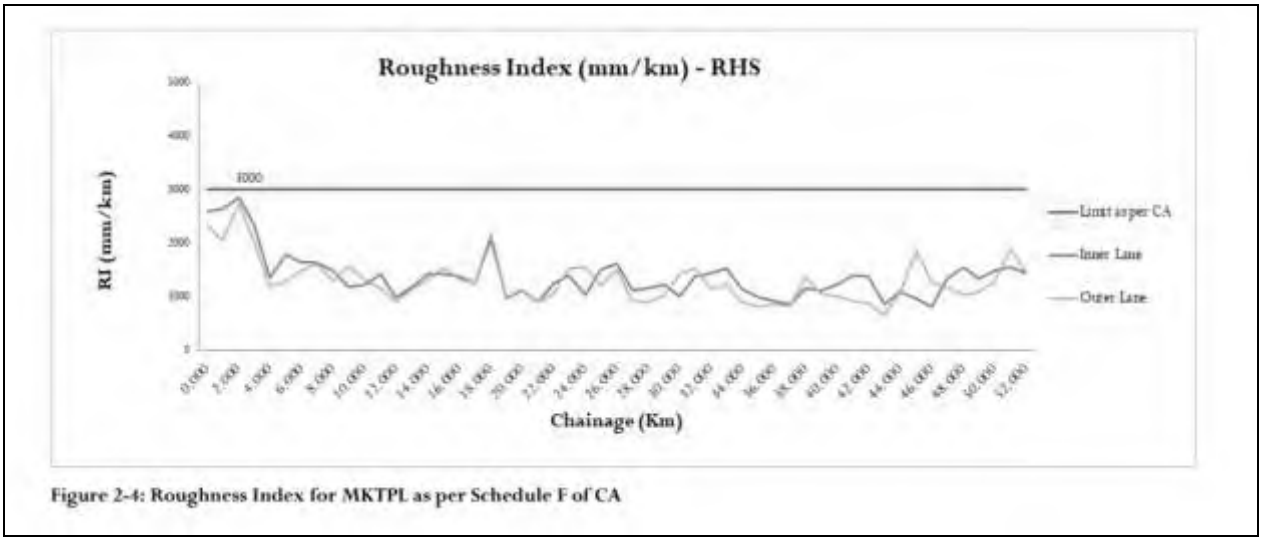


Figure 2-4: Roughness Index for MKTPL as per Schedule F of CA

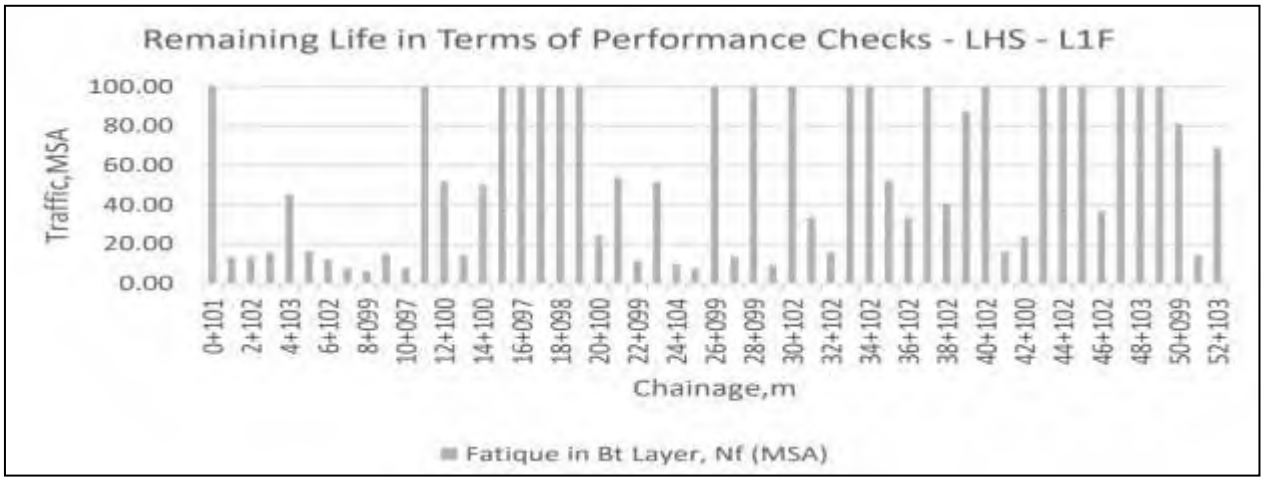
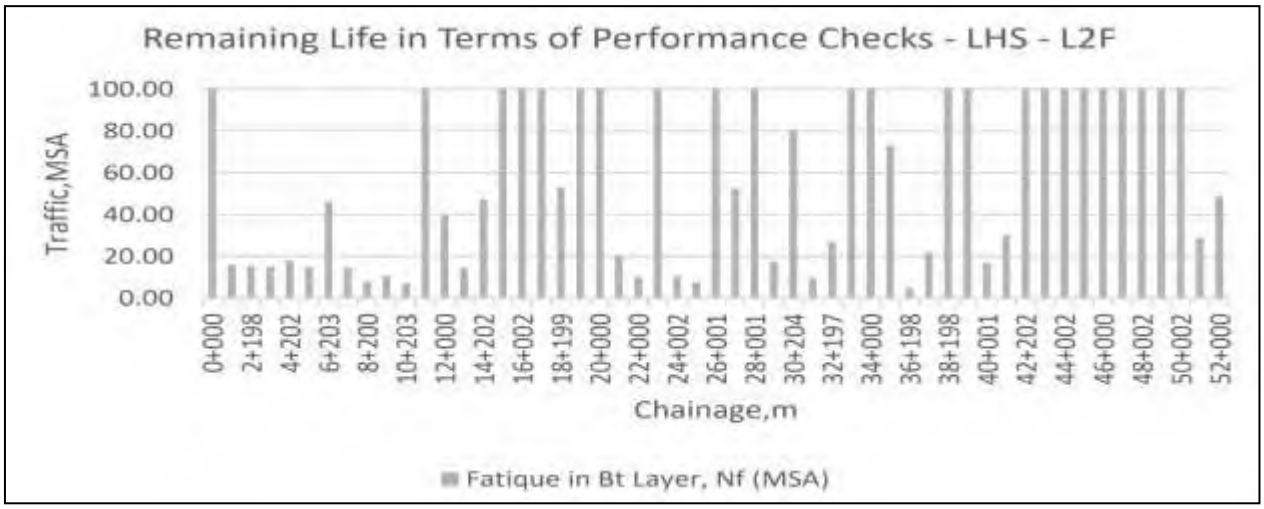
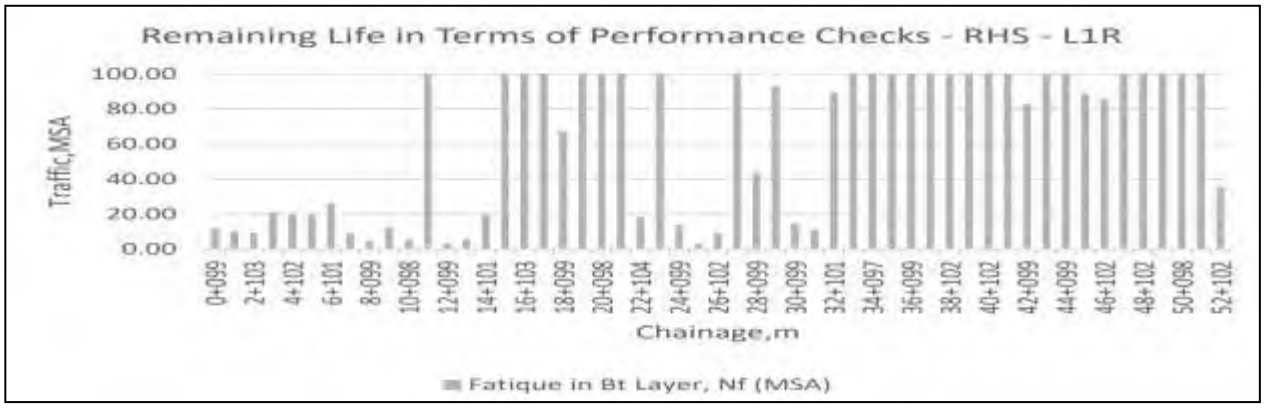
4.5 Falling Weight Deflectometer (FWD) Survey

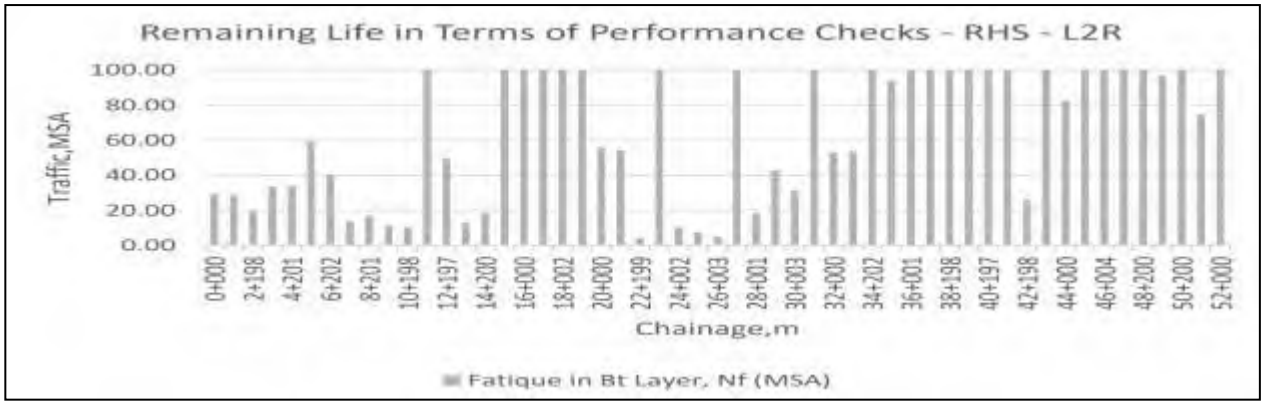
The structural evaluation and analysis of the remaining life of project was carried out in conformity with IRC:115-2014 “Guidelines for Structural Evaluation and Strengthening of Flexible Road Pavements Using Falling Weight Deflectometer (FWD) Technique”.

The FWD survey was conducted on the Project Road on 24th January 2025 to 27th January 2025. The summary of the same is presented below.









However, the maintenance can be carried out on as and when required basis and to the compliance of Schedule-F requirement to maintain the road in serviceable condition. However, improvement in Riding Quality is expected if the roughness value exceeds 3000 mm/km.

4.6 Test pit and Subgrade Investigation

The Concessionaire has carried out the subgrade investigation for Project Road. The results of the same as provided by the Concessionaire are tabulated as below.

CBR Analysis

Sr. No.	Road Name	Existing Chainage (km)	Side	DCP-CBR
1	NH-7	0+000	LHS	24.7

4.7 Periodic Maintenance Strategy

Unlike the old Concession Agreements where periodicity and threshold limits were clearly described for the major maintenance, the Concession Agreement of this project does not specify the periodicity or the threshold limits for carrying out the full length periodic maintenance. Schedule-F of the Concession Agreement specifies the threshold limits and the timeline for carrying out repairs to the distresses during the operation period.

The maintenance thus can be carried out as and when required basis and to the compliance of Schedule-F requirement to maintain the road in serviceable condition. Only improvement to Riding Quality is expected if the roughness value exceeds 3000 mm/km.

Overlay laying work on LHS and RHS is completed at site in the month of October 2021. Means Financial year FY 2022, so that as per our experience next overlay cycle has come in the FY 2029.

As per Article 14 of CA, Authority shall carry out capacity augmentation under EPC contract if traffic exceeds 40,000 PCU for three consecutive accounting years. Recent traffic study reveals that, the project traffic crosses 40,000 PCU in FY 2025, FY 2026, FY 2027. Assumption has made that execution of 6-laning of Project Road will start in the year FY 2029 or FY 2030. It is also assumed that during 6-laning of Project Road, overlay of existing four lane road will be the part of the capacity augmentation. Hence, the major maintenance cycle is adjusted accordingly.

The summary of the major maintenance planned up to end of concession period is presented in the below table.

Table 4-5 Major Maintenance Cycle

Sr. No.	Year	Main Carriageway	Service Road
1	FY 2027 to FY 2028	-	
2	FY 2029	Major maintenance with 30 mm BC with PMB (100%) + Milling & 50 mm DBM (9%)	Major maintenance with 30 mm BC with VG-40 (50%) + Micro-surfacing (50%)
3	FY 2029 to FY 2031	Assumption of Capacity Augmentation to Six Lane Configuration	
4	FY 2032 to FY 2036	-	
5	FY 2037	Major maintenance with 30 mm BC with PMB (100%) + Milling & 50 mm DBM (10%)	Major maintenance with 30 mm BC with VG-40 (50%) + Micro-surfacing (50%)
6	FY 2038 to FY 2043	-	
7	FY 2044	Major maintenance with 30 mm BC with PMB (100%) + Milling & 50 mm DBM (10%)	Major maintenance with 30 mm BC with VG-40 (50%) + Micro-surfacing (50%)
8	FY 2045	-	
9	FY 2046*	End of concession period	

**Actual end of concession period as per Concession Agreement is October 2050. As per recent traffic study conducted by Concessionaire, the revised concession period is upto FY 2046.*

Note: *As per traffic data provided by the Company, 6-laning of the Project Road is expected to commence in FY 2029. Accordingly, the preparation of Detailed Project Report (DPR) is expected to commence in FY 2027 i.e., in the current year. However, there is no such activities for preparation of DPR is observed at site. It is assumed that the upgradation to 6-laning may be delayed. Hence, the major maintenance cycle has been considered in FY 2029.*

The projected cost for periodic / major maintenance is presented in the subsequent chapter.

5 COST ESTIMATES

5.1 General

Based on the assessment carried out in previous chapters, various costs were worked out. The costs are divided into following categories.

I. Balance Works Cost
II. Routine O&M Cost
III. Major Maintenance Cost
IV. Periodic Replacement of TMS / ATMS system

Costs for different category are detailed out in subsequent sections along with the assumptions considered for rate and escalation.

5.2 Rate Assumption

Following assumptions are considered for unit rates of various items while estimating the cost:

1. Unit rates of different items (BC, DBM, Concrete, Road markings etc.) are calculated as per the MoRTH Standard Data Book 2019. The input rates for MoRTH standard data book were adopted as below:

   a. **Manpower and labour:** As per applicable minimum wages published by Ministry of Labour & Employment, Government of India.

   b. **Bitumen:** Concessionaire has long term contract with IOCL for the procurement of bitumen and related products. Same discounts are considered on bitumen procurement for this analysis. Furthermore, we also understand that bitumen prices are primarily dependent on crude oil price and market demand and hence are likely to be very volatile and difficult to predict at this stage.

      Therefore, bitumen prices are considered as per the forecast of Client. Current published of bitumen are considered for unit rates calculation for FY 2027. Average 10 years of price of bitumen are considered for unit rates calculation for FY 2028 and onwards, since bitumen prices have been range bound over the last five-six years. Following rates of bitumen are considered.

Table 5-1 Bitumen Rates - Ex-MI Supply excluding discount and GST

Supply Location	Applicability of Rates	Product	Current Published Price (16th Feb 26)	Long term price (Avg last 10 years)
Mathura	All States	VG-10	45,102	35,125
		VG-30	46,402	36,137
		VG-40	48,962	38,131
Panipat	All States	VG-10	45,102	35,125
		VG-30	46,402	36,137
		VG-40	48,962	38,131
Koyali	All States	VG-10	47,102	37,125
		VG-30	48,402	38,137

Supply Location	Applicability of Rates	Product	Current Published Price (16th Feb 26)	Long term price (Avg last 10 years)
		VG-40	51,082	40,251
Haldia	All States	VG-10	46,602	35,683
		VG-30	47,402	36,295
		VG-40	49,962	38,256
Barauni	All States	VG-10	47,132	36,213
		VG-30	48,432	37,325
		VG-40	50,992	39,286
CPCL	Kerala	VG-10	47,402	35,519
		VG-30	48,402	36,395
		VG-40	50,762	38,120
CPCL	Tamil Nadu	VG-10	47,902	36,019
		VG-30	48,402	36,395
		VG-40	50,962	38,320
CPCL	Telangana and Andhra Pradesh	VG-10	44,602	32,719
		VG-30	45,402	33,395
		VG-40	47,962	35,320
CPCL	Karnataka	VG-10	44,602	32,719
		VG-30	45,402	33,395
		VG-40	47,962	35,320

c. **Sand and Aggregate:** Rates are taken from Public works Department Tamilnadu SOR FY 2025-26.

d. **Cement:** Rates are taken from Public works Department Tamilnadu SOR FY 2025-26.

e. **Steel :** Rates are taken from Public works Department Tamilnadu SOR FY 2025-26

f. **Machinery Hire charges:** Hire charges for the machinery are considered in accordance with applicable NHAI Standard data book.

g. **Actual Rates of items as per work order:** The rates of road marking, road stud, kerb raising, micro-surfacing, milling, median filling rates etc. are considered as per the work order shared by the client.

2. Goods and Service Tax (GST) is considered as 18% as per the latest Government Guidelines.

Summary of Unit Rates worked out using Standard Data Book adopted for major items is given below.

Table 5-2 Summary of Unit Rates

Sr. No.	Item Description	Unit	Rates (Rs.)
1	Dense Bituminous Macadam	Cum	9,088
2	Bituminous Concrete (VG-40)	Cum	10,214
3	Bituminous Concrete (PMB)	Cum	12,519

Sr. No.	Item Description	Unit	Rates (Rs.)
4	Milling	Sqm	90
5	Micro-surfacing	Sqm	162
6	Kerb Re-laying	Rmt	330
7	Road Marking on BC surface	Sqm	573
8	Road Marking on micro surface	Sqm	682
9	Road Studs	Nos.	202

5.3 Balance Work Cost

As discussed in the previous chapter, the balance works cost for the Project Road is **NIL**.

5.4 Routine O&M Cost

Routine O&M cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses, horticulture and ROW maintenance, routine maintenance and other miscellaneous expenses. The Concessionaire has provided the major agreements towards operation and maintenance for past years. Necessary assumptions have made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area. Same has been divided into following major heads.

1. Salary and Welfare Expenses
2. Tolling Operations Services
3. Toll Security Services
4. Incident Management & Emergency Services
5. Electricity and Diesel Charges
6. TMS/HTMS/System Expenses
7. Office Operating Expenses
8. Vehicle Running Expenses
9. Professional Fees Expense
10. Community Development
11. Communication Expenses
12. Conveyance Expenses
13. Insurance Expense
14. IE Fees
15. Routine Maintenance Cost (Project Road)
16. Horticulture & ROW Maintenance
17. Miscellaneous including Contingency

In above, the Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey. Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Operation and Maintenance cost (Routine O&M) is presented below. The detailed working of routine maintenance (Sr. No. 15 of below table) is presented in **Annexure-I**.

Table 5-3 Summary of Operation Cost

Sr. No.	Particulars	Amount (FY 2027 to 2032)	Amount (FY 2033 onwards)
1	Salary and Welfare Expenses	1,13,85,000	1,13,85,000
2	Tolling Operations Services	2,89,76,749	2,89,76,749
3	Toll Security Services	58,16,999	58,16,999
4	Incident Management & Emergency Services	2,19,62,820	2,19,62,820
5	Electricity and Diesel Charges	37,63,822	37,63,822
6	TMS / HTMS / System Expenses	70,00,881	75,48,013
7	Office Operating Expenses	37,14,834	37,14,834
8	Vehicle Running Expenses	30,49,800	30,49,800
9	Professional Fees Expense	53,07,491	87,87,514
10	Community Development	13,17,272	13,17,272
11	Communication Expenses	3,62,250	3,62,250
12	Conveyance Expenses	13,17,272	13,17,272
13	Insurance Expense	60,03,756	60,03,756
14	IE Fees	25,55,104	25,55,104
15	Routine Maintenance Cost (Project Road)	2,67,90,729	3,46,16,562
16	Horticulture & ROW Maintenance	1,78,84,717	1,78,84,717
17	Miscellaneous including Contingency	41,01,362	42,62,448
	Total Cost (Rs.)	**15,13,10,858**	**16,33,24,931**
	Total Cost (Cr.)	**15.13**	**16.33**
	Per km Cost (Lakhs)	28.93	31.23

5.5 Major Maintenance Cost

The summary of Major Maintenance Cost is provided as below. The detailed working of the same is presented in **Annexure-II**.

Summary of Major Maintenance Cost

Sr. No.	Year	Major Maintenance Cost (Cr.)	Remarks
1	FY 2027 to FY 2028	-	
2	FY 2029	66.91	1st MM cycle
3	FY 2030 to FY 2036	-	
4	FY 2037	102.85	2nd MM cycle
5	FY 2038 to FY 2043	-	
6	FY 2044	82.27	3rd MM cycle
	Total	**252.03**	

5.6 Periodic Replacement of TMS / ATMS System

Every 7 years, replacement of cost of major TMS / ATMS system is considered. The same is provided as below:

Sr. No.	Year	HTMS O&M / Replacement Cost (Cr.)	Remarks
1	FY 2027	6.25	
2	FY 2034	6.25	
3	FY 2041	6.25	
Total Cost (Cr.)		**18.75**	

5.7 Escalation Assumption

Following escalation has been considered for the O&M cost as provided by Client.

Table 5-4 Escalation

Year	Escalation	Year	Escalation
2025	-	**2041**	3.99%
2026	-	**2042**	3.99%
2027	5.25%	**2043**	3.99%
2028	4.86%	**2044**	3.99%
2029	4.44%	**2045**	3.99%
2030	4.24%	**2046**	3.99%
2031	4.13%	**2047**	3.99%
2032	4.08%	**2048**	3.99%
2033	4.01%	**2049**	3.99%
2034	4.00%	**2050**	3.99%
2035	4.03%	**2051**	3.99%
2036	4.01%	**2052**	3.99%
2037	3.98%	**2053**	3.99%
2038	3.98%	**2054**	3.99%
2039	4.00%	**2055**	3.99%
2040	3.99%	**2056**	3.99%

5.8 Summary of Cost

Different O&M cost have been worked out based on the investigations and assessment on Project Road. Cost for each of the category has already discussed in previous sections. Since the forecasting has been carried out for remaining concession period, the cost is summaries yearly for remaining concession period along with escalation as mentioned in clause 5.7.

Escalated O&M Cost (in INR Cr.)

Sr. No.	Year of expense	FY27	FY28	FY29	FY30	FY31	FY32	FY33	FY34	FY35	FY36	FY37	FY38	FY39	FY40	FY41	FY42	FY43	FY44	FY45	FY46
1	Routine O&M Cost																				
1.01	Salary and Welfare Expense	1.14	1.19	1.25	1.30	1.35	1.41	1.47	1.52	1.59	1.65	1.71	1.78	1.85	1.93	2.00	2.08	2.17	2.25	2.34	2.44

ANNEXURES

ANNEXURE I - ROUTINE MAINTENANCE COST

Routine Maintenance Cost (4-lane)	
Ordinary Repair Cost for Flexible (with GST)	**2,67,90,729**
(inclusive of GST)	**= 5.12 lakhs per km**

CONVERSION FACTORS									
National Highways / State Highways									
Reference cost taken for Two / four lane (7.0 or 14m or 21m) with 1.5m wide shoulders									
(Refer Chapter 6.17 of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 45)									
Sr. No.	**Description for Flexible Pavement**		**Factor**	**Normal** More than 4500 CVD **2,47,605**	**Urban** More than 4500 CVD **2,97,935**	**Project Length (km)**		**Per Year Project Maintenance Cost**	
						Normal	**Urban**	**Normal**	**Urban**
5	Four-lane with divided carriageway	Without paved shoulder	1.53	378836.00	455840.00	-	-	-	-
		Paved shoulder	1.70	420929.00	506489.00	31.94	-	1,34,42,368	-
6	Four-lane with divided carriageway and service lane on either side	Without paved shoulder	2.00	495210.00	595869.00	-	-	-	-
		Paved shoulder	2.20	544732.00	655456.00	-	20.37	-	1,33,48,361
TOTAL							**52.300**		**2,67,90,729**

Routine Maintenance Cost (6-Lane)	
Ordinary Repair Cost for Flexible (with GST)	**3,46,16,562**
(inclusive of GST)	**= 6.62 lakhs per km**

CONVERSION FACTORS									
National Highways / State Highways									
Reference cost taken for Two / four lane (7.0 or 14m or 21m) with 1.5m wide shoulders									
(Refer Chapter 6.17 of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 45)									
Sr. No.	**Description for Flexible Pavement**		**Factor**	**Normal**	**Urban**	**Project Length (km)**		**Per Year Project Maintenance Cost**	
				More than 4500 CVD	More than 4500 CVD				
				2,47,605	**2,97,935**				
						Normal	**Urban**	**Normal**	**Urban**
1	Six lane with divided carriageway	without Paved shoulder	2.09	517495.00	622683.00	-	-	-	-
		with Paved shoulder	2.26	559588.00	673332.00	31.94	-	1,78,70,443	-
2	Six lane with divided carriageway and service lane on either side	without Paved shoulder	2.56	633869.00	762713.00	-	-	-	-
		with Paved shoulder	2.76	683390.00	822299.00	-	20.37	-	1,67,46,119
TOTAL							**52.300**		**3,46,16,562**

Ordinary Repairs

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity**
				More than 4500 CVD
				BT Surface
1	**2**	**3**	**4**	**5**
1	**Maintenance of Carriageway & Paved Shoulders (1.5m wide); B.T. Surface**			
	i) Potholes repair (50 mm deep)	100 % Pothole free	As & when required	1.00%
	Volume (cum)			5.00
	Rs/m^3			11269
	Cost in Rupees			56,345
	ii) Patch repair	100 % Patch less	As & when required	1.00%
	Area (sqm)			100
	Rs/m^2			451
	Cost in Rupees			45,076
	iii) Sealing (Crack)			
	a) Wider than 3 mm	100 % Crack Less	As & when required	2.00%
	Area (sqm)			200
	Rs/m^2			79
	Cost in Rupees			15,810
	b) Width less than 3 mm	75 % Crack Less	As & when required	2.00%
	Area (sqm)			150
	Rs/m^2			53
	Cost in Rupees			7,912
	iv) Repair of ruts and undulations			
	a) Greater than 20 mm	75%	As & when required	1.00%
	Area (sqm)			75
	Rs/m^2			451
	Cost in Rupees			33,807
	v) Road marking	14%	Once in 7th year & @ Repaired location	13793

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity**
				More than 4500 CVD
				BT Surface
1	**2**	**3**	**4**	**5**
	SUB TOTAL			**1,72,743**
2	**Maintenance of earthen Shoulders:**			
	i) Renewal of earthen shoulders	80%	Once in a Year	6306
	ii) Jungle Clearance	100%	Twice in a Year	2069
	iii) Kuccha Drain Maintenance	100%	Twice in a Year	1108
	SUB TOTAL			**9,483**
3	**Maintenance of Cross Drainage works:**			
	i) Cleaning of culvert bed	100%	Once in a Year	2793
	ii) Repair of floors	100%	Once in a Year	5055
	iii) Repair of parapets	100%	As & when required	2106
	SUB TOTAL			9,954
4	**Maintenance of Minor & Major Bridges:**			
	i) Cleaning and removal of dirt & vegetation from pier caps, Bearings, Expansion Joints, Superstructure, Substructure and Retaining wall etc.	100%	As & when required	36,950
	ii) Spot painting & protective Coating required on Bearing and greasing of Bearings, railing, structural members, Expansion joints			
	iii) Repair of minor washouts, erosion scour and animal holes			
	iv) Sealing Cracks with Cement/ Epoxy Mortar			
	v) Replacement & Correction of safety barriers, Guard rails and damaged members			
	SUB TOTAL			**36,950**
5	**Miscellaneous Items:**			
	i) Turfing and Arboriculture		Once in a Year	2463
	ii) Maintenance of gang hut store, sheds, animal &		Once in a Year	3695

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)

1 INTRODUCTION

1.1 Background

Cube Highways Fund Advisors Pvt. Ltd. (hereinafter referred as "the Client") is the Investment Manager of the Cube Highways Trust ("Trust" or "InvIT"). The Trust is registered with Securities and Exchange Board of India ("SEBI") as an Infrastructure Investment Trust under the SEBI InVIT Regulations. Cube Highways Fund Advisors Pvt. Ltd. has appointed **M/s. FP Project Management Consultancy Services Private Limited** (hereinafter referred as "Technical Consultant" or "FPPM") to carry out Technical Due Diligence of National Highway No. 166 including the section from Mangalwedha to Solapur (km. 321+600 to km. 378+100) on Hybrid Annuity Mode in the State of Maharashtra (approx. 56.500 kms) (hereinafter referred as "Project Road").

M/s. DBL Mangalwedha Solapur Highway Private Limited (DMSHPL) (hereinafter referred as "Concessionaire") is a special purpose vehicle (SPV) for development, maintenance and management of National Highway No. 166 including the section from Mangalwedha to Solapur (Sangli Solapur Package-4) on Hybrid Annuity Mode.

The Date of Concession Agreement is 10th May 2018. The concession period of the project is 17 years commencing from the Appointed Date including implementation period. Appointed Date of the project is 23rd May 2019. The Provisional Completion Certificate was issued on 14th December 2021 for the length of 52.760 km out of 56.500 kms. The project has also received Final Completion Certificate for the length of 55.800 kms with effective from 01st March 2023.

Sr. No.	Description	Date
1	Date of Signing the Concession Agreement	10th May 2018
2	Appointed Date	23rd May 2019
3	Scheduled Project Completion Date	21st May 2021
4	Scheduled End of Concession	18th May 2036
5	Date of issue of Provisional Completion Certificate	14th December 2021
6	Date of Commencement of Commercial Operation	14th December 2021
7	Date of Issue of Completion Certificate	1st March 2023

Presently, the project is under operation and maintenance and the Technical Consultant has undertaken the work of assessment of operation and maintenance (O&M) cost based on site inspections and field investigations. The same is presented in this report.

1.2 Scope of Work

The detailed scope of work for conducting the technical due diligence of Project Road is presented as below:

- A reconnaissance of the Project Road to understand the current condition of the pavement, structures, road furniture, toll plaza and other highway assets.
- Review and assessment of important technical documents like CA, pavement design report, O&M report, DPR, As-built drawings, O&M manual, COD / PCOD certificate, punch list, previous major maintenance etc.,
- Review of recent pavement investigations and surveys conducted on Project Road like FWD, NSV, axle load, material investigations etc.,
- Formulation of future major maintenance strategy

- Estimation of any initial expenses to be incurred due to deficiencies observed in diligence
- Estimation of Routine Maintenance and Major Maintenance forecast for remaining concession period
- Estimation of Annual Operation expenses along with Systems cost (TMS / HTMS) till the end of concession period

1.3 Our Approach Philosophy

1.3.1 Composition of Team

Our team consists of well-qualified Engineers and other professionals, whose experience covers all the skills and specializations required for undertaking such assignments. All the team personnel proposed are our regular employees and have a long and stable working relationship with our firm.

The Team Leader coordinates the activities between all the key staff who work closely together. The key staff is assisted by various support staff, who report to the respective key staff in their field of expertise. The Team Leader is the point of contact for Client on Technical Study.

The technical study includes review of all the available documents namely:

a) Concession Agreement including Technical Schedules
b) O&M Contract, work order and their provisions
c) Quality of construction based on available data, design and drawings
d) Documents on historical expenditure on operation and maintenance
e) O&M cost schedule for the concession period
f) Review of Completion / Provisional Completion along with punch list items
g) Review of recent pavement surveys conducted
h) Correspondence regarding scope of works and during O&M
i) Recent O&M Report submitted to Authority
j) Toll operation manual / ATMS related documents

The review of above documents is the first step towards accomplishment of the task. This gives a complete idea of the project and is used as input data for preparation of report after necessary analysis.

1.3.2 Site Visit and Data Collection

A team of experts from various streams has carried out the preliminary site visit to understand the assessment of project assets, mainly condition of the pavement and structures.

- The site visit is undertaken for detailed reconnaissance and visual pavement condition assessment.
- The condition assessment of major structures by visual inspection
- The information like material sources and the probable cost is collected for the purpose of cost estimates.

The detailed design / drawings viz. Plan & L-sections, drainage design, structure design, layout drawings for project facilities like toll plaza, bus bay, truck lay-byes, highway lighting facilities etc. are studied. Also, design / drawing and provision pertaining to road furniture are studied.

The information on availability of material in the vicinity is gathered. It has direct impact on cost of maintenance work and balance work.

The basic approach for preparation of cost estimates for operation and maintenance is as per the practice of State PWD / MORT&H in respect of highways and structures.

1.3.3 Data Analysis

Based on the study of the available information and preliminary site visits, the consultants share their preliminary observations with the Client based on the evaluation of the technical data and reports provided by the Client.

1.4 Structure of the Report

This report has been prepared based on the information, reports and documents made available to us by the Client. We have also referred to publicly available reports, literature etc. and have made our best efforts to check the authenticity of the information available, analyses the same as per the best engineering / industry practices.

The site visit and inspection of the project site was carried out during the period from **7th March 2026 to 8th March 2026**.

The report is organized with the following chapters for easy understanding of various issues.

Chapter 1 **Introduction:** The chapter gives an overview of the project background, detailed scope of work, approach, and methodology for technical due diligence study**.**

Chapter 2 **Project Description:** The chapter describes existing project features, overview of project development etc.

Chapter 3 **Condition Assessment of Project Road:** The chapter presents the details and condition of various essential features of the Project Road based on the site visit**.**

Chapter 4 **Pavement Investigation and Assessment:** This chapter describes the summary of pavement surveys and investigations carried out on Project Road along with the requirement of pavement maintenance

Chapter 5 **Cost Estimates**: This chapter summarizes the forecast for O&M and major maintenance costs over the remaining concession period

2 PROJECT DESCRIPTION

2.1 Introduction

National Highways Authority of India signed the Concession Agreement with **M/s. DBL Mangalwedha Solapur Highway Private Limited (DMSHPL),** is a company promoted by Cube Highways or company a Special Purpose Vehicle (SPV) formed for implementing this project on 10th May 2018.

2.2 Location

The Site of the Four-Lane divided Project Road comprises the section of National Highway 166 commencing from Design km. 321+600 at Mangalwedha to Design km. 378+100 (Approx Length is 56.500 kms) at Solapur in the State of Maharashtra.

The Location Map of the Project Road is presented below:

Figure 2-1 Location Map

The photographs taken during the site visit are presented below.

Figure 2-2 Start of the Project Roads

Start of Project at km. 321+600 (LHS & RHS)

Figure 2-3 End of Project Road

End of Project at km. 377+400 (LHS) **End of Project at km. 377+400 (RHS)**

2.3 Climate

The project location has three distinct seasons: summer, monsoon and winter. Typical summer months are from March to May, with maximum temperatures ranging from 30 °C to 45 °C. The monsoon lasts from June to the end of September, with moderate rainfall. The project location receives an average rainfall of 545 mm (21.5 in) per year. Winter begins in November and lasts until the end of February with the temperatures occasionally dropping below 10 °C (50 °F).

2.4 Terrain

The Project Road traverses through plain / rolling terrain.

2.5 Abutting Land Use

The Project Road passes through residential and agricultural zones.

2.6 Right of Way

The width of the existing Right of Way (RoW) varies from 20 m to 30 m in rural areas and 20 m to 25 m in built-up areas, except Toll Plaza area.

2.7 Existing Utilities

During the widening of the Project Road, various affected utility services located along the Project Road were shifted out / at the edge of the ROW. The different types of utilities found along the road include, electrical poles, telephone poles, hand pumps, permanent structures, temples etc.

2.8 Service Road

The total length of service road on both sides is 30.098 kms.

2.9 Development as per Schedule-B

The Project Road from Design Chainage km. 321.100 at Mangalwedha to Design Chainage km. 378.100 at Solapur (Approx Length is 56.500 kms) has been developed as a four-lane paved carriageway 18.0m wide excluding median. The Project Road passes through rural as well as built-up sections.

As per Article 2 of Concession Agreement, the scope of project defined in Schedule-A and Schedule-B, (the **"Scope of the Project"**) shall mean and include, during the concession period:

a) Construction of the project on the Site set forth in Schedule-A and as specified in Schedule-B together with provision of project facilities as specified in Schedule-C and in conformity with the Specification and Standards set forth in Schedule-D.
b) Operation and maintenance of the Project in accordance with the provisions of this Agreement.
c) performance and fulfilment of all other obligations of the Concessionaire in accordance with the provisions of the Concession Agreement and matters incidental thereto or necessary for the performance of any or all of the obligations of the Concessionaire under the Concession Agreement.

Following is the Scope of Work as per Schedule-B of Concession Agreement.

Table 2-1 Details of Scope of Work

Sr. No.	Particulars	Unit	Scope as per Schedule-B	Constructed as per site
1	O&M of Main Carriageway	Km	56.500	55.800*
2	Service road / Slip Road	Km	30.098	29.909
3	Rail Over Bridge (ROB)	Nos.	01	Descope
4	Major Bridge	Nos.	03	03
5	Minor Bridge	Nos.	18	18
6	Vehicular Underpass	Nos.	4 + 1 (COS)	05
7	Light Vehicular Underpass	Nos.	13 - 1 (COS)	12
8	Slab and Box Culverts	Nos.	12	12
9	Hume Pipe Culverts	Nos.	92	92

** 0.700 km length is Descoped from total length of the Project. Project has received Completion Certificate for the length of 55.800 km.*

3 CONDITION ASSESSMENT OF PROJECT ROAD

3.1 Pavement

The paved carriageway is 18.0 m wide excluding the median. The project is widened to a four lane-carriageway with a width of 18.0 m as per standard cross section including paved shoulders. Service / Slip Road of 7.5 m width has been provided on one side or both sides wherever required in built-up area to cater for the local traffic.

The entire stretch of Project Road, Service / Slip Road and Toll Plaza are constructed with rigid pavement. Rigid pavement for main carriageway and service / slip roads are designed for a design life of 30 years.

3.1.1 Pavement Condition Survey

A pavement condition survey was carried out from **7th March 2026 to 8th March 2026** through visual inspection for the entire project length. From the visual inspection, the pavement condition of the Project Road is found to be Good. The total project length of 55.800 kms is in good condition. During the site visit, at some locations cracks are observed on the pavement. However, rectification work is in progress at such location of the Project Road.

Some of the photographs taken during the site visit are presented below.

Figure 3-1 Photographs of Pavement Condition (Main Carriageway)

Pavement Condition at km. 376+420 (RHS)

Pavement Condition at km. 363+280 (LHS)

Pavement Condition at km. 354+200 (RHS)

Pavement Condition at km. 346+900 (LHS)

Pavement Condition at km. 342+010 (RHS)

Pavement Condition at km. 335+400

Pavement condition at km. 332+730 (LHS)

Pavement Condition at km. 328+200 (LHS)

3.2 Service Road / Slip Road

The service / slip road of width 7.5 m is constructed in built-up areas and adjoining underpass locations. The Project Road has total service / slip road length of 29.909 kms.

The photographs taken during the site visit are presented below.

Figure 3-2 Photographs of Service Road

Pavement Condition at km. 367+ 450 (RHS)

Pavement Condition at km. 367+040 (LHS)

Pavement Condition at km. 356+800 (RHS)

Pavement Condition at km. 338+600 (RHS)

Pavement Condition at km. 326+950 (RHS)

3.3 Major / Minor Intersection

There are 01 no. of major junction and 90 nos. of minor junctions along the Project Road.

The photographs taken during site visit are presented as below.

Figure 3-3 Photograph of Major Junction

Solapur Vijapur Highway Underpass Crossing at km. 370+400

Figure 3-4 Photographs of Minor Junctions

T-Junction at km. 342+370 (RHS)

T-Junction at km. 331+800

Junction at km. 339+810 (RHS)

3.4 Inventory and Condition Survey of Structures and Bridges

The inventory of structures including major bridges, minor bridges, underpasses and culverts is presented in table as below:

Table 3-1 Details of Summary for Structures

Sr. No.	Particulars	Unit	Total Number of Structures As per CA	Total Number of Structures as per site
1	Rail Over Bridge (ROB)	Nos.	01	Descope
2	Major Bridge	Nos.	03	03
3	Minor Bridge	Nos.	18	18
4	Vehicular Underpass	Nos.	4 + 1 (COS)	05
5	Light Vehicular Underpass	Nos.	13 - 1 (COS)	12
6	Slab and Box Culverts	Nos.	12	12
7	Hume Pipe Culverts	Nos.	92	92

All major structures and CD works were visually inspected. The CD structures are generally sufficient for storm water drainage. The waterway needs regular cleaning. All the old bridges are 2-lane and are widened to 2 additional lanes. The type of foundation for these structures is open foundation. At some of the bridges, settlement in approaches and cracks in the pavement has been observed which need to be repaired. New bridges are constructed in 2-lane with footpath keeping a provision of converting into 3-lane in future. The wearing course and expansion joints are found in good condition. Crash barriers are RCC type and are in sound condition. Return wall are of RCC type and pitching has been provided in almost all bridges. RE walls are provided for the approaches of the structure.

The detailed condition survey of major bridges, minor bridges, flyovers and culverts was carried out by visual inspection. The observations and findings are presented below.

3.4.1 Cross Drainage (Bridges and Culverts)

Slab culverts are visually inspected. Some culverts are old and widened. The old structures have been strengthened with repair and rehabilitation during widening. The widening is either concentric or eccentric. The quality of concrete of abutment, slab, and wing wall, or return wall, parapet wall is satisfactory. The slope protection has been done at major locations. The slopes are stable. Generally, all the slab culverts are found in

sound condition. The waterway needs to be cleaned on both sides of the culverts. Box culverts are visually inspected. The RCC box culverts are retained and widened. The RCC quality of new box culverts is good. The structure number is painted on the parapet wall or crash barrier in most of the culverts. The waterway is clear in some of the culverts and needs to be cleared for a few culverts, particularly in urban areas.

Pipe culverts are visually inspected. The pipe culverts are either newly constructed or reconstructed. Some of the pipe culverts are retained and widened. The widening is either concentric or eccentric. In most of the culverts, the ends are blocked by debris, garbage or vegetation especially in urban areas or buried underground. Regular cleaning of the waterway is required to avoid damage to pavement.

The following photographs were taken during the inspection of culverts.

Figure 3-5 Photographs of Culverts

Box Culvert at km. 374+980 (RHS)

Pipe Culvert at km. 371+080 (RHS)

Box Culvert at km. 370+039 (RHS)

3.4.3 Major Bridge (length > 60 m)

There are 03 Nos. of Major Bridges on Project Road, out of which 2 Nos. are new construction and 1 No. is widening of existing Major Bridge. All Major Bridges are visually inspected. The structures are generally sufficient for the crossing of river water. The waterway needs regular cleaning. Old structures are present on the right side of locations. The old bridges are 2-lane with footpaths. Old bridges have RCC railing. The sub-structures are constructed with RCC piers. The expansion joints in the bridges need to be cleaned. Minor settlement in approaches has been observed. New bridges are constructed in 2-lane with footpath. Old bridges on RHS have RCC pier and T-beam girders. The wearing course and expansion joints are found to be in good condition. W-beam and RCC type crash barriers are in sound condition. Drainage spouts need to be cleaned regularly. Further, vegetation and silt need to be removed from the waterway for smooth flow of water.

Table 3-3 Details of Major Bridges

Sr. No.	Design Chainage (km)	New Chainage (km)	Type of Structure	No. of Span	Span Arrangement (m)	No. of Lane	Side	Construction Scheme	TDD Consultant's Remarks
1	331+563	339+050	Major Bridge (Bhima River)	8	8 x 30.00	2	LHS	New Construction	The structure is in good condition. RCC railing & Concrete crash barriers are in good condition. Waterway cleaning is required.
				8	8 x 30.00	2	RHS	New Construction	The structure is in good condition. RCC railing & Concrete crash barriers are in good condition. Waterway cleaning is required.
2	357+352	364+829	Major Bridge (Sina River)	7	7 x 32.00	2	LHS	New Construction	The structure is in good condition. RCC railing, Concrete crash barriers are in good condition. Cleaning of Expansion joint is required.
				7	7 x 32.00	2	RHS	New Construction	The structure is in good condition. RCC railing, Concrete crash barriers are in good condition. Cleaning of Expansion joint is required.
3	366+354	373+943	Major Bridge (Adila Nala)	11	-	2	LHS	Old Construction	The structure is in sound condition. Pipe railing is in good condition. Vegetation over the structure needs to be removed, reinforcement is exposed at some locations which needs to be rectified. Pavement over the structure is in good condition.
				6	6 x 19.60	2	RHS	New Construction	The structure is in good condition. RCC railing, Concrete crash barriers are in good condition. Cleaning of Expansion joint is required.

3.4.6 ROB

There was 01 No. of ROB on Project Road at km. 377+800 as per the Concession Agreement. Due to some issues, the Authority has de-scoped the construction of ROB.

Table 3-6 Details of ROB

Sr. No.	Design Chainage (km)	Type of Structure	No. of Span	Span Width (m)	Length (m)	No. of Lane	Construction scheme	TDD Consultant's Remarks
1	377+800	ROB	1	25.00	64.01	4	New Construction on LHS & Re-construction on RHS	De-scoped

3.5 Drainage

Drains are constructed at the Project Road to have good drainage. Covered lined drains are provided at the sides of the service. Median cut drains are provided at superelevation locations. Chute drains are also constructed at a high embankment portion of the Project Road. The drainage condition of Project Road is in order. Silt deposits need to be removed during routine maintenance. Earthen drains are also provided in rural areas. The condition of the same is good to fair.

The photographs taken during the site visit are presented below.

Figure 3-10 Photographs of Drainage

Earthen Drain km. 371+060 (RHS)

Chute Drain provided at slope at km. 364+500 (RHS)

RCC Drain at MCW km.375+000 (RHS)

RCC Drain at Service Road at km. 370+036

3.6 Slope Protection

Slope protection is found on Project Road at some locations. At a few locations, the slope protection is damaged, which needs to be rectified by the Concessionaire.

The photographs taken during the site visit are presented below.

Figure 3-11 Photographs of Slope Protection

Slope Protection at km.364+600 (LHS)

Slope Protection at km. 347+200

3.7 Road Furniture

3.7.1 Pavement Marking

Pavement marking for the Project Road is done as per the design standards. Pavement marking has faded out at some locations which need to be rectified by the Concessionaire.

Some of the photographs of road marking are presented below.

Figure 3-12 Photographs of Road Marking

Pavement Marking km. 326+950 (RHS)

Pavement Marking at km. 322+250 (LHS)

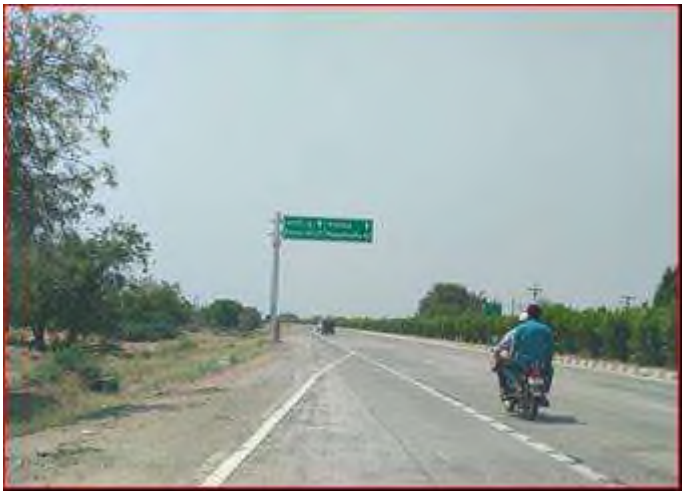
3.7.2 Traffic Signage

Traffic signs include roadside signs, overhead signs, kerb mounted signs and median signs along the Project Road. The design for the traffic signs along the Project Road is done as per the design standards.

Some of the photographs of traffic signage are presented below.

Figure 3-13 Photographs of Traffic Signage

Hazard Marking Sign board at MNB km. 331+469



Informatory Sign board at km. 363+700 (RHS)

3.7.3 Highway Lighting

Highway Lighting is provided in urban and semi-urban areas of the Project Road. Lighting is provided at the locations of truck lay-bye, bus bay, toll plazas, underpasses, service road stretches and at intersections / interchanges. IS:1944 (Part I and II) is followed for lighting installations. High mast lighting systems are provided at toll plaza.

Some of the photographs taken during site visit are presented below.

Figure 3-14 Photographs of Highway Lighting

Highway Lighting at km. 375+050 (Median)

Highway Lighting at km. 364+600 (Median)

3.7.4 Road Studs / Cat eyes

The Concessionaire has provided cat's eyes / studs as per Schedule-D on the curves, road junctions, zebra crossings, in municipal area and village settlement and ramps etc. to provide the proper visibility to the road users.

Some of the photographs taken during site visit are presented below.

Figure 3-15 Photographs of Road Studs

Road Studs on Project Road at km. 375+005

Road Studs on Project Road at km. 336+600 (RHS)

3.7.5 Pedestrian Guard Rail

The pedestrian guard rails are provided between main carriageway and service road at built-up locations. The pedestrian guard rails are observed to be in good condition.

Some of the photographs taken during site visit are presented below.

Figure 3-16 Photographs of Pedestrian Guard Rail

Pedestrian Guard Rail at km. 337+900 (RHS)

Pedestrian Guard Rail at km. 337+900 (LHS)

3.7.6 Avenue Plantation and Median Plantation

Avenue plantations and median plantation are done along the project length except at built-up locations as per IRC specification. Median Plantation needs proper regular maintenance. Avenue plantation work is provided at required locations.

Some of the photographs taken during site visit are presented below.

Figure 3-17 Photographs of Avenue and Median Plantation

Median Plantation at km. 369+400

Avenue Plantation at km. 371+060 (RHS)

3.7.7 Traffic Signage / Median kerb painting / KM Stone

Traffic signs include roadside signs, overhead signs, kerb mounted signs and median signs along the Project Road. The design for the traffic signs along the Project Road is done as per the design standards indicated in section 11 of Schedule-D.

The height, lateral clearance, location and installation are as per relevant clauses of Schedule 'D'. Overhead sign has been installed ahead of major intersections, toll plazas, start / end of Project Road and urban areas as per detailed design requirements.

Median kerb paint is found faded at few locations which will be rectified by the Concessionaire.

Some of the photographs of sign boards are presented below.

Figure 3-18 Photographs of Road Signages

Hazard marking signage at km. 375+020

Kerb Painting & Hectometer Stone at km.336+600 (Median)

RBS stone at km. 372+000 (RHS)

Overhead Gantry on Project Road at km. 336+600 (LHS)

3.7.8 Crash Barriers

Metal beam crash barriers are provided at bridge approaches, locations of high embankment and sharp curves. All the crash barriers provided by the Concessionaire are maintained at site.

Some of the photographs of metal beam crash barriers are presented below.

Figure 3-19 Photographs of MBCB / Crash Barrier

MBCB provided in Shoulder at km. 364+400 (RHS)

MBCB provided at km.339+790 (RHS)

3.7.9 Delineators

The traffic delineators are provided by Concessionaire on the Project Road for road users. The same are maintained by the Concessionaire.

Some of the photographs of delineators are presented below.

Figure 3-20 Photographs of Delineator

Delineators along the Project Road at km. 369+050 & at km. 342+360

3.8 Toll Plaza

As per the Concession Agreement, there is one toll plaza on the Project Road at km. 343+510. The details of the Toll Plaza are as follows.

Table 3-7 Details of Summary for Toll Plaza Items

Sr. No.	Particulars	Details		Remarks
		LHS	RHS	
1	Number of Tolling Lanes	8	8	
2	Weigh in Motion Facility (Number of Lanes)	8	8	
3	No. of ETC lanes	8	8	
4	No of Toll booths	15		
5	Canopy	Present		
6	Administrative building	Present		
7	Parking cum Toilet box	Present		
8	Availability of Tunnel or Elevated walkaway for movement between Toll lanes and administrative building	Tunnel/Yes		
9	Availability of static weigh bridge	Yes		2 numbers
10	Availability of Loading/Unloading Facility for Overloading vehicles	No		
11	Storage facility for Overloaded material	No		
12	High mast light	Yes		
13	Streetlight	Yes		
14	Low mast light	No		
15	User fee boards	Yes		
16	Cantilever/Gantry boards	Yes		
17	Automatic boom barrier	Yes

3.9 Bus Bays and Passenger Shelters

There are 38 Nos. of bus bays / passenger shelters along the Project Road.

Some of the photographs of the bus bays are presented below.

Figure 3-22 Photographs of Bus Bays / Passenger Shelter

Bus Bay at Basweshwar Nagar at km. 372+100 (RHS)

Bus Bay at km. 342+650 RHS

3.10 Truck Lay Bye

There is 01 Nos. of truck lay bye at km. 349+950 (LHS) constructed and km. 349+950 (RHS) is descope.

Some of the photographs of the truck lay bye are presented below.

Figure 3-23 Photographs of Truck Lay Bye

Truck lay bye at km. 349+950 (LHS)

Toilet Block at Truck lay bye at km. 349+950 (LHS)

3.11 Advanced Traffic Management System (ATMS)

Advanced Traffic Management System (ATMS) installed for the Project Road is controlled by the ATMS center at toll plaza location (km. 343+440). The ATMS is provided and being maintained as per the requirement of the Concession Agreement. The ATMS provided are listed below.

- Automatic Traffic Counter cum Classifier (ATCC)
- Emergency Call Box
- Variable Message Signs System (Fixed/Portable)
- Mobile communication System
- Mobile Radio Communication System
- Integrated ATMS Software and System Architecture
- ATMS Control Center integrated with above sub-components
- Weigh-in-motion (Portable)
- Vehicle actuated speed detection camera.

Status of these systems at site are described below.

3.11.1 Automatic Traffic Counter cum classifier (ATCC)

Automatic Traffic Counter cum Classifiers (ATCC) is installed at Toll Plaza (km. 343+440).

Figure 3-24 Photographs of ATCC

ATCC near Toll Plaza

ATCC at Toll Plaza

3.11.2 Emergency Call Boxes (ECB)

ECB is installed on the Project Road at the locations as per the requirement. Some of the photographs of the ECB are presented below.

Figure 3-25 Photographs of ECB

ECB at km. 371+500 (RHS)

ECB at km. 356+220 (RHS)

3.11.3 Variable Message Signs System

VMS is installed on the Project Road at the locations as per the requirement. Some of the photographs of the VMS are presented below.

Figure 3-26 Photographs of VMS

VMS at km. 371+000

VMS at km. 369+040 (RHS)

3.11.4 CCTV Surveillance Cameras

Surveillance cameras are installed as per CA requirement along the Project Road. The HTMS control room has video wall to monitor these locations through the cameras installed.

Figure 3-27 Photographs of CCTV Surveillance Camera

CCTV at km. 371+500 (LHS)

CCTV at km. 364+400 (Median)

3.12 Video Incident Detection System

CCTV cameras are installed as part of Video incident detection system.

3.13 Balance Work Status

The Concessionaire has received Completion Certificate for the length of 55.800 kms with effective from 01st March 2023. Hence, there is no balance work on Project Road.

3.14 Operation and Maintenances

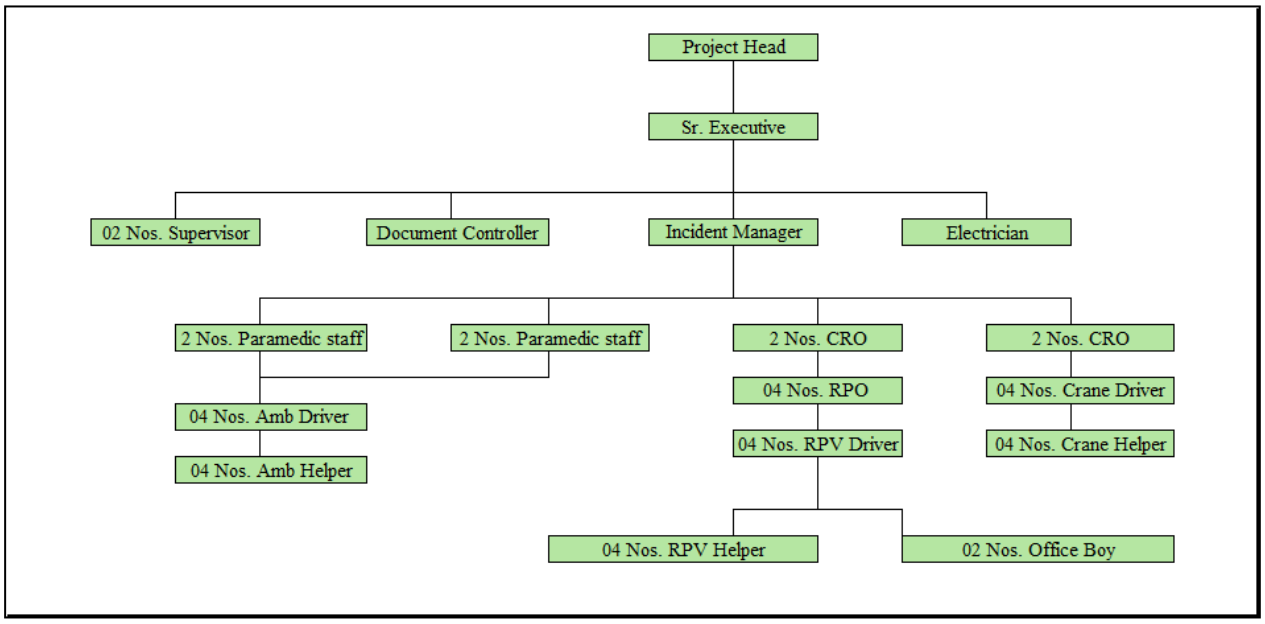
3.14.1 O&M Contract

As per Clause 17.1 of the Concession Agreement, the Concessionaire shall operate and maintain the Project Road by itself, or through O&M Contractors and if required, modify, repair, improve the Project Road to comply with Specifications and Standards, and other requirements set forth in the Agreement through Good Industry Practice, Applicable Laws and Applicable Permits and manufacturer's guidelines and instructions with respect to toll systems. The Operation and Maintenance activities shall conform to all the requirements laid down in MoRT&H, IRC Specifications and the Concession Agreement. The Concessionaire has outsourced for carrying out the activities related to operation and maintenance of the Project Road including security services, Incident management services.

3.14.2 Organization Chart

The Concessionaire has given the Organization Chart at site for Operation and maintenance. Accordingly, there is 01 Project Head, 01 Senior Executive- Maintenance, 02 Supervisor, 01 Electrician, 01 Incident Manager, 01 Document Controller to carry out O&M activities. The team controls the maintenance activities. However, the maintenance work is undertaken and executed through competent subcontractors.

Organization Charts



3.14.3 Operation

Operation cost is comprised of manpower cost, Security cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses and other miscellaneous expenses. The Concessionaire has provided the expenses occurred towards operation expenses for past years. Necessary assumptions have made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area.

The Operation Cost is presented in the subsequent chapter.

3.14.4 Routine Maintenance

The Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey.

Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Maintenance Cost is presented in the subsequent chapter.

4 PAVEMENT INVESTIGATION AND ASSESSMENT

4.1 General

Presently, the pavement of the Project Road is being maintained by the Concessionaire as per scope of work. The Concessionaire has received Completion Certificate on 01st March 2023 for the length of 55.800 out of the length project is 56.500 kms (55.80 kms length after descope).

The project is currently under the Operation and Maintenance stage. The concession period of the project is 17 years from the Appointed Date 23rd May 2019 including construction period of 2 years.

4.2 Surveys and Investigation

4.2.1 Pavement Condition Survey

Pavement condition survey was carried out by the Technical Consultant from **7th March 2026 to 8th March 2026** through visual inspection for the project road and for the entire length.

The summary of pavement condition based on the visual inspection is tabulated below.

Table 4-1 Summary of Pavement Condition

Sr. No.	Chainage (km)		Length (km)	Visual Condition (As per IRC:115-2014)	
	From	To		Left Carriageway	Right Carriageway
1	321+600	377+450	55.800	Good	Good

4.2.2 Observation and Conclusion

From the above table, it is observed that the overall pavement condition for the entire project stretch is found to be Good. The repair & rectification work, wherever required, is in progress on the Project Road.

4.2.3 Network Survey Vehicles (NSV) Survey

The Concessionaire has conducted pavement condition survey on each lane of each carriageway with NSV. The NSV survey was conducted on the Project Road from 15th December 2025 to 16th December 2025.

4.2.4 Roughness Survey

Roughness survey results were provided by the Concessionaire for analysis and to assess the riding quality on each direction (each lane) of the carriageway of Project Road.

The side-wise results of Roughness Survey are presented as below.

Table 4-2 Result of Roughness Survey as per CA

Table 1-3 Roughness summary for Rigid pavement as per Schedule

Roughness Summary as per Schedule: NH-166: MSHPL: (1km Data)									
S.no	Condition	BI (mm/km)	LHS				RHS			
			Inner Lane		Outer Lane		Inner Lane		Outer Lane	
			Length (km)	Length (%)	Length (km)	Length (%)	Length (km)	Length (%)	Length (km)	Length (%)
1	Limiting value	<=2750	53.800	96.42	53.600	96.40	53.500	96.40	45.100	82.15
2		>2750	2.000	3.58	2.000	3.60	2.000	3.60	9.800	17.85
Total Surveyed length (km)			55.800	100.00	55.600	100.00	55.500	100.00	55.500	100.00

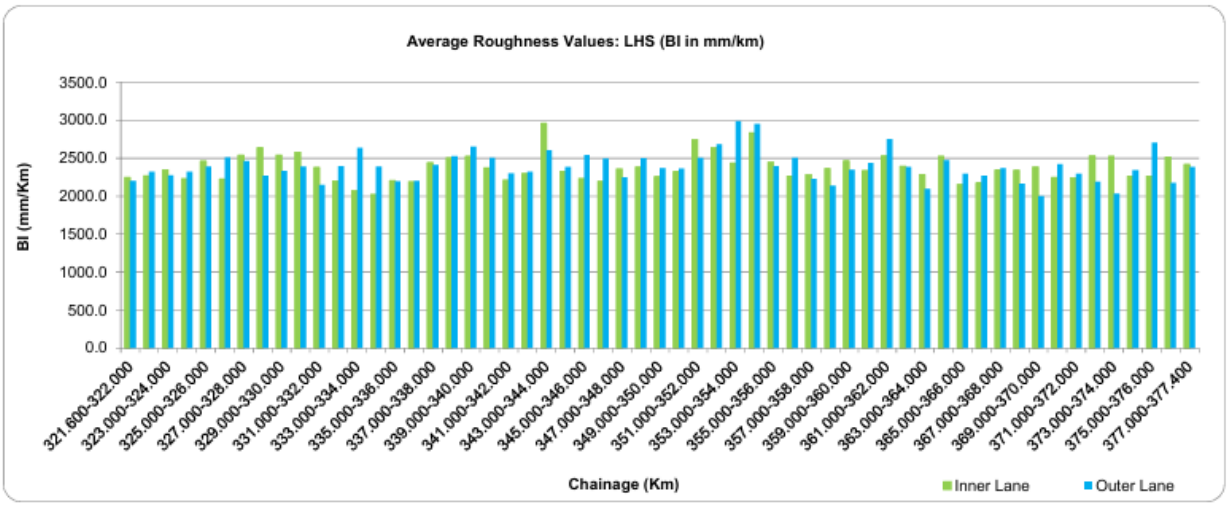


Figure 1-1 Illustrative summary of Roughness on LHS direction

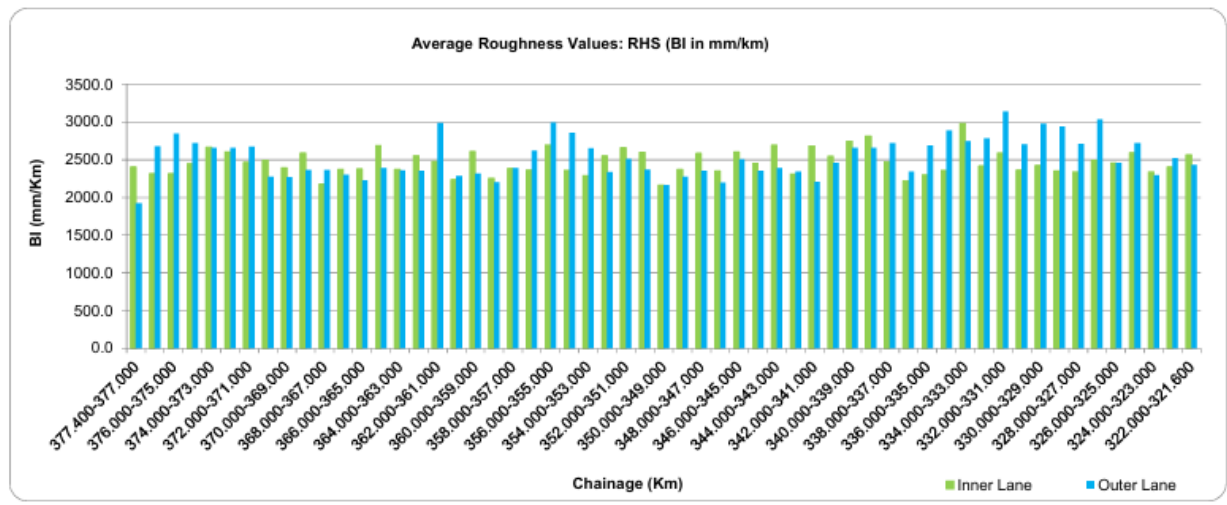

Figure 1-2 Illustrative summary of Roughness on RHS direction

Observation and Conclusion:

As per the Concession Agreement (CA), the specified roughness value for the project is 2750 mm/km. Based on this criterion, the overall pavement condition of the entire project stretch is assessed to be in Good to Fair condition, except for a stretch of 4.00 km.

The increase in roughness values at several locations is primarily attributed to the presence of rumble strips and ongoing maintenance activities at the site. The

Concessionaire has already initiated the PQC panel replacement work at these locations. The cost associated with the PQC panel replacement is being accounted under routine maintenance.

4.2.5 Periodic Maintenance Strategy

As per Schedule-K of Concession Agreement, the riding quality of the pavement shall be ensured by satisfying the minimum requirements given herein under:

1. Surface roughness of the Project Road on completion of construction shall not exceed 2750 mm/km as measured by a standard rough meter / bump integrator.

   The table below shows the major / periodic maintenance cycle throughout the concession period for the Project Road.

Table 4-3 Major Maintenance Cycle

Sr. No.	Year	Main Carriageway	Service Road
1	FY 2023 to FY 2028	-	-
2	FY 2029	Major maintenance with Re-texturing and Grinding with 40% + Replacement of PQC Panel 2%	Major maintenance with Re-texturing and Grinding with 25% + Replacement of PQC Panel 1%
3	FY 2030 to FY 2035	-	-
4	FY 2036	Major maintenance with Re-texturing and Grinding with 60% + Replacement of PQC Panel 2%	Major maintenance with Re-texturing and Grinding with 25% + Replacement of PQC Panel 1%
5	FY 2037	-	-

The projected cost for periodic / major maintenance is presented in the subsequent chapter.

5 COST ESTIMATES

5.1 General

Based on the assessment carried out in previous chapters, various costs were worked out. The costs are divided into following categories.

I. Balance Work Cost
II. Routine O&M Cost
III. Major Maintenance Cost
IV. Periodic Replacement of TMS / ATMS system

Costs for different category are detailed out in subsequent sections along with the assumptions considered for rate and escalation.

5.2 Rate Assumption

Following assumptions are considered for unit rates of various items while estimating the cost:

Unit rates of different items (Concrete, PQC, DLC etc.) are calculated as per Govt. of Maharashtra P.W.D. SSR 2022-23. The input rates for SSR were adopted as below.

a. **Manpower and Labour:** As per applicable minimum wages published by State Schedule of Rates, Government of Maharashtra.

b. **Sand and Aggregate:** Market rates are considered from the quarry located nearest to the Project Road.

c. Cement: Rate of Cement is taken from MH SSR 2022-23.

d. Steel : Rate of steel is taken from MH SSR 2022-23.

e. **Machinery Hire charges:** Hire charges for the machinery are considered in accordance with applicable MH SSR 2022-23.

f. **Rates of items as per Work Order:** The rates of Milling, Road marking, road Stud etc. are considered as per the Work Order issued to Contractor at Site shared by the client.

1. Goods and Service Tax (GST) is considered as 18% as per the latest Government Guidelines.

Summary of Unit Rates worked out using Standard Data Book adopted for major items is given below.

Table 5-1 Summary of Unit Rates

Sr. No.	Item Description	Unit	Rates (Rs.)
1	Pavement Quality Concrete	Cum	7,381
2	Dry Lean Concrete	Cum	4,381
3	Retexturing and grinding	Sqm	120
4	Joint sealant	Sqm	86
5	Road Marking	Sqm	485
6	Road Studs	Nos.	193

5.3 Balance Work Cost (CAPEX)

As discussed in the previous chapter, there is no balance work in the Project Highway.

5.4 Routine O&M Cost

Routine O&M cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses, horticulture and ROW maintenance, routine maintenance and other miscellaneous expenses. The Concessionaire has provided the major agreements towards operation and maintenance for past years. Necessary assumptions have been made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area. Same has been divided into following major heads.

1. Salary and Welfare Expenses
2. Toll Security Services
3. Incident Management Services
4. Electricity
5. HTMS Expenses
6. Office Operating Expenses
7. Vehicle Running Expenses
8. Professional Fees Expense
9. Community Development
10. Communication Expenses
11. Conveyance Expenses
12. Insurance Expense
13. IE Fees
14. Horticulture & ROW Maintenance
15. Routine Maintenance Cost

In above, the Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey. Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Operation Cost is presented as below. The detailed working of routine maintenance (Sr. No. 15 of below table) is presented in **Annexure-I**.

Table 5-2 Summary of Operation Cost

Sr. No.	Particulars	Amount (FY 2027-36)
1	Salary and Welfare Expenses	74,10,600
2	Security Expenses	15,81,826
3	Incident Management & Emergency Services	2,03,07,859
4	Electricity Charges	2,78,92,216

Sr. No.	Particulars	Amount (FY 2027-36)
5	TMS / HTMS / System Expenses	1,13,09,361
6	Office Operating Expenses	35,73,625
7	Vehicle Running Expenses	25,53,000
8	Professional Fees Expense	1,62,43,750
9	Community Development	16,24,375
10	Communication Expenses	3,96,348
11	Conveyance Expenses	4,22,338
12	Insurance Expense	92,00,460
13	IE Fees	1,36,73,000
14	Routine Maintenance Cost (Project Road)	2,20,27,461
15	Horticulture & ROW Maintenance	1,81,72,944
16	Miscellaneous including Contingency	46,47,550
	Total Cost (Rs.)	**16,10,36,712**
	Total Cost (Cr.)	**16.10**
	Per km Cost (in Lakhs)	28.50

5.5 Major Maintenance Cost

The summary of Major Maintenance Cost is provided as below. The detailed working of the same is presented in **Annexure-II**.

Sr. No.	Year	Major Maintenance Cost (Cr.)	Remarks
1	FY 2023 to FY 2028	-	
2	FY 2029	27.83	
3	FY 2030 to FY 2035	-	
4	FY 2036	32.68	
5	FY 2037	-	
Total Cost (Cr.)		**60.52**	

5.6 Periodic Replacement of TMS / ATMS System

Every 7 years, replacement cost of major TMS / ATMS system is considered. The same is provided as below.

Sr. No.	Year	HTMS O&M / Replacement Cost (Cr.)	Remarks
1	FY 2029	4.51	
2	FY 2036	4.51	
Total Cost (Cr.)		**9.02**	

5.7 Escalation Assumptions

The following escalation is considered basis discussions with Client and our internal estimates.

Table 5-3 Escalation

Year	Escalation	Year	Escalation
2028	4.86%	**2041**	3.99%
2029	4.44%	**2042**	3.99%
2030	4.24%	**2043**	3.99%
2031	4.13%	**2044**	3.99%
2032	4.08%	**2045**	3.99%
2033	4.01%	**2046**	3.99%
2034	4.00%	**2047**	3.99%
2035	4.03%	**2048**	3.99%
2036	4.01%	**2049**	3.99%
2037	3.98%	**2050**	3.99%
2038	3.98%	**2051**	3.99%
2039	4.00%	**2052**	3.99%
2040	3.99%	**2053**	3.99%

5.8 Summary of Cost

Different O&M cost have been worked out based on the investigations and assessment on Project Road. Cost for each of the category has already discussed in previous sections. Since the forecasting has been carried out for remaining concession period, the cost is summarised yearly for remaining concession period along with escalation as mentioned in Clause 5.7.

Escalated O&M Cost (in INR Cr.)

	Year of expense	FY 27	FY 28	FY 29	FY 30	FY 31	FY 32	FY 33	FY 34	FY 35	FY 36	FY 37
1	Routine O&M Cost											
1.01	Salary and Welfare Expense	0.74	0.78	0.81	0.85	0.88	0.92	0.96	1.00	1.04	1.08	1.12
1.02	Security Expenses	0.16	0.17	0.17	0.18	0.19	0.20	0.20	0.21	0.22	0.23	0.24
1.03	Incident Management Services	2.03	2.13	2.23	2.33	2.42	2.52	2.62	2.73	2.84	2.95	3.07
1.04	Electricity and Diesel Charges	2.79	2.93	3.06	3.19	3.33	3.46	3.60	3.75	3.90	4.05	4.21

		Paved shoulder	2.20	357857.00	435414.00	-	0.64	-	2,78,665
3	Six lane with divided carriageway and service lane on either side	without Paved shoulder	2.90	471721.00	573955.00	-	-	-	-
		with Paved shoulder	3.10	504253.00	613538.00	-	15.20	-	93,28,109
TOTAL						**55.800**		**2,06,55,702**	

Ordinary Repairs

Details of Ordinary Repair in Rs. for one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity**
				More than 4500 CVD
				CC Surface
1	**2**	**3**	**4**	**5**
1	**Maintenance of Carriageway & Paved Shoulders (1.5m wide); B.T. Surface**			
	i) Pot holes repair (50 mm deep)	100 % Pot hole free	As & when required	0.00%
	Volume (cum)			0.00
	Rs/m^3			15635
	Cost in Rupees			0
	ii) Patch repair	100 % Patch less	As & when required	0.00%
	Area (sqm)			10
	Rs/m^2			625
	Cost in Rupees			6,254
	iii) Sealing (Crack)			
	a) Wider than 3 mm	100 % Crack Less	As & when required	2.50%
	Area (sqm)			250
	Rs/m^2			107
	Cost in Rupees			26,845
	b) Width less than 3 mm	75 % Crack Less	As & when required	1.50%
	Area (sqm)			112.5
	Rs/m^2			81
	Cost in Rupees			9,160
	iv) Repair of ruts and undulations			
	a) Greater than 20 mm	75%	As & when required	0.00%
	Area (sqm)			10
	Rs/m^2			625
	Cost in Rupees			6,254
	v) Road marking	10%		13737

Details of Ordinary Repair in Rs. for one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)

				More than 4500 CVD
				CC Surface
1	**2**	**3**	**4**	**5**
	vi) Joint Sealant Repair/Replacement	7%		21609
	SUB TOTAL			**83,859**
2	**Maintenance of earthen Shoulders:**			
	i) Renewal of earthen shoulders	80%	Once in a Year	6306
	ii) Jungle Clearance	100%	Twice in a Year	2069
	iii) Kuccha Drain Maintenance	100%	Twice in a Year	1108
	SUB TOTAL			**9,483**
3	**Maintenance of Cross Drainage works:**			
	i) Cleaning of culvert bed	100%	Once in a Year	2793
	ii) Repair of floors	100%	Once in a Year	5055
	iii) Repair of parapets	100%	As & when required	2106
	SUB TOTAL			**9,954**
4	**Maintenance of Minor & Major Bridges:**			
	i) Cleaning and removal of dirt & vegetation from pier caps, Bearings, Expansion Joints, Superstructure, Substructure and Retaining wall etc.	100%	As & when required	36,950
	ii) Spot painting & protective Coating required on Bearing and greasing of Bearings, railing, structural members, Expansion joints			
	iii) Repair of minor washouts, erosion scour and animal holes			
	iv) Sealing Cracks with Cement/ Epoxy Mortar			
	v) Replacement & Correction of safety barriers, Guard rails and damaged members			
	SUB TOTAL			**36,950**
5	**Miscellaneous Items:**			
	i) Turfing and Arboriculture		Once in a Year	4926
	ii) Maintenance of gang hut store, sheds, animal & debris		Once in a Year	3695

Details of Ordinary Repair in Rs. for one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)

1 INTRODUCTION

1.1 Background

Cube Highways Fund Advisors Pvt. Ltd. (hereinafter referred as "the Client") is the Investment Manager of the Cube Highways Trust ("Trust" or "InvIT"). The Trust is registered with Securities and Exchange Board of India ("SEBI") as an infrastructure investment trust under the SEBI InVIT Regulations. Cube Highways Fund Advisors Pvt. Ltd. has appointed M/s. **FP Project Management Consultancy Services Private Limited** (hereinafter referred as "Technical Consultant" or "FPPM") to carry out Technical Due Diligence of Narketpally - Addanki - Medarametla (NAMEL) section of SH-2 from km. 0+000 to km. 212+500 in the State of Andhra Pradesh and Telangana under Public Private Partnership on DBFOT (Toll) basis (hereinafter referred as "Project Road").

N.A.M. Expressway Limited Hyderabad, (hereinafter referred as "Concessionaire") is a special purpose vehicle (SPV) for tolling, operation, maintenance, and transfer of Narketpally - Addanki - Medarametla (NAMEL) section of SH-2 from km. 0.000 to km. 212.500 or Project Road under DBFOT mode. The project was awarded to Concessionaire on 23rd July 2010 with a concession period of 24 years (from Appointed Date including 30 months construction period) by National Highway Authority of India (NHAI). The length of Project Road is 212.860 kms with three Nos. of toll plaza at km. 41+200, km. 110+000 and km. 168+000.

Accordingly, the Technical Consultant has undertaken the work of assessment of operation and maintenance (O&M) cost based on site inspections and field investigations. The same is presented in this report.

1.2 Scope of Work

The detailed scope of work for conducting technical due diligence of Project Road is presented below.

- A reconnaissance of the Project Road to understand the current condition of the pavement, structures, road furniture, toll plaza and other highway assets
- Review and assessment of important technical documents like CA, pavement design report, O&M report, DPR, As-built drawings, O&M manual, COD / PCOD certificate, Punch list, previous major maintenance etc.
- Review of recent pavement investigations and surveys conducted on Project Road like FWD, NSV, Axle Load, material investigations etc.
- Formulation of future major maintenance strategy
- Estimation of any initial expenses to be incurred due to deficiencies observed in diligence
- Estimation of Annual Routine Maintenance and Major Maintenance forecast for all projects till the end of concession period (considering the traffic projections presented in the traffic study reports).
- Estimation of Annual Operation expenses along with Systems cost (TMS / HTMS) till the end of concession period.
- Review of balance work cost for Project Road including estimation of quantities and item rates.

1.3 Our Approach Philosophy

1.3.1 Composition of Team

Our proposed team consists of well-qualified Engineers and other professionals, whose experience covers all the skills and specializations required for undertaking such assignments. All the team personnel proposed are our regular employees and have a long and stable working relationship with our firm.

The Team Leader coordinates the activities between all the key staff who work closely together. The key staff is assisted by various support staff, who report to the respective key staff in their field of expertise. The Team Leader is the point of contact for Client Technical Study.

The technical study shall include review of all the available documents namely:

a) Concession Agreement including Technical Schedules
b) O&M Contract, work order and their provisions
c) Quality of construction based on available data, design and drawings
d) Documents on historical expenditure on operation and maintenance
e) O&M cost schedule for the concession period
f) Review of Completion / Provisional Completion along with punch list items
g) Review of recent pavement survey conducted
h) Correspondence regarding scope of works and during O&M
i) Recent O&M Report submitted to Authority
j) Toll operation manual / ATMS related documents

The review of above documents is the first step towards accomplishment of the task. This gives a complete idea of the project as per the contract and is used as input data for preparation of report after necessary analysis.

1.3.2 Site Visit and Data Collection

A team of experts from various streams are expected to carry out the preliminary site visit to understand the assessment of project assets mainly condition of the pavement and structures.

- The site visit is undertaken for detailed reconnaissance and visual pavement condition assessment.
- The condition assessment of major structures by visual inspection.
- The information like material sources and the probable cost is collected for the purpose of cost estimates.

The detailed design / drawings viz. Plan & L-sections, drainage design, structure design, layout drawings for project facilities like toll plaza, bus bay, truck lay-byes, highway lighting facilities etc. are studied. Also, design / drawing and provision pertaining to road furniture are studied.

The information on availability of material in the vicinity are gathered. It has direct impact on cost of maintenance work and balance work.

The basic approach for preparation of cost estimates for operation and maintenance is as per the practice of State PWD / MORT&H in respect of highways and structures.

1.3.3 Data Analysis

Based on the study of the available information and preliminary site visits, the Consultants share their preliminary observations with the Client based on the evaluation of the technical data and reports provided by the Client.

1.4 Structure of the Report

This report has been prepared based on the information, reports and documents made available to us by the Company. We have also referred to publicly available reports, literature etc. and have made our best efforts to check the authenticity of the information available, analyse the same as per the best engineering / industry practices.

The site visit and inspection for the reconnaissance, road inventory and condition survey were carried from **16th March 2026** to **19th March 2026**.

The report is organized with the following chapters for easy understanding of various issues.

Chapter 1 **Introduction:** The chapter gives an overview of the project background, detailed scope of work, approach, and methodology for due diligence studies**.**

Chapter 2 **Project Description:** The chapter describes existing project features, and overview of project development.

Chapter 3 **Condition Assessment of Project Road:** The chapter presents the details and condition of various essential features of the Project Road based on site visit**.**

Chapter 4 **Pavement Investigation and Assessment:** This chapter describes the summary of pavement surveys and investigations carried out on Project Road along with the requirement of pavement maintenance

Chapter 5 **Cost Estimates**: This chapter summarizes the forecast for O&M and major maintenance costs over the remaining concession period

2 PROJECT DESCRIPTION

2.1 Introduction

National Highways Authority of India had signed the Concession Agreement with **N.A.M. Expressway Limited**, is a company promoted by Cube Highways or company a Special Purpose Vehicle (SPV) formed for implementing this Project on 23rd July 2010. The Appointed Date for the Project Road is 18th January 2011. The Supplementary Agreement was also executed on 27th January 2016.

The Project Road is being developed through PPP mode on DBFOT (Design, Built, Finance, Operate and Transfer) with concession period of 24 years from the Appointed Date.

2.2 Location of the Project Road

The Project Road is a State Highway No. 2 of Narketpally - Addanki - Medarametla section in the state of Andhra Pradesh and Telangana. The total length of Project Road is 212.860 kms.

The Location Map of the Project Road is presented below:

Figure 2-1 Location Map

The Photographs taken during the site visit are presented as below.

Figure 2-2 Start of the Project Road

Figure 2-3 End of the Project Road

2.3 Climate

Summer temperature of project area reaches as high as 44 °C (111 °F) (March - May) has the highest temperatures but these are usually followed by monsoon rains and the annual average rainfall 794.5 mm receiving both northeast and southwest monsoons. The winter season (from November / to February) is the most enjoyable with a pleasant climate. Winter months are usually dry, with little to no rainfall. The average annual temperature is 24.5 °C. Cyclones may occur at any time of the year, but occur more commonly in the period from October to December.

2.4 Terrain

This section of State Highway traverses through plain / rolling terrain.

2.5 Abutting Land Use

The land used along Project Road is predominantly agriculture with intermittent built-up settlements.

2.6 Right of Way

The width of the existing Right of Way (Row) for the Project Road varies from 30.0 m to 35.0 m.

2.7 Existing Utilities

During widening of the Project Road, various affected utility services located along the Project Road were shifted to the PROW. The different types of utilities found along the road include, electrical poles, telephone poles, OFC Cables, etc.

2.8 Development as per Schedule-B

The Project Road from Narketpally (km. 0+000) to Medarametla (km. 212+500) has been developed as a four-lane divided carriageway with other facilities such as service road, toll plaza, truck lay-bye, bus bays and other arrangements. The Project Road passes through rural as well as built up sections.

As per Article 2 of Concession Agreement, the scope of project defined in Schedule-A and Schedule-B, (the **"Scope of the Project"**) shall mean and include, during the Concession Period:

a) Tolling, operation, management, maintenance, and transfer of the Project Road subject to and in accordance with the provisions of this Agreement; and

b) performance and fulfilment of all other obligations of the Concessionaire in accordance with the provisions of this Agreement and matters incidental thereto or necessary for the performance of any or all of the obligations of the Concessionaire under this Agreement.

Following is the Scope of Work as per Schedule B of the Concession Agreement.

Sr. No.	Description	Unit	Scope	Remarks
1	Construction of Main Carriageway	km	212.860	
2	Construction of Service Road	km	25.5	
3	Construction of Major Bridges	Nos.	7	
4	Construction of ROB	Nos.	2	
5	Construction of Minor Bridges	Nos.	46	
6	Improvement of Major Junction	Nos.	5	
7	Improvement of Minor Junction	Nos.	34	

3 CONDITION ASSESSMENT OF PROJECT ROAD

3.1 Pavement

The Project Road is four lane divided carriageway and generally has paved carriageway of 8.75 m with an earthen shoulder of 1.0 m to 1.5 m on either side. The Project Road has a median width of 1.5 m to 4.5 m throughout its length. The entire stretch of Project Road including service road is constructed with flexible pavement. The pavement type for the toll plaza including taper is of rigid pavement.

3.2 Pavement Condition Survey

The pavement condition survey was carried out from **16th March 2026 to 19th March 2026** through visual inspection for the entire project length. From the visual inspection, the pavement condition of the entire project road is found to be Good to fair. During the site visit, some cracks and rutting were observed at few locations. The Concessionaire is carrying out major maintenance and routine maintenance for Project Road which is witnessed during the site visit.

The photographs taken during the site visit are presented below.

Figure 3-1 Photographs of Pavement Condition (Main Carriageway)

Pavement Condition at km. 2+150 (RHS)

Pavement Condition at km. 16+630 (LHS)

Pavement Condition at km. 50+990 (RHS)

Pavement Condition at km. 96+800 (LHS)

Pavement Condition at km. 123+600 (LHS)

Pavement Condition at km. 129+300 (LHS)

Pavement Condition at km. 154+510 (RHS)

3.3 Service Road / Slip Road

The service road / slip road of width 3.75 / 5.50 m is constructed at built-up locations and at adjoining underpass locations. The service road / slip road is provided for total length of 25.50 kms as per Concession Agreement.

The photographs taken during the site visit are presented below.

Figure 3-2 Photographs of Service Road / Slip Road

Pavement Condition at km. 100+120 (RHS)

Pavement Condition at km. 61+000 (RHS)

Pavement Condition at km. 74+100 (RHS)

Pavement Condition at km. 77+700 (LHS)

Pavement Condition at km. 100+120 (RHS)

Pavement Condition at km. 137+000 km (LHS)

3.4 Major / Minor Intersection

There are 05 nos. of major junctions and 35 nos. of minor junctions along Project Road. The photographs taken during the site visit are presented below.

Figure 3-3 Photographs of Major Junctions

Major Junction at km. 34+875

Major Junction at km. 0+900

3.5 Condition Survey of Bridge

The inventory of structures including major bridges, minor bridges, underpass and culverts is presented in table below:

Table 3-1 Details of Summary for Structures

Sr. No.	Particulars	Unit	Total Number of Structures as per site
1	Road Over Bridge (ROB)	Nos.	02
72	Road Under Bridge (RUB)	Nos.	02 (Not in the scope of Concessionaire)
3	Flyover	Nos.	02 (Not in the scope of Concessionaire)
4	Major Bridge	Nos.	05
5	Minor Bridge	Nos.	53
6	Vehicular Underpass (PUP)	Nos.	10
7	Light Vehicular Underpass	Nos.	-
8	Slab Culverts	Nos.	58
9	Box Culverts	Nos.	49
10	Hume Pipe Culverts	Nos.	323

All major structures and CD works were visually inspected. The structures are generally sufficient for storm water drainage. The waterway needs regular cleaning. All the old bridges are 2-lane and widened to 2 additional lanes. Generally, the structures have open foundation. At few bridges, approach settlement and pavement cracks were observed. New bridges are constructed with 2-lane with footpath keeping a provision of converting into 3-lane configuration in future. The wearing course and expansion joints are found satisfactory. The crash barriers are of RCC type and are in sound condition. The return walls are of RCC type and pitching has been provided in all bridges.

The detailed condition survey of structures was carried out by visual inspection. The observations and findings are presented in table below:

Table 3-2 Details of New Minor Bridges

Sr. No.	Type of Structure	Chainage (km)	Size	Length of Structure (m)	Type of Construction	FPPM Comments
1	Minor Bridge	05+955	6 x 2.10	12.60	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
2	Minor Bridge	06+029	12 x 2.12	25.44	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
3	Minor Bridge	09+275	2 x 6.40	12.80	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
4	Minor Bridge	11+592	2 x 7.40	14.80	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
5	Minor Bridge	16+721	3 x 7.85	23.55	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
6	Minor Bridge	16+978	3 x 3.50	10.50	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
7	Minor Bridge	17+372	2 x 7.85	15.70	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
8	Minor Bridge	30+844	2 x 4.40	8.80	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
9	Minor Bridge	34+345	3 x 6.35	19.05	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
10	Minor Bridge	35+210	3 x 7.00	21.00	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
11	Minor Bridge	41+710		13.50	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
12	Minor Bridge	48+231	3 x 4.40	13.20	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
13	Minor Bridge	50+919	5 x 8.75 + 2 x 9.70	63.15	Concentric widening	Overall structure, pavement, railing is in good condition on LHS new structure & RHS is Old Structure.
14	Minor Bridge	56+325	2 x 5.40	10.80	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
15	Minor Bridge	58+774	4 x 3.50	14.00	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
16	Minor Bridge	67+331	5 x 7.75	38.75	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
17	Minor Bridge	68+206	3 x 9.40	28.20	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
18	Minor Bridge	70+290	3 x 7.30	21.90	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
19	Minor Bridge	73+474	10 x 3.50	35.00	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
20	Minor Bridge	77+924	3 x 3.80	11.40	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
21	Minor Bridge	82+752	3 x 7.35	22.05	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
22	Minor Bridge	89+524	3 x 3.00	9.00	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
23	Minor Bridge	93+359	8 x 3.00	24.00	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
24	Minor Bridge	96+370	4 x 3.80	15.20	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
25	Minor Bridge	97+047	3 x 3.00	9.00	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
26	Minor Bridge	98+164	4 x 3.80	15.20	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
27	Minor Bridge	99+610	7 x 5.30	37.10	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
28	Minor Bridge	106+290	3 x 4.20	12.60	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
29	Minor Bridge	108+517	5 x 8.76	43.80	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
30	Minor Bridge	111+815	3 x 4.00	12.00	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
31	Minor Bridge	114+370	1 x 10.00	10.00	New Construction	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
32	Minor Bridge	117+800	1 x 7.90	7.90	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
33	Minor Bridge	121+950	ACOD (Bypass)	7.00	New Construction	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
34	Minor Bridge	123+245	ACOD (Bypass)	40.00	New Construction	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
35	Minor Bridge	123+630	ACOD (Bypass)	40.00	New Construction	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
36	Minor Bridge	124+284	ACOD (Bypass)	40.00	New Construction	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
37	Minor Bridge	124+760	ACOD (Bypass)	40.00	New Construction	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
38	Minor Bridge	129+345	2 x 6.70	13.40	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
39	Minor Bridge	129+418	4 x 6.70	26.80	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
40	Minor Bridge	135+156	2 x 8.00	16.00	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
41	Minor Bridge	141+745	6 x 8.85	53.10	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
42	Minor Bridge	141+805	5 x 6.50	32.50	Concentric widening	Overall structure, pavement, railing is in good condition on RHS. Old structure on LHS needs to be maintained
43	Minor Bridge	146+672	7 x 5.00	35.00	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
44	Minor Bridge	146+834	3 x 3.80	11.40	Concentric widening	Overall structure, pavement, railing is in good condition on both sides.
45	Minor Bridge	152+004	3 x 7.35	22.05	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.
46	Minor Bridge	154+490	5 x 9.758	48.79	Concentric widening	Overall structure, pavement, railing is in good condition on both sides. Waterway cleaning is required.

Major Bridge (length > 60 m)

There are 06 Nos. of major bridges on Project Road. All major bridges are visually inspected. The structures are generally sufficient for the crossing of river water. The waterway needs regular cleaning. Old structures are present on the right side of Project Road. The old bridges have 2-lane configurations and have RCC railing. The sub-structures are constructed with RCC piers. The expansion joints of the bridges need to be cleaned. New bridges are constructed with 2-lane + footpath. Old bridges on RHS have RCC pier and T-beam girders. The wearing course and expansion joints were found to be in good condition. W-beam and RCC type crash barriers are in sound condition. Drainage spouts need to be cleaned on a regular basis. Further, vegetation and silt need to be removed from the waterway for smooth flow of water.

Table 3-3 Details of Major Bridges

Sr. No.	Existing Chainage (km)	Design Chainage (km)	Type of Bridge	Existing Structure Span Details (m)	Type of Widening	Length of the Bridge (m)	FPPM Comments
1	29+989	29+972	RCC Slab	12x9.75	Eccentric	120.00	The structure is in good condition. Old structure is present on LHS and New structure is on RHS. Expansion joints condition is good. Railing is in good condition. Waterway needs to be cleaned.
2	53+497	52+435	RCC Solid Slab	6x10.90	Eccentric	66.00	New Structure is on LHS side, while old structure is in RHS side. Overall structure is in good condition on both sides. Vegetation is seen in the waterway, which needs to be cleaned for proper water flow. Pavement, expansion joint, railing is in good condition.
3	87+400	87+290	RCC Deck with Girders	13x35.40	Eccentric	500.00	New Structure is present on LHS and old structure is on RHS. Both the structures are in sound condition. Footpath with railing is provided on LHS. Expansion joint condition is good. Pavement condition is good on LHS and needs to be repaired on RHS. Expansion Joint Replacement work is in progress on old structure.
4	101+000	100+895	RCC Solid Slab	16x12.50	Eccentric	200.00	Overall structural condition is found good. Pavement, Expansion Joints, footpath and railing is in good condition. Cleaning is necessary for the flow of water.
5	196+600	197+560	RCC Solid Slab	22x8.90	Eccentric	200.00	New Structure is on RHS and Old structure is on LHS. Overall structural condition is good. Expansion joints, Pavement, railing and footpath on RHS is in good condition.
6	206+400	207+260	RCC Deck with Girders	4x18.30	Eccentric	74.00	New structure on LHS is in good condition. Footpath, railing, expansion joint and pavement is in very good condition. Old structure on RHS is in good condition.. Waterway cleaning is required for the smooth flow of water.

The photographs taken during the site visit are presented below.

3.6 Condition Survey of Culvert

The cross-drainage structure includes hume pipe culverts, box culverts and slab culverts at various locations. There are 323 Nos. of pipe culverts, 58 Nos. of slab culverts and 49 Nos. of box culverts along the Project Road. The height of the culvert varies from 1.0 m to 3.0 m from bed level. During the condition survey of structure, these culverts were inspected on a sample basis.

The Project Road involves strengthening and widening of existing road to four lane divided carriageway. The culverts beneath the existing alignment are either widened or reconstructed. The structural condition of culverts is generally found in sound condition. The quality of surface concrete of box culverts and slab culverts is found satisfactory. The RCC railing has been provided at culvert locations which is maintained properly.

At some culverts, the waterway needs to be cleaned. It is observed that waterways are blocked due to debris near urban areas. It is also found that bushes and tree growth are observed which must be removed and cleaned before monsoon. The wing wall has been provided for slope protection.

The culverts are maintained by the Concessionaire during the O&M period. However, damaged wing walls were observed at few culverts, which need to be addressed under routine repair work.

The photographs taken during the site visit are presented below.

Figure 3-9 Photographs of Box Culverts / Hume Pipe Culverts

3.7 Drainage

The drains are to be constructed on the Project Road to have good drainage for surface water. Covered lined drains are provided along the service / slip roads. Median cut drains are provided at superelevation locations. Chute drains are also constructed at high embankment portion of the Project Road. The drainage condition of Project Road is found to be satisfactory. Silt deposits need to be removed during routine maintenance. Earther drains are also provided in rural areas. The condition of the same is good to fair.

The photographs taken during site visit is presented as below:

Figure 3-10 Photographs of Drainage

RCC Drain at km. 4+820 (LHS)

RCC Covered Drain at km. 11+610 (LHS)

RCC Open Drain at km. 38+000 LHS

Median RCC Open Drain at km. 118+200

3.8 Slope Protection

Slope protection for high embankment areas has been done by providing revetment, chute drain and pitching at some locations. The same has been found as per the standards of O&M contracts.

The photographs taken during the site visit are presented below.

Figure 3-11 Photographs of Slope Protection

Slope Protection at km. 18+250

Slope Protection at km. 121+930 LHS

3.9 Road Furniture

Pavement Marking

Pavement marking for the Project Road is done as per the design standards indicated in section 12 of Schedule-D. Pavement marking is faded at some locations which needs rectification.

The photographs taken during the site visit are presented below.

Figure 3-12 Photographs of Pavement Marking

km. 34+625 LHS

km. 113+650 LHS

km. 120+950 Median

km. 157+500 (LHS)

Road Studs

The Concessionaire has provided road studs on the curves, road junctions, pedestrian crossings, municipal area, village settlements and ramps to provide the proper visibility to the road users. These are provided as per standards. The Concessionaire has replaced all the road studs on the Project Road.

The photographs taken during the site visit are presented below.

Figure 3-13 Photographs of Road Studs

km. 53+460

km. 77+927.

Traffic signage / Median kerb painting / KM Stone

Traffic signs includes roadside signs, overhead signs, kerb mounted signs and median signs along the Project Road. The design for the traffic signs along the Project Road is done as per the design standards indicated in section 11 of Schedule-D.

The height, lateral clearance, location and installation are as per relevant clauses of Schedule 'D'. Overhead sign has been installed ahead of major intersections, toll plazas, start / end of Project Road and urban areas as per detailed design requirements.

Painting at median kerb is found faded at few locations which needs to be rectified by the Concessionaire.

The photographs taken during the site visit are presented below.

Figure 3-14 Photographs of Traffic Signages

Speed limit Sign board at km. 9+220

Name board with direction at km. 0+850 LHS

Highway Lighting

Highway Lighting is provided at urban and semi-urban areas of the Project Road. Lighting is provided at the locations of truck lay-bye, bus bay, toll plazas, underpasses, service road and at intersections. IS:1944 (Part-I and Part-II) is followed for installation of lighting. High mast lighting systems are provided at toll plaza locations.

The photographs taken during the site visit are presented below.

Highway Lighting at Service road km. 18+250

Highway Lighting at km. 74+450

Highway Lighting at km. 100+895

High mast Lighting at TP km. 110+000

Crash Barriers

Metal beam crash barriers are provided at bridge approaches, locations of high embankment and sharp curves. All the crash barriers provided by the Concessionaire are properly maintained at site.

The photographs taken during the site visit are presented below.

Figure 3-16 Photographs of Crash Barrier

Crash Barrier at km. 6+020 LHS

Crash Barrier at km. 113+850 LHS

Crash Barrier at km. 129+340 LHS

Crash Barrier at km. 154+500 LHS

Delineators

The traffic delineators are provided by Concessionaire for road users on the Project Road. The same are maintained by the Concessionaire.

The photographs taken during the site visit are presented below.

Figure 3-17 Photographs of Delineator

Delineator at km. 77+927

Delineator at km. 157+500 ROB Approach LHS

Pedestrian Guard Rail

The pedestrian guard rails are provided in the median between service road and main carriageway at built-up locations.

The photographs taken during the site visit are presented below.

Figure 3-18 Photographs of Pedestrian Guard Rail

Pedestrian Guard Rail at km. 12+400 (LHS)

Pedestrian Guard Rail at km. 137+000 (LHS)

3.10 Avenue Plantation and Median Plantation

Avenue plantations and median plantations are done along the project length as per IRC specification except at built-up locations. Median plantation needs regular maintenance. Avenue plantation work is in progress at required location as per CA.

The photographs taken during the site visit are presented below.

Figure 3-19 Photographs of Avenue Plantation and Median Plantation

3.11 Toll Plaza

The Concessionaire has constructed 03 nos. of Toll Plaza at km. 41+200, km. 110+000 and km. 168+000. The details of the Toll Plaza are tabulated below.

Table 3-6 Details of Summary for Toll Plaza Items

Sr. No.	Particulars	Details		Remarks
		LHS	RHS	
1	Number of Tolling Lanes	4	4	
2	Weigh-in-Motion Facility (Number of Lanes)	4	4	
3	No. of ETC lanes	4	4	
4	No of Toll booths	8		
5	Canopy	Present		
6	Administrative building	Temporary arrangement is made		
7	Parking cum toilet box	Present		
8	Availability of tunnel or elevated walkaway for	Tunnel / Yes		

Sr. No.	Particulars	Details		Remarks
		LHS	RHS	
	movement between toll lanes and administrative building			
9	Availability of static weigh bridge	No		Installation is pending
10	Availability of loading / unloading facility for overloading vehicles	No		
11	Storage facility for overloaded material	No		
12	High mast light	Yes		
13	Street light	Yes		
14	Low mast light	No		
15	User fee boards	Yes		
16	Cantilever / gantry boards	Yes		
17	Automatic boom barrier	Yes		

The photographs taken during the site visit are presented below.

3.12 Lane Equipment

Following are the lane hardware and equipment installed at toll plaza.

1. RFID ETC Transceiver
2. Lane Controller with Industrial PC

3. AVC Sensors
4. Automatic Lane Barrier (ALB)
5. Lane Traffic Light and user fare display
6. Incident Capture Camera
7. Overhead Lane Signals
8. Traffic Lights
9. Toll Booth Equipment

3.12.1 RFID ETC Transceiver

RFID ETC Transceiver reads tags installed on the windshield of vehicles and mounted on a pole at about 6 m height. Handheld RFID readers are provided (1 no. in each direction) in case a tag is not detected by the fixed reader.

RFID at Toll Plaza

3.12.2 Lane Controller with Industrial PC

Toll Lane Controller is located within the Electronic Enclosure placed inside each toll booth which is connected to the common server and are capable of independent storage of data.

Inside View of Toll Booth

3.12.3 Automatic Vehicle Classification (AVC) Sensors

The AVC equipment comprises of a pair of height sensor poles, axle sensors and inductive loops. The height detector has a high sensing resolution and detects height when object blocks the path. The presence of vehicle is detected by inductive loop. The loop sensors embedded on the pavement trigger the AVC height sensors located on parallel pillars.

3.12.4 Automatic Lane Barrier

Boom barriers installed on all lanes are in working condition and have a working time of 0.6 - 0.9 s. Automatic Lane Barrier is used to allow only authorized vehicles to pass through the lane. The barrier is activated only on generation of user fee receipt or other relevant vehicle processing activity. A torque motor powers the barrier for raising and lowering the boom. The motor can be blocked at any position without causing any damage. In the event of power failure, the boom is automatically raised. The boom weight is exactly balanced by built-in springs.

Automatic Lane Barrier at Toll Plaza

3.12.5 Lane Traffic Light (LTL) and User Fare Display (UFD)

Lane Traffic Light (LTL) is used to instruct vehicles to stop or pass through the lane. The LTL is RED when the toll collector is expecting the vehicle at the booth. After the transaction is done; the LTL turns Green to instruct the vehicle to pass through the lane. The User Fare Display is a part of electronic toll collection equipment located at the toll booth. It is a mini variable message sign (VMS) made of Light Emitting Diodes (LED). The user fare display is used to display the toll fare that is due and that must be paid by the motorist and the classification of vehicle selected by the collector.

Lane Traffic Light (LTL) at Toll Plaza -02 and User Fare Display (UFD)

3.12.6 Incident Capture Camera (AVC Camera)

The incident capture camera is installed on island of the booth to capture the image of the vehicle from the back side. The AVC triggers the Image capture system.

AVC Camera

3.12.7 License Plate Image Capture Camera (LPIC)

License Plate Image capture camera is installed on a 3m pole facing incoming vehicle to capture the image of the vehicle number plate.

3.12.8 Over Head Lane Signal (OHLS)

The **Overhead Lane Signal (OHLS)** for lane “Open” and “Close” sign consists of a pair of “GREEN” (arrow) and “RED” (cross) lights. The OHLS is located at the vehicle approaching side of the canopy to show the drivers whether the lane is open or closed.

Over Head Lane Signal at Toll Plaza

3.12.9 Toll Booth Equipment

Toll Booth Hardware / Equipment provided are:

- Toll Collector Display (Operator Monitor)
- Customized Industrial Keyboard
- Receipt Printer
- Intercom Slave unit
- Bar code reader
- Violation Light and alarm
- Manual Booth Control (MBC)
- Booth Camera

The operator monitor termed as Toll Collector Display (TCD) is located on the toll collector's desk. It is the system's interface to the toll collector, to display the status of transactions and status of the lane peripherals.

The keyboard on the toll terminal is a programmable keyboard for Registration of toll operations and is customized for different vehicle types and type of ticket.

Thermal printers are installed at the toll booths to print tickets. Intercom slave unit facilitates communication with the master unit located in the control room.
Violation system has an alarm switch which is triggered whenever there is a violation such as run-through happening on the lane. When there is an emergency, a foot switch pressed by the booth operator alerts the control room.

Booth Cameras are provided on the inside roof corner of the booth to provide surveillance through CCTV screen located in the control room. Manual Booth Controller is used to release exempt vehicles.

3.12.10 Weigh in Motion (MSWIM)

Weigh in Motion (WIM) is installed on entry lanes of Toll Plaza.

MSWIM at Toll Plaza

3.13 Plaza Equipment

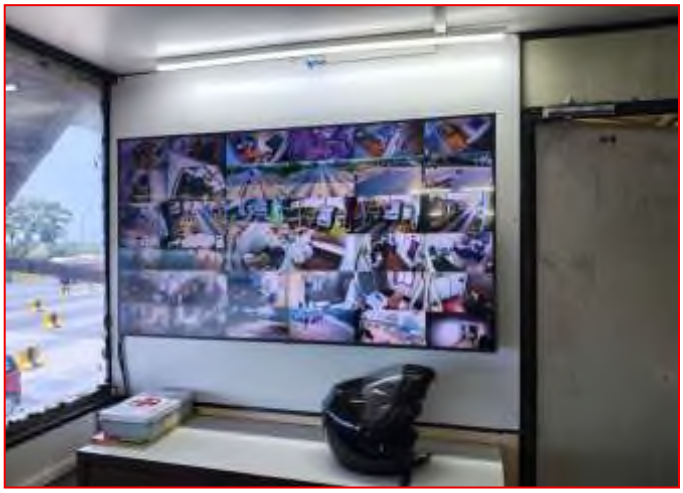
3.13.1 TMS Server

Plaza Server is provided in a hot standby configuration and provided with port non-POE network switch and Port PoE switch. Internet connectivity is available through one lease line (Airtel) and Jio Wi-Fi module. Firewall with Sophos antivirus is provided.

TMS server at Toll Plaza

3.13.2 55” LED screen for CCTV monitoring

55” LED screen for CCTV monitoring installed at the toll plaza admin block provides view of all the toll booths, important zones within the plaza where cash transactions take place (server room, control room, cash up).



LED screen at Toll Plaza

The toll plaza manager can observe the activities at the toll lanes and toll booth. When the toll collector calls up on the intercom, the manager can comprehend the situation at the lane by a zoomed view of the particular lane.

3.13.3 Workstations in Control Room, POS room

Workstations are available in control room (lane monitoring, administration, and audit), cash room and PoS.

POS room at Toll Plaza

3.14 Advanced Traffic Management System (ATMS)

Advanced Traffic Management System (ATMS) installed for the project road is controlled by the ATMS center at the toll plaza location (km 467.700). As per Concession agreement ATMS shall conform to ATMS Policy guidelines (2016) which comprises of the following:

- Automatic Traffic Counter cum Classifier (ATCC)
- Mobile Radio Communication System (MRCS)
- Emergency Call Box (ECB)
- Portable Weigh in Motion
- Meteorological Data system

- Variable Message Signboards (VMS)
- CCTV system
- Video Incident Detection System (VIDS)
- Vehicle actuated Speed Display (VASD)

Status of these systems at site is described below:

3.14.1 Automatic Traffic Counter cum classifier (ATCC)

Automatic Traffic Counter cum Classifiers (ATCC) is not installed at Toll Plazas.

3.14.2 Mobile Radio communication System (MRCS)

Mobile Radio communication System (MRCS) is not yet installed.

3.14.3 Emergency Call Boxes (ECB)

Emergency Call Box (ECB) are missing at many locations on the Project Road. The Concessionaire has already purchased the required material for installation. It is informed that the work of installation will commence soon.

The photographs taken during the site visit are presented below.

Figure 3-21 Photographs of ECB

ECB at km. 21+400 LHS is not working on the project site

3.14.4 MET System

MET system is not yet installed.

3.14.5 Variable Message Signboards (VMS)

VMS is not installed on the Project Road due to land issues. It is informed that the installation work of VMS will start soon.

3.14.6 CCTV Surveillance Cameras

Surveillance cameras are installed as per CA requirement along the Project Road. The HTMS control room has video wall to monitor these locations through the cameras installed.

The photographs taken during the site visit are presented below.

Figure 3-22 Photographs of CCTV Surveillance Camera

CCTV at Toll Plaza-2

CCTV at Toll Plaza-3

3.14.7 Video Incident Detection System

CCTV cameras are installed as part of Video incident detection system.

Figure 3-23 Photographs of CCTV Surveillance Camera

Surveillance Camera at km. 102+430

Surveillance Camera at km. 141+850

3.14.8 Adequacy of Toll Collection System and ATMS

- Adequacy - All lanes are hybrid ETC system as stipulated by NHAI in technical specifications of Hybrid ETC system. NHAI has approved maintenance costs for TMS. TMS shall be upgraded every 5 years at the cost of the Authority.
- Advanced Traffic Management System (ATMS) installed is as per specifications required by the Authority and in working condition. Some components such as ATCC, ECB, MET system and MRCS have not been installed.

3.15 Truck Lay-bye

There are 05 Nos. of truck lay-bye without facilities such as Toilet Blocks on Project Road.

The photographs taken during the site visit are presented below.

Figure 3-24 Photographs of Truck Lay-bye

Truck lay bye at km. 19+900 (LHS)

Truck lay bye at km. 127+650 (RHS)

3.16 Bus Bays and Passenger Shelters

The Concessionaire has constructed 23 Nos. of bus bays and passenger shelters along Project Road.

The photographs taken during the site visit are presented below.

Figure 3-25 Photograph of Bus Bay / Passenger Shelter

Bus Bay and Shelter at km. 4+390 LHS

Bus Bay Shelter at km. 99+630 LHS

Bus Bay Shelter at km. 101+950 LHS

Bus Bay and Shelter at km. 107+500 LHS

3.17 Balance Work Status

For the execution of balance works as per Concession Agreement, the Concessionaire has executed an 'AMENDMENT AGREEMENT' with M/s. Ramky Infrastructure Limited on 11th August 2020. This agreement is an amendment to the Engineering Procurement & Construction Agreement dated 30-Nov-2008.

M/s. Ramky Infrastructure Limited, being the earlier promoter for this Project, the scope of the work is defined through a fixed Bill of Quantities and Rates. The Agreement value was fixed on a lump sum basis. The details of the Contract value are as follows.

1. Part-A - Rs. 74.12 Crores (work to be executed by M/s. Ramky)
2. Part-B - Rs. 24.13 Crores (work to be de-scoped at own cost of M/s. Ramky)
3. **Total - Rs. 98.25 Crores**

As per the details provided by the Concessionaire, the work executed as per the Amendment Agreement till end of 28th February 2025 is Rs. 46.07 Crores.

Thus, the balance work as on 28th February 2025 is worked out be 52.18 Crores.

3.18 Operation and Maintenance

a) O&M Contract

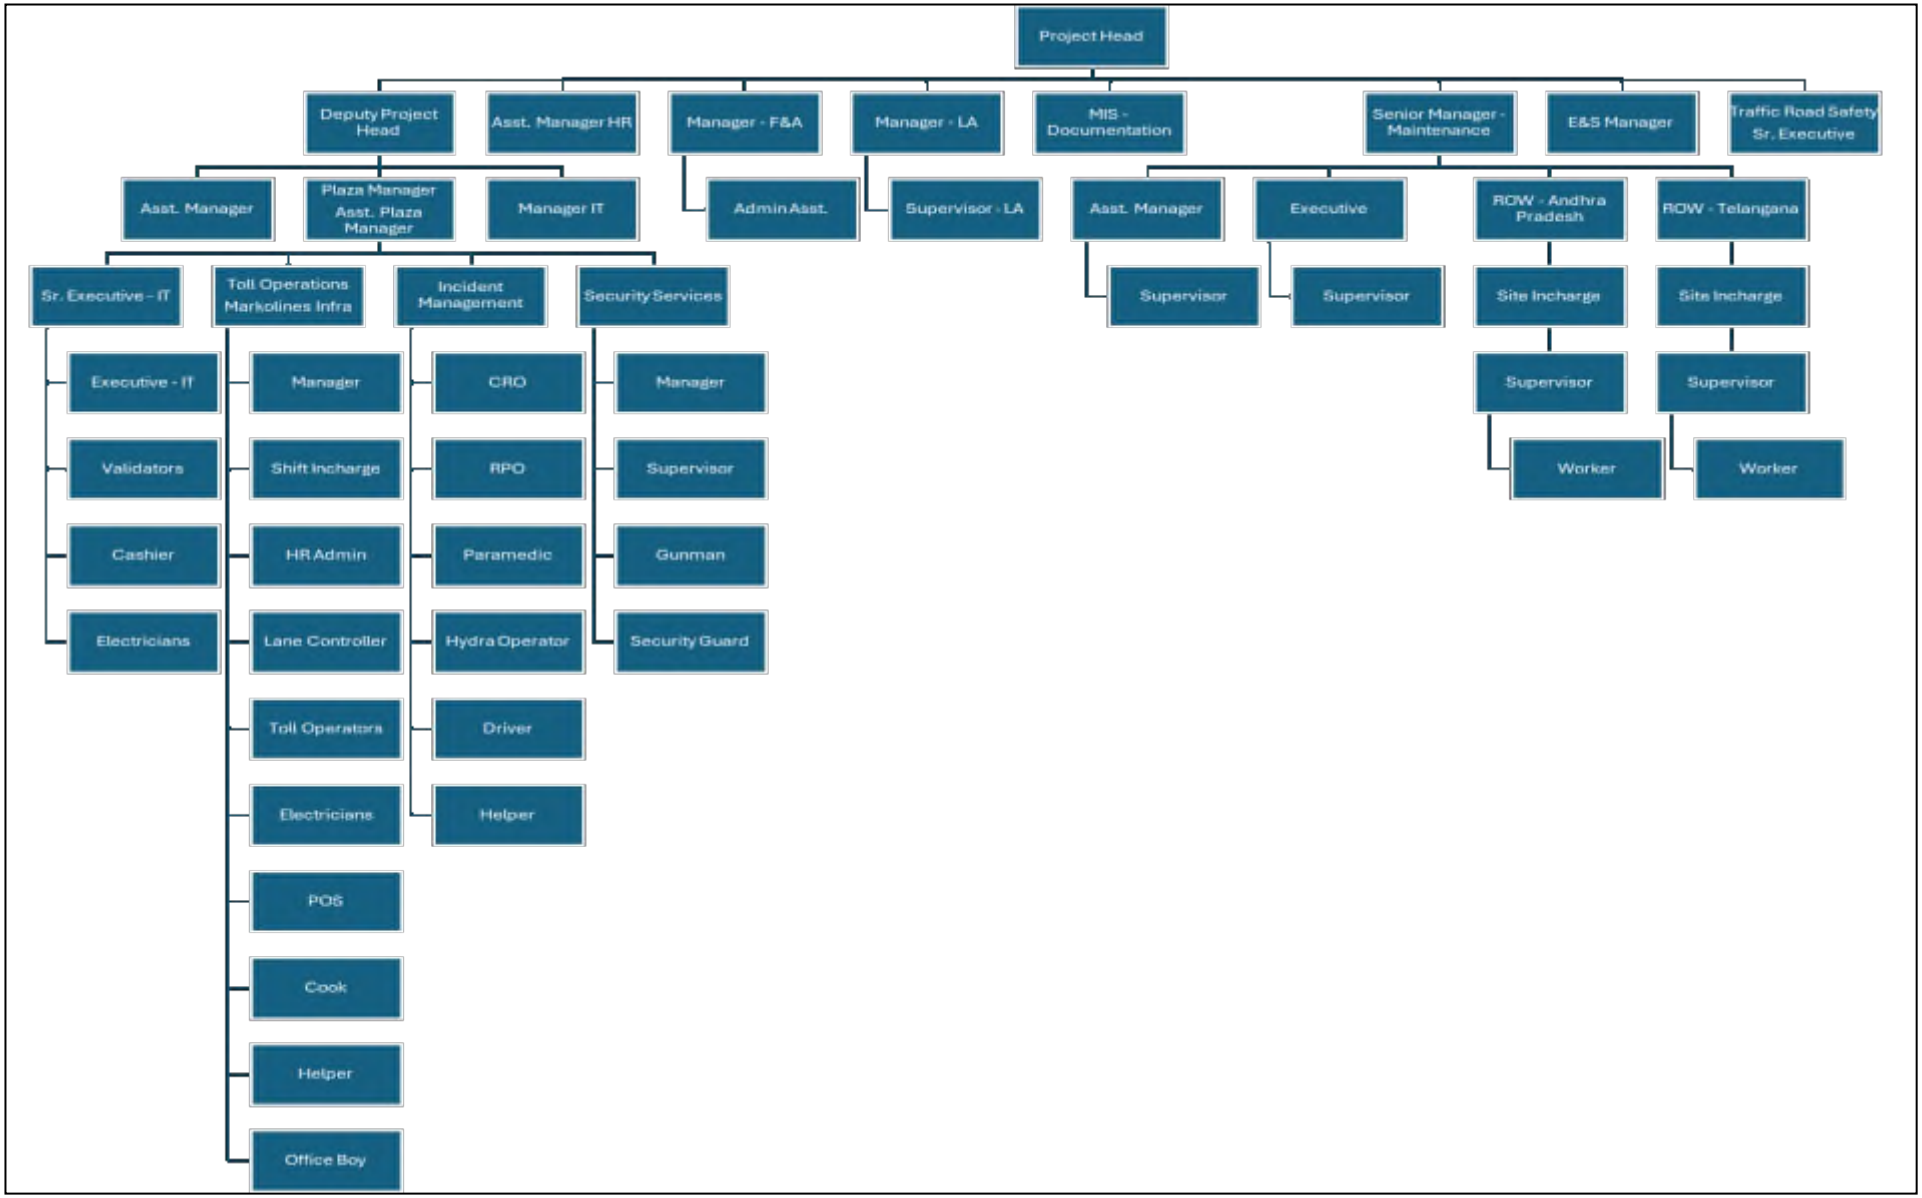
As per Article 17 of the Concession Agreement, the Concessionaire shall operate and maintain the Project Road by itself, or through O&M Contractors and if required, modify, repair, improve the Project Road to comply with Specifications and Standards, and other requirements set forth in the Agreement through Good Industry Practice, Applicable Laws and Applicable Permits and manufacturer's guidelines and instructions with respect to toll systems. The Operation and Maintenance activities shall meet all the requirements laid down in the Concession Agreement.

The Concessionaire has outsourced for carrying out the activities related to operation and maintenance of the Project Road including toll operation services, security services, Incident management service.

b) Organization Chart

The Concessionaire has provided the Organization Chart for Operation and maintenance. The team controls the maintenance activities. However, the maintenance work is undertaken and executed through competent sub-contractors.

Organization Chart



c) Operation

The Operation Cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses and other miscellaneous expenses. The Concessionaire has provided the expenses occurred towards operation expenses for past years. Necessary assumptions have been made from the expense of similar types of projects to arrive at the operation cost. The estimates are projected based on the best industry practices and are compared with the operating cost in the vicinity of the project area.

The Operation Cost is presented in the subsequent chapter.

d) Routine Maintenance

The Routine Maintenance Cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey.

Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Maintenance Cost is presented in the subsequent chapter.

4 PAVEMENT INVESTIGATION AND ASSESSMENT

4.1 General

Presently, the pavement of the Project Road is being maintained by the Concessionaire as per Scope of Work. The Concessionaire has received a Provisional Completion Certificate on 06th March 2014 for the length of 190.38 kms out of 212.860 kms.

The Project Road is currently in the Operation and Maintenance stage. The concession period of the project is 24 years from the Appointed Date (18th January 2011) including construction period of 2.5 years. The end of scheduled concession period is 17th October 2035. As informed by the Concessionaire, the concession period of the Project Road is likely to extend up to March 2040 on the basis of the traffic data.

4.2 Surveys and Investigation

Pavement Condition Survey

The pavement condition survey was carried out by the Technical Consultant during the period from **16th March 2026 to 19th March 2026** through visual inspection of the total Project Road.

From the visual inspection, the pavement condition of the entire project road is found to be Good to Fair. During the site visit, some rutting and cracks were observed at few of the locations. The Concessionaire is carrying out routine maintenance for Project Road which is witnessed during the site visit.

4.3 Axle Load and VDF

In order to estimate vehicle-loading pattern in the project area, and to determine vehicle damage factor for the commercial vehicles, axle load survey of the vehicles plying on the project road stretch was carried out at three different locations of project stretch.

The Axle load survey was conducted by the Concessionaire at three toll plaza locations. i.e., at km. 41+200, at km. 110+000 and at km. 168+000 in the month of February 2025. The survey was carried out for both directions (LHS and RHS) simultaneously and for 24 hours using standard weigh pads. The survey was carried out using random sample method for goods vehicles i.e., for LCV, bus, trucks and multi-axle vehicles with special axle configuration count. The vehicle damage factors for various categories of vehicles were provided.

The Summary of VDF is presented as below.

Table 4-1 Vehicle Damage Factor

Sr. No.	Vehicle Type	TP at km. 41+200		TP at km. 110+000		TP at km. 168+000	
		Direction		Direction		Direction

4.4 Design Traffic

The Traffic in Million Standard Axles (MSA) for the homogeneous section based on the traffic data as provided by the Concessionaire has been used for future projections. The estimated design MSA is computed and presented in the subsequent table.

For the estimation of design MSA, Actual Traffic Growth Rates as provided by the Concessionaire were used.

Table 4-2 MSA Calculation

MSA Calculations - Madgullapally					
Year	**MSA (LHS)**	**Cumulative MSA (LHS)**	**MSA (RHS)**	**Cumulative MSA (RHS)**	**Remarks**
2025-26	2.54	**2.54**	4.32	**4.32**

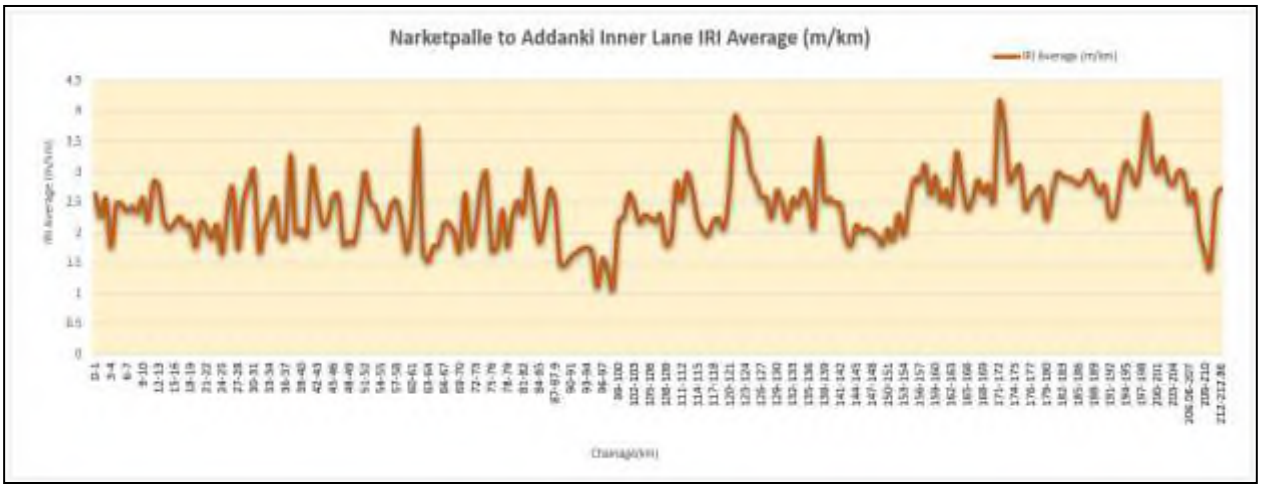
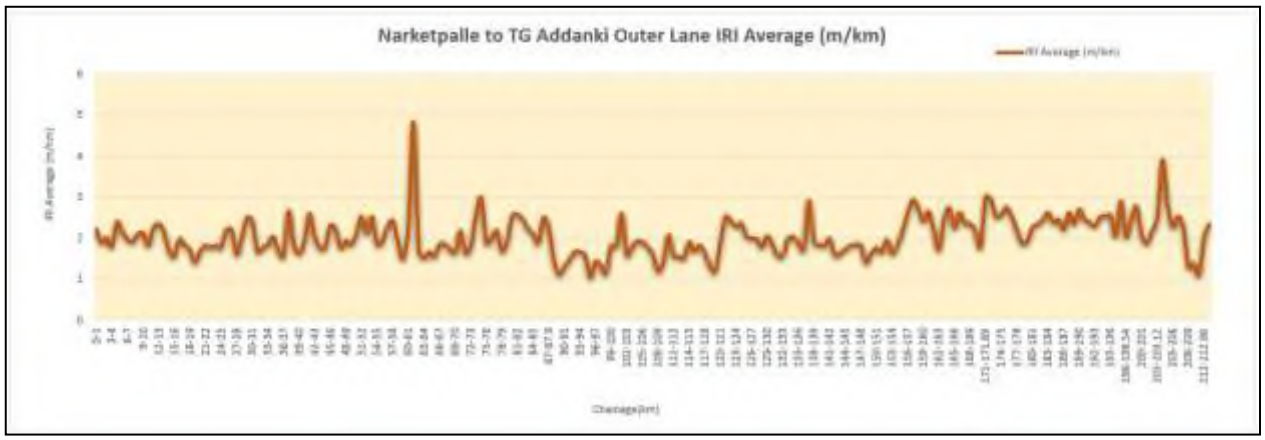
4.5 Network Survey Vehicles (NSV) Survey

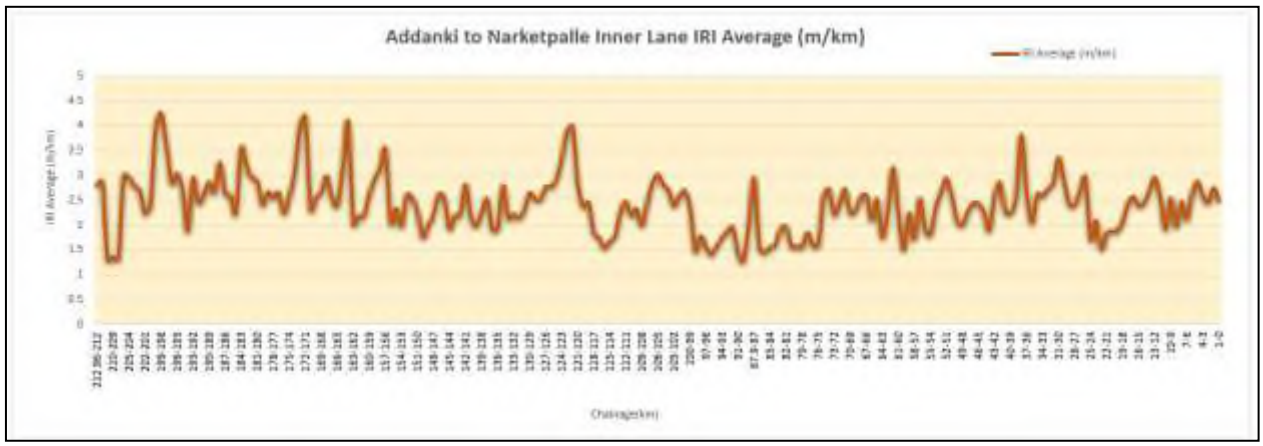
The Concessionaire has provided NSV survey data conducted. The NSV data is used to assess the riding quality and pavement condition of Project Road. The test is carried out in December 2025. The summary of classification of pavement as per CA is given in below table.

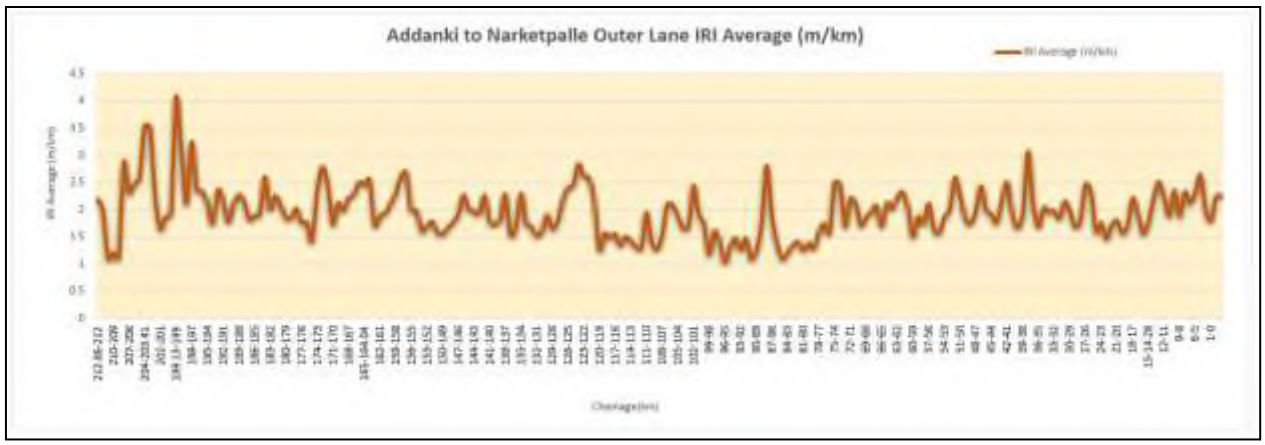
Table 4-3 Result of Roughness Survey

BI (mm/Km)	LHS				RHS			
	Outer		Inner		Outer		Inner	
	Length (Km)	Length (%)	Length (Km)	Length (%)	Length (Km)	Length (%)	Length (Km)	Length (%)
<2750	205.57	98.10	209.80	99.06	205.57	98.10	210.85	99.53
>=2750	4.00	1.90	2.00	0.94	4.00	1.90	1.00	0.47
Total	209.57	100.00	211.80	100.00	209.57	100.00	211.85	100.00









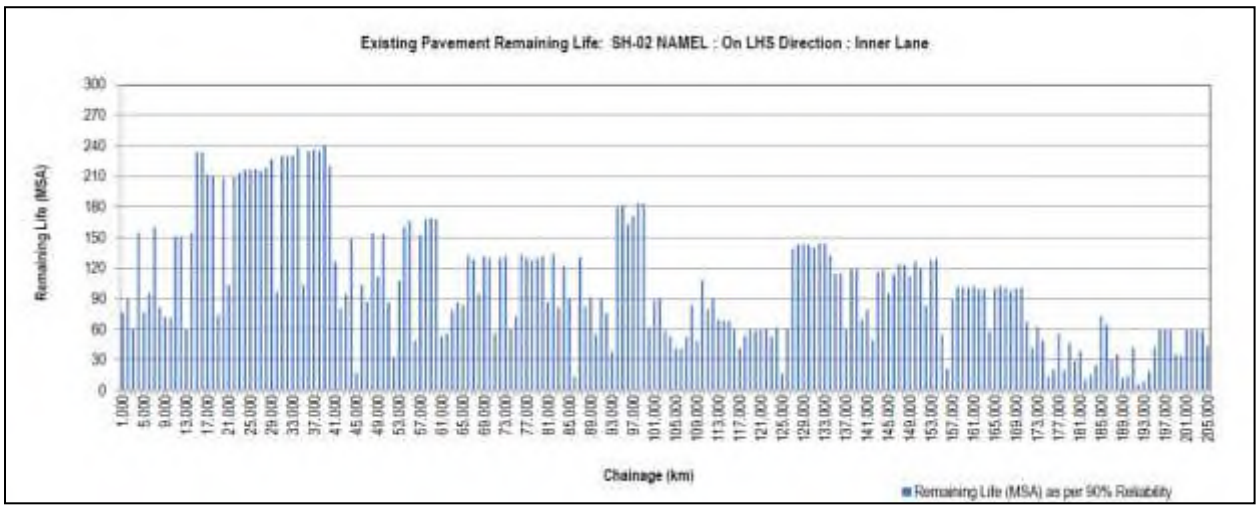
Observation and Conclusion:

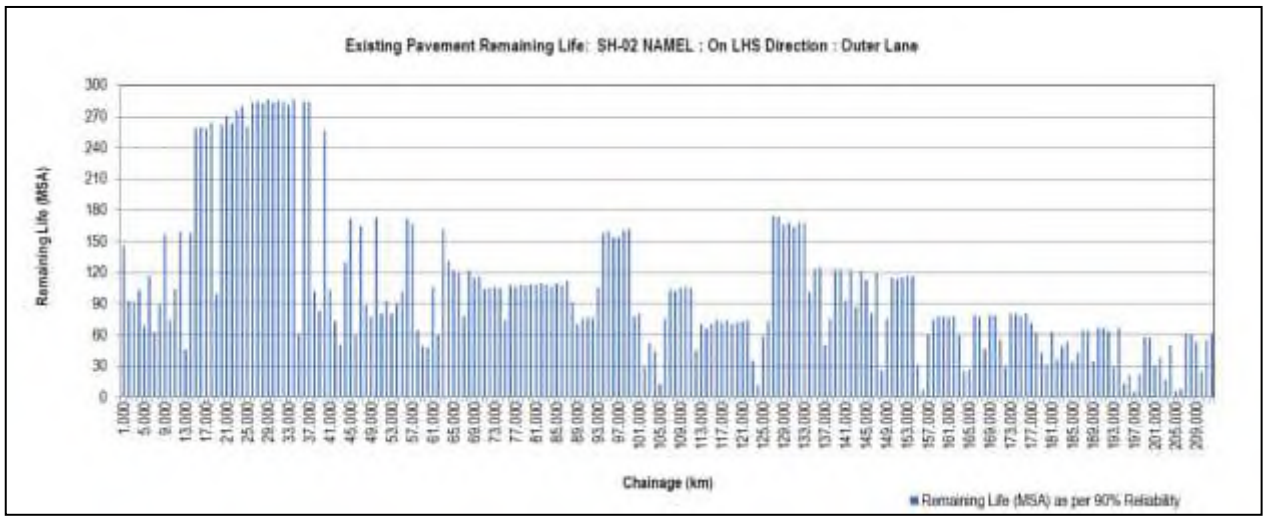
As per the NSV test carried out in the month of December 2025 and the related Roughness results provided by the Concessionaire, it was observed that the overall pavement condition for the Project Road is found to be Good for 98.65% length (208.95 kms) and Poor for 1.35% length (3.48 kms). Poor road surface condition is maintained as part of routine maintenance; hence no additional expense is necessary to be considered when calculating major maintenance costs.

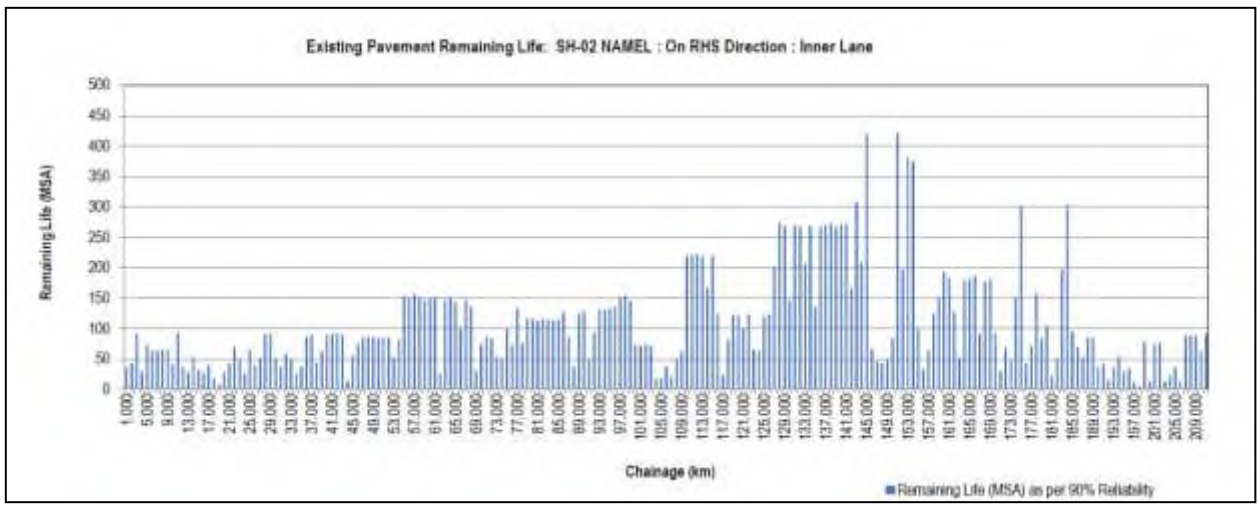
4.6 FWD Survey

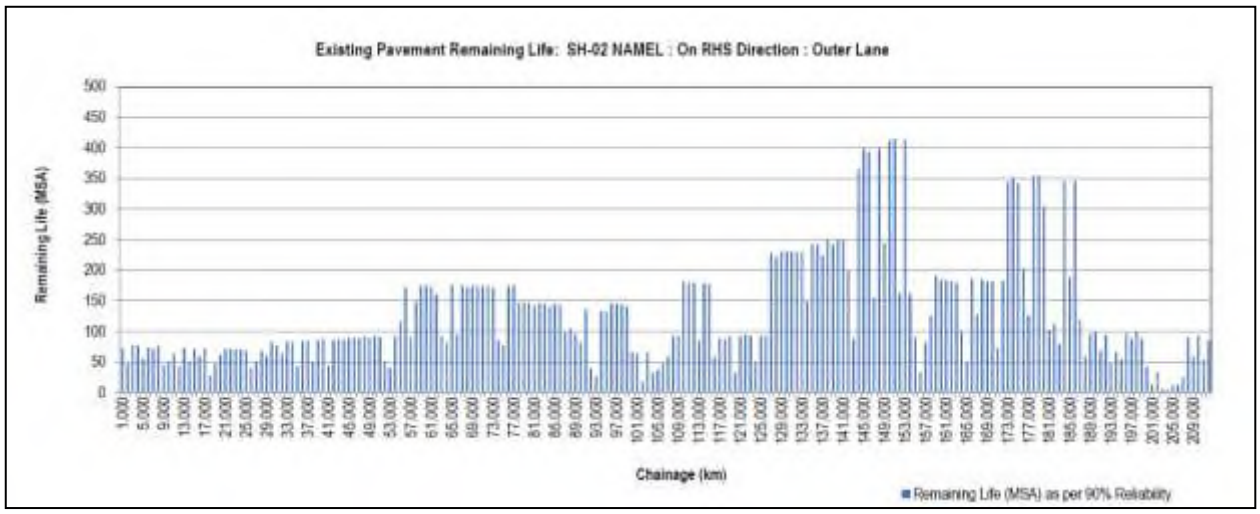
The structural evaluation and analysis of the remaining life of project was carried out in conformity with IRC:115-2014 “Guidelines for Structural Evaluation and Strengthening of Flexible Road Pavements Using Falling Weight Deflectometer (FWD) Technique”.

The FWD survey was conducted on the Project Road in December 2025. The summary of the same is presented below.









However, the maintenance can be carried out on as and when required basis and to the compliance of Schedule-K requirement to maintain the road in serviceable condition. However, improvement in Riding Quality is expected if the roughness value exceeds 2500 mm/km.

4.7 Periodic Maintenance Strategy

Unlike the old Concession Agreements where periodicity and threshold limits were clearly described for the major maintenance, the Concession Agreement of this project does not specify the periodicity or the threshold limits for carrying out the full-length periodic maintenance. Schedule-K of the Concession Agreement specifies the threshold limits and the timeline for carrying out repairs to the distresses during the operation period.

The maintenance thus can be carried out as and when required basis and to the compliance of Schedule-K requirement to maintain the road in serviceable condition. Only improvement in Riding Quality is expected if the roughness value exceeds 2750 mm/km.

The Provisional Completion Certificate for the project was achieved on 06th March 2014. Hence, the major maintenance cycle is projected accordingly.

Currently Major Maintenance (Cycle-1) work for Section-3 from Km. 155+000 to Km. 212+500 is in progress. For the entire length of the Phase-3, 40 mm BC overlay with PMB-70 will be done and wherever the distresses are observed, those stretches (around 7% of the total Project length) will be rectified with milling & 50 mm DBM (with 35% RAP). Also, there are some stretches in Section-1, where distresses are observed and will be rectified with 35 mm BC (VG-40). Thin White Topping (TWT) of thickness 150 mm will be adopted for Toll Plaza 2 at Km. 110+200, Toll Plaza 3 at Km. 168+200 and Major Junction location at Km. 167+450. As the Service road is in good to fair condition, 30 mm BC Overlay will be done only at distressed locations on the Service road.

The table below shows the major / periodic maintenance cycle throughout the concession period for the Project Road.

Table 4-4 Major Maintenance Cycle

Sr. No.	Chainage (km)		Length (km)	Length (%)	MM Cycle-1		MM Cycle-2	MM Cycle-3
	From	To			LHS	RHS	BHS	BHS
Sec-1	0	77	77	36.24%	MM completed in FY 2024		FY 2028	FY 2036
	77	87	10	4.71%	MM completed in FY 2024	MM completed in FY 2021	FY 2029	
Sec-2	87	120	33	15.53%	MM completed in FY21			
	120	127	7	3.29%	COS		FY 2031	FY 2038
Sec-3	127	155	28	13.18%	MM completed in FY 2024			
	155	212.5	57.5	27.06%	Work in Progress		FY 2033	

Table 4-5 Major Maintenance Strategy

Cycle	Year	BC Overlay	Micro-surfacing	DBM Rehabilitation	Overlay	Rehabilitation	Service road
Cycle 1 Section 3	FY 26	27.00%	-	7.00%	Work in progress		
Cycle 2	FY 28	36.00%	-	3%	100% 40 mm BC Overlay	-	50% Micro-surfacing + 50% BC 30 mm Overlay
	FY 29	20.00%	-				
	FY 31	16.00%	-				
	FY 33	28.00%	-				
Cycle 3	FY 36	41.00%	15.00%		73% 30 mm BC Overlay 27% Micro-surfacing	5% 50 mm DBM Rehabilitation	50% Micro-surfacing + 50% BC 30 mm Overlay
	FY 38	32.00%	12.00%				

The projected cost for periodic / major maintenance is presented in the subsequent chapter.

5 COST ESTIMATES

5.1 General

Based on the assessment carried out in previous chapters, various costs were worked out. The costs are divided into following categories.

I. Balance Works Cost (CAPEX)
II. Routine O&M Cost
III. Major Maintenance Cost
IV. Periodic Replacement of TMS system

Costs for different category are detailed out in subsequent sections along with the assumptions considered for rate and escalation.

5.2 Rate Assumption

Following assumptions are considered for unit rates of various items while estimating the cost:

1 Unit rates of different items (BC, DBM, Concrete, etc.) are calculated as per the MoRTH Standard Data Book 2019. The input rates for MoRTH standard data book were adopted as below:

a) **Manpower and labour:** As per applicable minimum wages published by Ministry of Labour & Employment, Government of India.

b) **Bitumen:** Concessionaire has long term contract with IOCL for the procurement of bitumen and related products. Same discounts are considered on bitumen procurement for this analysis. Furthermore, we also understand that bitumen prices are primarily dependent on crude oil price and market demand and hence are likely to be very volatile and difficult to predict at this stage.

Therefore, bitumen prices are considered as per the forecast of Client. Current published of bitumen are considered for unit rates calculation for FY 2027. Average 10 years of price of bitumen are considered for unit rates calculation for FY 2028 and onwards. Following rates of bitumen are considered.

Polymer cost and modification costs are provided by client to work out BC rate with PMB.

Table 5-1 Bitumen Rates - Ex-MI Supply excluding discount and GST

Sr. No.	Supply Location	Applicability of Rates	Product	Rate for FY2027 (Rs. / MT)	Rate for FY2028 onwards (Rs. / MT)
1	Mathura,	All States	VG10	45,102	35,125
2			VG30	46,402	36,137
3			VG40	48,962	38,131
4	Panipat	All States	VG10	45,102	35,125
5			VG30	46,402	36,137
6			VG40	48,962	38,131
7	Koyali	All States	VG10	47,102	37,125
8			VG30	48,402	38,137
9			VG40	51,082	40,251

Sr. No.	Supply Location	Applicability of Rates	Product	Rate for FY2027 (Rs. / MT)	Rate for FY2028 onwards (Rs. / MT)
10	Haldia	All States	VG10	46,602	35,683
11			VG30	47,402	36,295
12			VG40	49,962	38,256
13	Barauni	All States	VG10	47,132	36,213
14			VG30	48,432	37,325
15			VG40	50,992	39,286
16	CPCL	Kerala	VG10	47,402	35,519
17			VG30	48,402	36,395
18			VG40	50,762	38,120
19	CPCL	Tamil Nadu	VG10	47,902	36,019
20			VG30	48,402	36,395
21			VG40	50,962	38,320
22	CPCL	Telangana and Andhra Pradesh	VG10	44,602	32,719
23			VG30	45,402	33,395
24			VG40	47,962	35,320
25	CPCL	Karnataka	VG10	44,602	32,719
26			VG30	45,402	33,395
27			VG40	47,962	35,320

c) **Sand and Aggregate:** Market rates are considered from the quarry located nearest to Project Road.

d) **Cement:** Market rates are considered from the nearest local market.

e) **Steel :** Rate of steel is taken from SAIL.

f) **Machinery Hire charges:** Hire charges for the machinery are considered in accordance with applicable PWD SOR.

g) **Rates of items as per Work Order:** The rates of items such as kerb raising, micro-surfacing, milling, road stud etc. are based on the actual rates at which the work to be executed and thus are considered as per the Work Orders shared by the Client which is issued to the Contractors executing these works at the site.

2 Goods and Service Tax (GST) is considered as 18% as per the latest Government Guidelines.

Summary of Unit Rates worked out using Standard Data Book adopted for major items is given below.

Table 5-2 Summary of Unit Rates

Sr. No.	Item Description	Unit	Rates
1	PMB 70-10V	Cum	12,289
2	Dense Bituminous Macadam	Cum	9,391
3	Bituminous Concrete	Cum	10,542
4	Milling	Sqm	90
5	Micro-surfacing	Sqm	180
6	Kerb Re-laying	Rmt	268
7	Road Marking	Sqm	545

Sr. No.	Item Description	Unit	Rates
8	Road Studs	Nos.	247

5.3 Balance Work Cost (CAPEX)

As discussed in the earlier chapter, the cost of Balance Work is **Rs. 52.18 Crores**.

5.4 Routine O&M Cost

Routine O&M cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses, horticulture and ROW maintenance, routine maintenance, and other miscellaneous expenses. The Concessionaire has provided the major agreements towards operation and maintenance for past years. Necessary assumptions have made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area. Same has been divided into following major heads:

1. Salary and Welfare Expenses
2. Tolling Operations Services
3. Toll Security Services
4. Incident Management Services
5. Electricity and Diesel Charges
6. TMS / HTMS / System Expenses
7. Office Operating Expenses
8. Vehicle Running Expenses
9. Professional Fees Expense
10. Community Development
11. Communication Expenses
12. Conveyance Expenses
13. Insurance Expense
14. IE Fees
15. Horticulture & ROW Maintenance
16. Routine Maintenance Cost
17. Contingency

In above, the Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey. Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Operation Cost is presented as below. The detailed working of routine maintenance (Sr. No. 15 of below table) is presented in **Annexure-I**.

Table 5-3 Summary of Operation Cost

Sr. No.	Particulars	Amount (FY 2027- 40)
1	Salary and Welfare Expenses	4,15,65,600
2	Tolling Operations Services	4,14,41,562
3	Toll Security Services	1,26,50,813
4	Incident Management & Emergency Services	4,87,34,335
5	Electricity and Diesel Charges	1,37,94,013
6	TMS/HTMS/System Expenses	1,00,48,187
7	Office Operating Expenses	1,19,21,250
8	Vehicle Running Expenses	69,60,000
9	Professional Fees Expense	3,50,62,500
10	Community Development	58,43,750
11	Communication Expenses	14,02,500
12	Conveyance Expenses	15,19,375
13	Insurance Expense	3,03,87,500
14	IE Fees	1,98,22,000
15	Routine Maintenance Cost (Project Highway)	9,67,91,805
16	Horticulture & ROW Maintenance	5,89,14,535
17	Miscellaneous including Contingency	1,40,57,669
	Total Cost (Rs.)	**45,09,17,395**
	Total Cost (Cr.)	45.09
	Per km Cost (Lakh)	**21.22**

5.5 Major Maintenance Cost

The summary of Major Maintenance Cost is provided as below. The detailed working of the same is presented in **Annexure-II**.

Sr. No.	Year	Major Maintenance Cost (Cr.)	Remarks
1	FY 2028	99.15	
2	FY 2029	56.02	
3	FY 2031	45.24	
4	FY 2033	77.59	
5	FY 2036	96.73	
6	FY 2038	76.00	
Total Cost (Cr.)		**450.73**	

5.6 Periodic Replacement of TMS /System

Every 7 years, replacement of cost of major TMS system is considered. The same is provided as below.

Sr. No.	Year	TMS O&M / Replacement Cost (Cr.)	Remarks
1	FY 2027	1.83	
2	FY 2034	1.83	
Total Cost (Cr.)		**3.66**	

5.7 Escalation Assumption

The following escalation is considered basis discussions with Client and our internal estimates.

Table 5-4 Escalation

Year	Escalation	Year	Escalation
2027	-	**2041**	3.99%
2028	5.25%	**2042**	3.99%
2029	4.86%	**2043**	3.99%
2030	4.44%	**2044**	3.99%
2031	4.24%	**2045**	3.99%
2032	4.13%	**2046**	3.99%
2033	4.08%	**2047**	3.99%
2034	4.01%	**2048**	3.99%
2035	4.00%	**2049**	3.99%
2036	4.03%	**2050**	3.99%
2037	4.01%	**2051**	3.99%
2038	3.98%	**2052**	3.99%
2039	3.98%	**2053**	3.99%
2040	4.00%	**2054**	3.99%
2040	3.99%	**2055**	3.99%

5.8 Summary of Cost

Different O&M cost have been worked out based on the investigations and assessment on Project Road. Cost for each of the category has already discussed in previous sections. Since the forecasting has been carried out for remaining concession period, the cost is summaries yearly for remaining concession period along with escalation as mentioned in clause 5.7.

Escalated O&M Cost (in INR Cr.)

Sr. No.	Year of expense	FY27	FY28	FY29	FY30	FY31	FY32	FY33	FY34	FY35	FY36	FY37	FY38	FY39	FY40

ANNEXURES

ANNEXURE I - ROUTINE MAINTENANCE COST

Routine Maintenance Cost	
Project - Narketpally to Medarametla	
Ordinary Repair Cost for Flexible (with GST)	**9,67,91,805**
(inclusive of GST)	**= 4.55 lakhs per km**

CONVERSION FACTORS									
National Highways / State Highways									
Reference cost taken for Two / four lane (7.0 or 14m or 21m) with 1.5m wide shoulders									
(Refer Chapter 6.17 of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 45)									
Sr. No.	**Description for Flexible Pavement**		**Factor**	**Normal** More than 4500 CVD **2,55,147**	**Urban** More than 4500 CVD **2,92,255**	**Project Length (km)**		**Per Year Project Maintenance Cost**	
						Normal	**Urban**	**Normal**	**Urban**
1	Four-lane with divided carriageway	Without paved shoulder	1.53	390374.00	447151.00	-	-	-	-
		Paved shoulder	1.70	433749.00	496834.00	191.40	-	8,30,19,559	-
2	Four-lane with divided carriageway and service lane on either side	Without paved shoulder	2.00	510293.00	584511.00	-	-	-	-
		Paved shoulder	2.20	561323.00	642962.00	-	21.42	-	1,37,72,246
					TOTAL	**212.820**		**9,67,91,805**	

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity** **More than 4500 CVD** **BT Surface**
1	**2**	**3**	**4**	**5**
1	**Maintenance of Carriageway & Paved Shoulders (1.5m wide); B.T. Surface**			
	i) Pot holes repair (50 mm deep)	100 % Pot hole free	As & when required	1.00%
	Volume (cum)			5.00
	Rs/m^3			11004
	Cost in Rupees			55,018
	ii) Patch repair	100 % Patch less	As & when required	1.00%
	Area (sqm)			100
	Rs/m^2			440
	Cost in Rupees			44,014
	iii) Sealing (Crack)			
	a) Wider than 3 mm	100 % Crack Less	As & when required	1.00%
	Area (sqm)			100
	Rs/m^2			87
	Cost in Rupees			8,728
	b) Width less than 3 mm	75 % Crack Less	As & when required	1.00%
	Area (sqm)			75
	Rs/m^2			58
	Cost in Rupees			4,338
	iv) Repair of ruts and undulations			
	a) Greater than 20 mm	75%	As & when required	1.50%
	Area (sqm)			112.5
	Rs/m^2			440
	Cost in Rupees			49,516
	v) Road marking	14%	Once in 7th year & @ Repaired location	27679
	SUB TOTAL			**1,89,293**

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity** **More than 4500 CVD** **BT Surface**
1	**2**	**3**	**4**	**5**
2	**Maintenance of earthen Shoulders:**			
	i) Renewal of earthen shoulders	80%	Once in a Year	6322
	ii) Kuccha Drain Maintenance	100%	Twice in a Year	1111
	SUB TOTAL			**7,433**
3	**Maintenance of Cross Drainage works:**			
	i) Repair of floors	100%	Once in a Year	5067
	ii) Repair of parapets	100%	As & when required	2111
	SUB TOTAL			**7,178**
4	**Maintenance of Minor & Major Bridges:**			
	i) Spot painting & protective Coating required on Bearing and greasing of Bearings, railing, structural members, Expansion joints	100%	As & when required	37,043
	ii) Repair of minor washouts, erosion scour and animal holes			
	iii) Sealing Cracks with Cement/ Epoxy Mortar			
	iv) Replacement & Correction of safety barriers, Guard rails and damaged members			
	SUB TOTAL			**37,043**
5	**Miscellaneous Items:**			
	i) Lettering, Painting of Km stones & kerbs, sign boards, hectometer stone etc.		Once in a Year	3704
	ii) Replacement and providing additional retro reflective signage	25%	Covering Total Network in 4-5 Years	9261
	iii) Providing first aid kits, Umbrella, Safety Jackets, Vardi etc.		Once in a Year	1235
	iv) Traffic Census		Once in a Year	0
	v) Provision for roughness measurement		Twice in a Year	0
	SUB TOTAL			**14,200**
	GRAND TOTAL (Normal)			**2,55,147**

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity** **More than 4500 CVD** **BT Surface**
1	**2**	**3**	**4**	**5**
6	**Additional Cost required for Urban Area**			
	i) Renewal of Center Line, Edge Marking, Kerb Marking/ Zebra crossing etc. in City Portion	33%	Once in three years with thermoplastic paint	7228
	ii)Repairs to footpath	100%	As & when required	4939
	iii) ROB/ Fly-over Railings & repair	100%	As & when required	4939
	iv) Street Lighting	0%	As & when required	0
	v) Encroachment Removal Squad	100%	As & when required	7655
	vi) Repair of divider/ Railing in City portion	100%	As & when required	9878
	vii) Provision for maintenance of pedestrian underpass	100%	As & when required	2470
	SUB TOTAL			**37,109**
	GRAND TOTAL (Urban)			**2,92,255**

1 INTRODUCTION

1.1 Background

Cube Highways Fund Advisors Pvt. Ltd. (hereinafter referred as "the Client") is the Investment Manager of the Cube Highways Trust ("Trust" or "InvIT"). The Trust is registered with Securities and Exchange Board of India ("SEBI") as an Infrastructure Investment Trust under the SEBI InVIT Regulations. Cube Highways Fund Advisors Pvt. Ltd. has appointed **M/s. FP Project Management Consultancy Services Private Limited** (hereinafter referred as "Technical Consultant" or "FPPM") to carry out Technical Due Diligence of Nelamangala - Devihalli Section of NH-75 from km. 28+200 to km. 110+000 in the State of Karnataka (hereinafter referred as "Project Road").

Nelamangala - Devihalli Expressway Private Limited (hereinafter referred as "Concessionaire") is a special purpose vehicle (SPV) for widening of Nelamangala - Devihalli Section (from km. 28+200 to km. 110+000) of NH-75 from 2-lane to 4-lane and its Improvement, Operation and Maintenance through a concession on Build, Operate and Transfer (BOT) basis. The project has been taken over by the Client on 11th January 2021 from M/s. Lanco Devihalli Highways Private Limited (LDHPL), with a total concession period of 25 years (commencement of concession period is from 5th January 2008) in concurrence with National Highway Authority of India (NHAI). The length of Project Road is 80.262 kms with first toll plaza at Doddakarenahalli at km. 32+600 and second toll plaza at Karabylu at km. 100+850.

Accordingly, Technical Consultant has undertaken the work of assessment of operation and maintenance (O&M) cost based on site inspections and filed investigations. The same is presented in this report.

1.2 Scope of Work

The detailed scope of work for conducting the technical due diligence of Project Road is presented as below:

- A reconnaissance of the Project Road to understand the current condition of the pavement, structures, road furniture, toll plaza and other highway assets
- Review and assessment of important technical documents like CA, pavement design report, O&M report, DPR, As-built drawings, O&M manual, COD / PCOD certificate, punch list, previous major maintenance etc.
- Review of recent pavement investigations and surveys conducted on Project Road like FWD, NSV, axle load, material investigations etc.
- Formulation of future major maintenance sstrategy
- Estimation of any initial expenses to be incurred due to deficiencies observed in diligence
- Estimation of Routine Maintenance and Major Maintenance forecast for remaining concession period
- Estimation of Annual Operation expenses along with Systems cost (TMS) till the end of concession period
- Review of balance work cost for Project Road including estimation of quantities and item rates

1.3 Our Approach Philosophy

1.3.1 Composition of Team

Our team consists of well-qualified engineers and other professionals, whose experience covers all the skills and specializations required for undertaking such assignments. All the team personnel proposed are our regular employees and have a long and stable working relationship with our firm.

The Team Leader coordinates the activities between all the key staff who work closely together. The key staff is assisted by various support staff, who report to the respective key staff in their field of expertise. The Team Leader is the point of contact for Client on Technical Study.

The technical study includes review of all the available documents namely:

a) Concession Agreement including Technical Schedules
b) O&M Contract, work order and their provisions
c) Quality of construction based on available data, design, and drawings
d) Documents on historical expenditure on operation and maintenance
e) O&M cost schedule for the concession period
f) Review of Completion / Provisional Completion along with punch list items
g) Review of recent pavement surveys conducted.
h) Correspondence regarding scope of works and during O&M
i) Recent O&M Report submitted to Authority
j) Toll operation manual / ATMS related documents

The review of above documents is the first step towards accomplishment of the task. This gives a complete idea of the project and is used as input data for preparation of report after necessary analysis.

1.3.2 Site Visit and Data Collection

A team of experts from various streams has carried out the preliminary site visit to understand the assessment of project assets mainly condition of the pavement and structures.

- The site visit is undertaken for detailed reconnaissance and visual pavement condition assessment.
- The condition assessment of major structures by visual inspection
- The information like material sources and the probable cost is collected for the purpose of cost estimate.

The detailed design / drawings viz. Plan & L-sections, drainage design, structure design, layout drawings for project facilities like toll plaza, bus bay, truck lay-byes, highway lighting facilities etc. are studied. Also, design / drawing and provision pertaining to road furniture are studied.

The information on availability of material in the vicinity is gathered. It has direct impact on cost of maintenance work and balance work.

The basic approach for preparation of cost estimates for operation and maintenance is as per the practice of State PWD / MORT&H in respect of highways and structures.

1.3.3 Data Analysis

Based on the study of the available information and preliminary site visits, the consultants share their preliminary observations with the Client based on the evaluation of the technical data and reports provided by the Client.

1.4 Structure of the Report

This report has been prepared based on the information, reports and documents made available to us by the Company. We have also referred to publicly available reports, literature etc. and have made our best efforts to check the authenticity of the information available, analyzing the same as per the best engineering / industry practices.

The site visit and inspection are carried out from **07th March 2026** to **09th March 2026**.

The report is organized with the following chapters for easy understanding of various issues.

Chapter 1 **Introduction:** The chapter gives an overview of the project background, detailed scope of work, approach, and methodology for due diligence studies.

Chapter 2 **Project Description:** The chapter describes existing project features, and overview of project development.

Chapter 3 **Condition Assessment of Project Road:** The chapter presents the details and condition of various essential features of the Project Road based on site visit.

Chapter 4 **Pavement Investigation and Assessment:** The chapter describes the summary of pavement surveys and investigations carried out on Project Road along with the requirement of pavement maintenance.

Chapter 5 **Cost Estimates:** The chapter summarizes the forecast for O&M and major maintenance cost over the remaining concession period.

2 PROJECT DESCRIPTION

2.1 Introduction

National Highways Authority of India signed the Concession Agreement with **Nelamangala Devihalli Expressway Private Limited**, is a company promoted by M/s Lanco Devihalli Highways Private Limited (LDHPL) or a Special Purpose Vehicle (SPV) formed for implementing this project on 9th July 2007. The Appointed Date for the Project Road is 5th January 2008. The project has been taken over by the Client on 11th January 2021 from M/s. Lanco Devihalli Highways Private Limited (LDHPL).

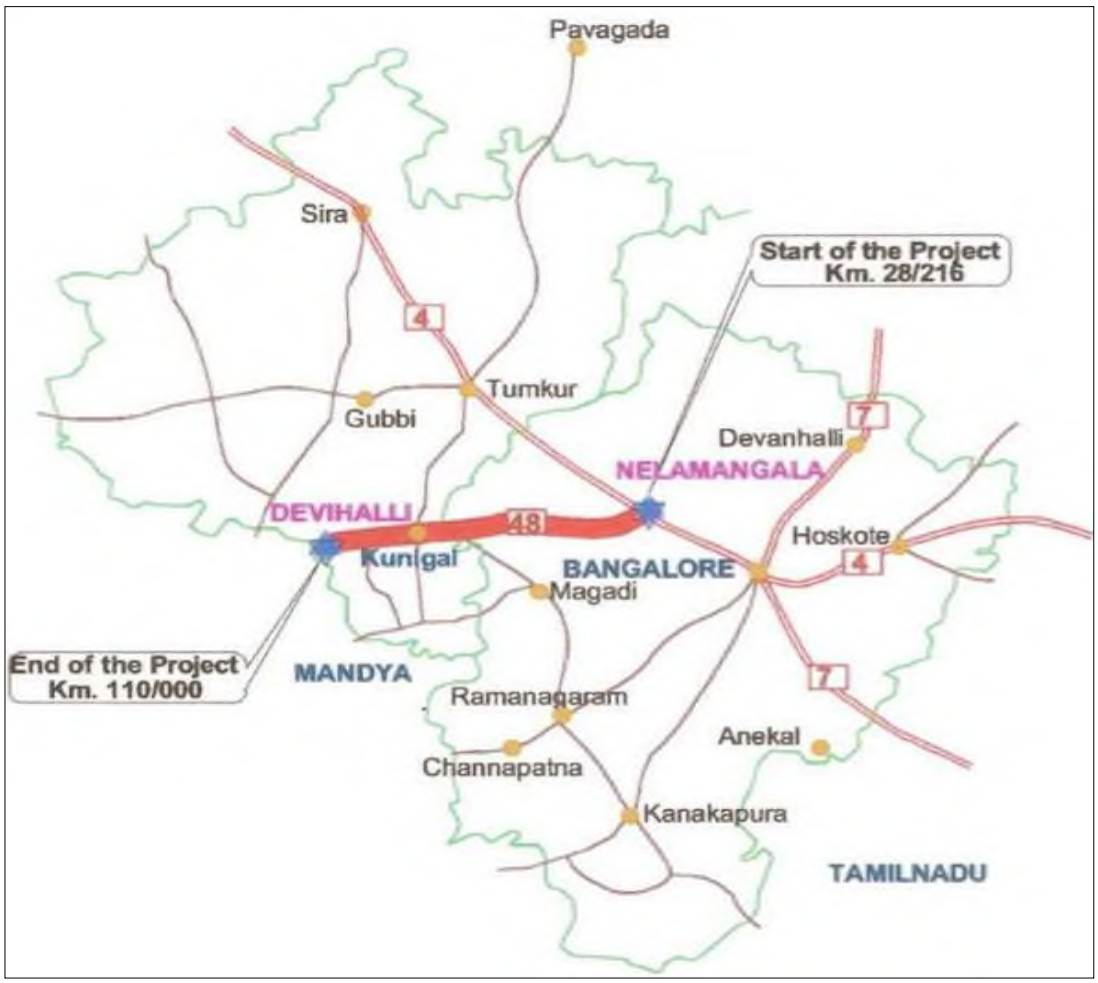
The project has been developed on Build, Operate and Transfer (BOT) basis with concession period of 25 years from the Appointed Date while O&M has started from 23rd June 2012, as PCOD for the project is granted on 23rd June 2012.

2.2 Location of the Project Road

The Project Road is part of National Highway No. 75 of Nelamangala - Devihalli section in the state of Karnataka. The total project length is 80.262 kms.

The Location Map of the Project Road is presented below:

Figure 2-1 Location Map



The photographs taken during the site visit are presented below.

Figure 2-2 Start of Project Road

Figure 2-3 End of Project Road

2.3 Climate

The climate of the project area is generally dry except during the South-West monsoon season between June and September / October. The average annual rainfall in the area is around 600 mm. The driest month is January. Most precipitation falls in October. The average annual temperature of the project area is 28.00C, April being the warmest month.

2.4 Terrain

The Project Road traverses through plain / rolling terrain.

2.5 Abutting Land Use

The land use along the highway is predominantly agriculture or barren and rocky.

2.6 Right of Way

The width of the existing Right of Way (RoW) throughout the project stretch is 60.0 m.

2.7 Existing Utilities

During widening of the Project Road, various affected utility services were shifted to proposed ROW. The different types of utilities found along the road include, electrical poles, telephone poles, OFC Cables, etc.

2.8 Development as per Schedule-B

The Project Road from Nelamangala (km. 28+200) to Devihalli (km. 110+000) has been developed as a four-lane divided carriageway with a median width of 2 m, service road and other arrangements. The Project Road passes through rural as well as built-up sections.

Following is the Scope of Work as per Schedule-B of Concession Agreement.

Table 2-1 Details of Scope of Work

Sr. No.	Type of Structure	Unit	Scope	Remark
1	O&M of Main Carriageway	km.	80.262	From June 2012
2	Construction of Service Road	km.	44.174	Both Side
3	Major Bridges	Nos.	02	
4	Minor Bridges - 03 lane	Nos.	17	
5	Minor Bridges - 06 lane	Nos.	06	
6	Repair & extending of Box Culvert	Nos.	09	
7	Repair & extending of Pipe Culvert	Nos.	73	
8	New Pipe Culvert construction	Nos.	17	
9	Repair of Pipe Culvert	Nos.	04	
10	Pedestrian Underpass	Nos.	06	
11	Vehicular Underpass	Nos.	09	
12	Cattle Underpass	Nos.	08	
13	ROB	No.	01	

3 CONDITION ASSESSMENT OF PROJECT ROAD

3.1 Pavement

The Project Road is four lane divided carriageway and generally has a paved carriageway of 9.0 m with an earthen shoulder of 1.5 m on either side. The Project Road has a median width of 2.0 m throughout its length.

The entire stretch of Project Road including service road is constructed with flexible pavement. The pavement type for the Toll Plaza including taper is of rigid pavement.

3.1.1 Pavement Condition Survey

Pavement condition survey was carried out from **07th March 2026** to **09th March 2026,** through visual inspection for the entire project length. From the visual inspection, it is found that the average pavement condition of the Project Road is found to be Fair to Good.

Some of the photographs taken during the site visit are presented as below.

Figure 3-1 Photographs of Pavement Condition (MCW)

km. 38+950

km. 99+007

km. 95+020 - Patch work (RHS)

km. 97+030-Patch work (RHS)

3.2 Service Road / Slip Road

The service road with width of 5.5 m is constructed in built-up areas and adjoining underpass locations. The Project Road has total service road length of 48.127 kms and cart track length of 30.580 kms. The photographs taken during the site visit are presented below.

3.4 Condition Survey of Bridge

The inventory of structures including major bridges, minor bridges, ROB's, underpasses and culverts is presented in table as below:

Table 3-1 Details of Summary for Structures

Type of Structure	Number of Structures
Major Structures:	
Road Over Bridge (ROB)	1
Overpasses	Nil
Flyover	Nil

Type of Structure	Number of Structures
Vehicular Underpass (VUP)	9
Pedestrian Underpass (PUP)	3
Cattle Underpass (CUP)	12
Major Bridges (MJB)	2
Minor Bridges (MNB)	24
Culverts:	
Pipe Culverts	114
Box Culverts	14
Total	**179**

The detailed condition survey of structures was carried out by visual inspection. The detailed condition survey of structures was carried out from **07th March 2026** to **09th March 2026**. The observations and findings are presented in table below.

Table 3-2 Condition Survey of Major Structure

3.5 Condition Survey of Culverts

The cross-drainage structure includes hume pipe culverts and box culverts at various locations. There are 23 Nos. of pipe culverts, 66 Nos. of box culverts along the Project Road. The height of culvert varies from 1.0 m to 3.0 m from bed level. During the condition survey of structure these culverts were inspected on sample basis.

The project involves strengthening and widening of existing road to four lane divided carriageway. The culverts beneath existing alignment are either widened or reconstructed. The structural condition of culverts is generally found in sound condition. The quality of surface concrete of box culverts is satisfactory. The RCC parapet, crash barrier or RCC railing has been provided at culvert locations, which is maintained properly.

In most of culverts, the waterway is clear. However, near to urban area and some location is found blocked due to debris, drainage water or bushes, tree growth, which will be removed by the Concessionaire. The cement concrete pitching or stone pitching has been provided for slope protection.

The culverts are maintained by the Concessionaire during O&M period. However, in case of some culverts, cement concrete pitching has been damaged which required to be addressed under routine repair work by the Concessionaire.

Figure 3-6 Photographs of Culverts

Pipe culvert at km. 70+383

Box culvert at km. 75+373

3.6 Drainage

There are RCC box drains at the built-up areas and earthen drain at rural areas provided for the Project Road. Lined median longitudinal drain is provided at super-elevated sections. Some of the photographs of the drains provided are presented as below.

Figure 3-7 Photographs of Drainage

km. 29+900 (LHS)

km. 33+800 (LHS)

km. 91+010 (LHS)

3.7 Slope Protection

Slope protection and chute drains are found on Project Road at required locations.

3.8 Road Furniture

The Concessionaire has provided additional road furniture along the Project Road as per the standards and specifications mentioned in Schedule-C. Details of the items are provided below.

a) Lighting Along the Project Road

Lighting including fixing of poles and LED lights are provided at following locations on the Project Road in accordance with Clause 12.3 of IRC:SP:84-2014.

Table 3-3 Details of Lighting on Project Road

Sr. No.	Side	Installed/fitted at	No. of (LED) lights
1	Both Side	Highway lighting at 18 no. of locations	540
2	Both Side	Toll Plaza - 02 nos.	163
3	Both Side	Underpasses-12 nos.	72
		Total in (Nos.)	**775**

b) Transverse / Thermoplastic Bar Marking Locations

Transverse / thermoplastic bar markings on either side of carriageway on proposed service road / VUP / VUP approach locations are provided as per Section 11.2 of IRC:35-2015.

Pavement Marking

Pavement marking for the Project Road is done as per the design standards indicated in section 12 of Schedule-D.

Some of the photographs of the pavement marking provided are presented as below.

Figure 3-8 Photographs of Pavement Marking

km. 39+950 (LHS)

km. 88+390 (RHS)

km. 105+050 (LHS)

km. 42+250 (LHS)

Road Studs

Road studs / Cat's eye for the Project Road is done as per the design standards indicated in section 12 of Schedule-D. Road studs / Cat's eye has been fixed at junction and zebra crossings.

Some of the photographs of the road studs provided are presented as below.

Figure 3-9 Photographs of Road Studs

km. 30+600

km. 92+300

Traffic Signage / Median Kerb painting / KM Stone

Traffic signs includes roadside signs, overhead signs, kerb mounted signs and median signs along the Project Road. The design for the traffic signs along the Project Road is done as per the design standards indicated in section 11 of Schedule-D.

The height, lateral clearance, location and installation are as per relevant clauses of Schedule 'D'. Overhead sign has been installed ahead of major intersections, toll plazas, start / end of Project Road and urban areas as per detailed design requirements.

Some of the photographs of sign boards are presented below.

Highway Lighting

Highway lighting is provided at underpasses, toll plaza, and built-up locations. High mast lighting is provided at toll plaza location. Highway lighting is also provided at approaches of underpasses.

Some of the photographs of highway lighting are presented below.

Figure 3-11 Photographs of Street Light

km.30+600

km. 79+900

Crash Barriers

Metal beam crash barriers are provided at bridge approaches, locations of high embankment and sharp curves. All the crash barriers provided by the Concessionaire are maintained at site.

Some of the photographs of metal beam crash barriers are presented below.

km. 49+540 (LHS)

km.100+410(LHS)

km. 98+850 (LHS)

km. 53+300 (RHS)

Delineators

816 No. of traffic delineators are provided by Concessionaire for the safety of road users along the Project Road.

Pedestrian Guard Rail

The pedestrian guard rails are provided between service road and main carriageway.

Some of the photographs of pedestrian guard rails are presented below.

Figure 3-13 Photographs of Pedestrian Guard Rail

km.29+900 - Besides Service Road (RHS)

km 92+300 - Besides Service Road (LHS)

Road Land Boundary

Road land boundary pillar is not found / available on Project Road.

3.9 Avenue Plantation and Median Plantation

Avenue plantations is observed at some locations. Median plantation has been provided in the project length as per IRC specification.

The photographs taken during the site visit are presented below.

Figure 3-14 Photographs of Median Plantation

3.10 Toll Plaza

I. Toll Plaza-1 at km. 32+600

The construction of toll plaza is completed and is in operation. 10 (5+5) Nos. of lanes has been constructed and all are under operation. The Concessionaire has constructed administration, operation and maintenance facility at base camp. All required facilities are available at the toll plaza. Some of the photographs of toll plaza-1 are presented below.

Table 3-4 Details of Summary for Toll Plaza Items

Sr. No.	Particulars	Details
1	Toll Plaza Chainage	km. 32+600
2	Number of Tolling Lanes	8 lanes for toll operation plus 2 lanes for over-dimensional vehicles.
3	Weigh in Motion Facility (Number of Lanes)	Yes
4	No. of ETC Lanes	in each direction
5	Number of Toll Booths	9 singles
6	Canopy	Present
7	Administrative Building	Present
8	Parking cum Toilet Block	Present

Sr. No.	Particulars	Details
9	Availability of Tunnel or Elevated Walkway for Movement between Toll Lanes and Administrative Building	Tunnel / no
10	Availability of Static Weigh Bridge	Yes
11	Availability of Loading/Unloading Facility for Overloaded Vehicles	No
12	Storage facility for Overloaded Material	No
13	High mast Light	Yes
14	Streetlight	Yes
15	Low mast Light	No
16	User Fee Boards	6
17	Cantilever/Gantry Boards	Yes
18	Automatic boom barrier	Yes

Figure 3-15 Photographs of Toll Plaza-1

Toll Plaza-1 at km. 32+600

Toll Plaza-1 at km. 32+600

3.10.1 Lane Equipment

Following are the lane hardware and equipment installed at toll plaza.

1. RFID ETC Transceiver
2. Lane Controller with Industrial PC
3. AVC Sensors
4. Automatic Lane Barrier (ALB)
5. Lane Traffic Light and user fare display
6. Incident Capture Camera
7. Overhead Lane Signals
8. Traffic Lights
9. Toll Booth Equipment

3.10.2 RFID ETC Transceiver

RFID ETC Transceiver reads tags installed on the windshield of vehicles and mounted on a pole at about 6 m height. Handheld RFID readers are provided (1 no. in each direction) in case a tag is not detected by the fixed reader.

3.10.3 Lane Controller with Industrial PC

Toll Lane Controller is located within the Electronic Enclosure placed inside each toll booth which is connected to the common server and are capable of independent storage of data.

3.10.4 Automatic Vehicle Classification (AVC) Sensors

The AVC equipment comprises of camera based, axle sensors and inductive loops. The height detector has a high sensing resolution and detects height when object blocks the path. The presence of vehicles is detected by inductive loops. The loop sensors embedded on the pavement trigger the AVC height sensors located on parallel pillars.

AVCC at TP

3.10.5 Automatic Lane Barrier

Boom barriers installed on all lanes are in working condition and have a working time of 0.6 - 0.9 s. Automatic Lane Barrier is used to allow only authorized vehicles to pass through the lane. The barrier is activated only on generation of user fee receipt or other relevant vehicle processing activity. Torque motor powers the barrier for raising and lowering the boom. The motor can be blocked at any position without causing any damage. In the event of power failure, the boom is automatically raised. The boom weight is exactly balanced by built-in springs.

3.10.6 Lane Traffic Light (LTL) and User Fare Display (UFD)

Lane Traffic Light (LTL) is used to instruct vehicles to stop or pass through the lane. The LTL is RED when the toll collector is expecting the vehicle at the booth. After the transaction is done; the LTL turns Green to instruct the vehicle to pass through the lane. The User Fare Display is a part of electronic toll collection equipment located at the toll booth. It is a mini variable message sign (VMS) made of Light Emitting Diodes (LED). The user fare display is used to display the toll fare that is due and that must be paid by the motorist and the classification of vehicle selected by the collector.

LTL at Toll Plaza

3.10.7 Incident Capture Camera (AVC Camera)

The incident capture camera is installed on island of the booth to capture the image of the vehicle from the back side. The AVC triggers the Image capture system.

3.10.8 License Plate Image Capture Camera (LPIC)

License Plate Image capture camera is installed on a 3 m pole facing incoming vehicle to capture the image of the vehicle number plate.

3.10.9 Over Head Lane Signal (OHLS)

The Overhead Lane Signal (OHLS) for lane “Open” and “Close” sign consists of a pair of “GREEN” (arrow) and “RED” (cross) lights. The OHLS is located at the vehicle approaching side of the canopy to show the drivers whether the lane is open or closed.

3.10.10 Toll Booth Equipment

- Toll Booth Hardware / Equipment provided are:
- Toll Collector Display (Operator Monitor)
- Customized Industrial Keyboard
- Receipt Printer
- Intercom Slave unit
- Bar code reader
- Violation Light and alarm
- Manual Booth Control (MBC)
- Booth Camera

The operator monitor termed as Toll Collector Display (TCD) is located on the toll collector's desk. It is the system's interface to the toll collector, to display the status of transactions and status of the lane peripherals.

Thermal printers are installed at the toll booths to print tickets. Intercom slave unit facilitates communication with the master unit located in the control room.

The violation system has an alarm switch which is triggered whenever there is a violation such as run-through happening on the lane. When there is an emergency, a foot switch pressed by the booth operator alerts the control room.

Booth cameras are provided on the inside roof corner of the booth to provide surveillance through CCTV screen located in the control room. Manual Booth Controller is used to release exempt vehicles.

3.10.11 Medium Speed Weigh in Motion (MSWIM)

Medium Speed Weigh in Motion (MSWIM) is installed on entry lanes of Toll Plaza.

3.10.12 Plaza Equipment

TMS Server

Plaza Server is provided in a hot standby configuration and provided with port non-POE network switch and Port PoE switch. Internet connectivity is available through one lease line (Airtel) and Jio Wi-Fi module. Firewalls with Sophos antivirus is provided.

3.10.13 55” LED screen for CCTV monitoring

55” LED screen for CCTV monitoring installed at the toll plaza admin block provides a view of all the toll booths, important zones within the plaza where cash transactions take place (server room, control room, cash up).

The toll plaza manager is able to observe the activities at the toll lanes and toll booth. When the toll collector calls up on the intercom, the manager is able to comprehend the situation at the lane by a zoomed view of the particular lane.

3.10.14 Workstations in Control Room, POS room

Workstations are available in the control room (lane monitoring, administration, and audit), cash room and PoS.

I. Toll Plaza-2 at km. 101+250

The construction of toll plaza is completed and is in operation. 10 (5+5) Nos. of lanes has been constructed and all are under operation. Concessionaire has constructed administration, operation and maintenance facility at base camp. All required facilities are available at the toll plaza. Some of the photographs of toll plaza - 2 are presented below.

Table 3-5 Details of Summary for Toll Plaza Items

Sr. No.	Particulars	Details
1	Toll Plaza Chainage	km. 101+250
2	Number of Tolling Lanes	8 lanes for toll operation plus 2 lanes for over dimensional vehicles.
3	Weigh in Motion Facility (Number of Lanes)	Yes

18	Automatic boom barrier	Yes

Figure 3-16 Photographs of Toll Plaza-2

Lane Equipment

The following are the lane hardware and equipment installed at toll plaza.

1. RFID ETC Transceiver
2. Lane Controller with Industrial PC
3. AVC Sensors
4. Automatic Lane Barrier (ALB)
5. Lane Traffic Light and user fare display
6. Incident Capture Camera
7. Overhead Lane Signals
8. Traffic Lights
9. Toll Booth Equipment

RFID ETC Transceiver

RFID ETC Transceiver reads tags installed on the windshield of vehicles and mounted on a pole at about 6 m height. Handheld RFID readers are provided (1 no. in each direction) in case a tag is not detected by the fixed reader.

Lane Controller with Industrial PC

Toll Lane Controller is located within the Electronic Enclosure placed inside each toll booth which are connected to the common server and are capable of independent storage of data.

Automatic Vehicle Classification (AVC) Sensors

The AVC equipment comprises of camera based, axle sensors and inductive loops. The height detector has a high sensing resolution and detects height when object blocks the path. The presence of vehicle is detected by inductive loop. The loop sensors embedded on the pavement trigger the AVC height sensors located on parallel pillars.

AVCC at Toll Plaza

Automatic Lane Barrier

Boom barriers installed on all lanes are in working condition and have a working time of 0.6 - 0.9 s. Automatic Lane Barrier is used to allow only authorized vehicles to pass through the lane. The barrier is activated only on generation of user fee receipt or other relevant vehicle processing activity. A torque motor powers the barrier for raising and lowering the boom. The motor can be blocked at any position without causing any damage. In the event of power failure, the boom is automatically raised. The boom weight is exactly balanced by built-in springs.

ALB at Toll Plaza

Lane Traffic Light (LTL) and User Fare Display (UFD)

Lane Traffic Light (LTL) is used to instruct vehicles to stop or pass through the lane. The LTL is RED when the toll collector is expecting the vehicle at the booth. After the transaction is done; the LTL turns Green to instruct the vehicle to pass through the lane. The User Fare Display is a part of electronic toll collection equipment located at the toll booth. It is a mini variable message sign (VMS) made of Light Emitting Diodes (LED). The user fare display is used to display the toll fare that is due and that must be paid by the motorist and the classification of vehicle selected by the collector.

LTL at Toll Plaza

Incident Capture Camera (AVC Camera)

The incident capture camera is installed on island of the booth to capture the image of the vehicle from the back side. The AVC triggers the Image capture system.

License Plate Image Capture Camera (LPIC)

License Plate Image capture camera is installed on a 3 m pole facing incoming vehicle to capture the image of the vehicle number plate.

LPIC at Toll Plaza

Over Head Lane Signal (OHLS)

The Overhead Lane Signal (OHLS) for lane “Open” and “Close” sign consists of a pair of “GREEN” (arrow) and “RED” (cross) lights. The OHLS is located at the vehicle approaching side of the canopy to show the drivers whether the lane is open or closed.

OHLS at Toll Plaza

Toll Booth Equipment

- Toll Booth Hardware / Equipment provided are:
- Toll Collector Display (Operator Monitor)
- Customized Industrial Keyboard
- Receipt Printer
- Intercom Slave unit
- Bar code reader
- Violation Light and alarm
- Manual Booth Control (MBC)
- Booth Camera

The operator monitor termed as Toll Collector Display (TCD) is located on the toll collector's desk. It is the system's interface to the toll collector, to display the status of transactions and status of the lane peripherals.

Thermal printers are installed at the toll booths to print tickets. Intercom slave unit facilitates communication with the master unit located in the control room.

The violation system has an alarm switch which is triggered whenever there is a violation such as run-through happening on the lane. When there is an emergency, a foot switch pressed by the booth operator alerts the control room.

Booth Cameras are provided on the inside roof corner of the booth to provide surveillance through CCTV screen located in the control room. Manual Booth Controller is used to release exempt vehicles.

Medium Speed Weigh in Motion (MSWIM)

Medium Speed Weigh in Motion (MSWIM) is installed on entry lanes of Toll Plaza.

Plaza Equipment

TMS Server

Plaza Server is provided in a hot standby configuration and provided with port non-POE network switch and Port PoE switch. Internet connectivity is available through one lease line (Airtel) and Jio Wi-Fi module. Firewalls with Sophos antivirus is provided.

55” LED screen for CCTV monitoring

55” LED screen for CCTV monitoring installed at the toll plaza admin block provides view of all the toll booths, important zones within the plaza where cash transactions take place (server room, control room, cash up).

The toll plaza manager is able to observe the activities at the toll lanes and toll booth. When the toll collector calls up on the intercom, the manager is able to comprehend the situation at the lane by a zoomed view of the particular lane.

Workstations in Control Room, POS room

Workstations are available in the control room (lane monitoring, administration, and audit), cash room and PoS.

3.11 Bus Bays and Passenger Shelters

There are 64 Nos. of bus bays / shelter along Project Road. Some of the photographs of the bus bays are presented below.

Figure 3-17 Photographs of Passenger Shelters

km. 44+830

km. 91+090

3.12 Truck Lay-bye

The truck lay-bye are provided at the following locations on Project Road.

Table 3-6 Details of Truck Lay-bye

Sr. No.	Chainage (km)	Remarks
1	32+150 (LHS)	Good condition. No toilet block.
2	32+500 (RHS)	Good condition. No toilet block.
3	64+500 (LHS)	Good condition. No toilet block.
4	64+600 (RHS)	Good condition. No toilet block.
5	88+240 (LHS)	Good condition. No toilet block.
6	88+540 (RHS)	Good condition. No toilet block.

Some of the photographs of the truck lay bye are presented below.

Figure 3-18 Photographs of Truck Lay Bye

km. 32+500

km. 64+500

3.13 Toilet Block

Toilet blocks are provided at the Toll Plaza locations on the Project Road.

Toilet block at Toll Plaza

3.14 Balance Work Status

The Project Road has received Final Completion Certificate on 23rd June 2012 by completing all the works as mentioned in the Technical Schedules of Concession Agreement. There are no balance works to be executed as per Concession Agreement.

3.15 COS work at Site

At present, NHAI has assigned Change of Scope (COS) works to a third party at four locations along the project corridor. Out of these, underpass and approach construction activities are currently in progress at three locations. Consequently, out of the total project length of 80.273 km, a length of 4.778 km under COS work is not considered within the maintenance scope of the Concessionaire.

3.16 Operation and Maintenance

3.16.1 O&M Contract

As per Clause 15.1 of the Concession Agreement, the Concessionaire shall operate and maintain the Project Road by itself, or through O&M Contractors and if required, modify, repair, improve the Project Road to comply with Specifications and Standards, and other requirements set forth in the Agreement through Good Industry Practice, Applicable Laws and Applicable Permits and manufacturer's guidelines and instructions with respect to toll systems. The Operation and Maintenance activities shall conform to all the requirements laid down in MoRT&H, IRC Specifications and the Concession Agreement.

The Concessionaire has outsourced for carrying out the activities related to operation and maintenance of the Project Road including toll operation services, security services, AMC for TMC and AMC for DG set.

3.16.2 Organization Chart

The Concessionaire has given the Organization Chart at site for Operation and maintenance. Accordingly, there is 01 Project Head, 01 Senior Executive (HR), 01 Assistant Manager (TMS / IT), 01 Executive (TMS / IT), 01 Plaza Manager, 01 Assistant Plaza Manager, 04 Cashiers and 04 validators to carry out O&M activities. The team controls the maintenance activities. However, the maintenance work is undertaken and executed through competent subcontractors.

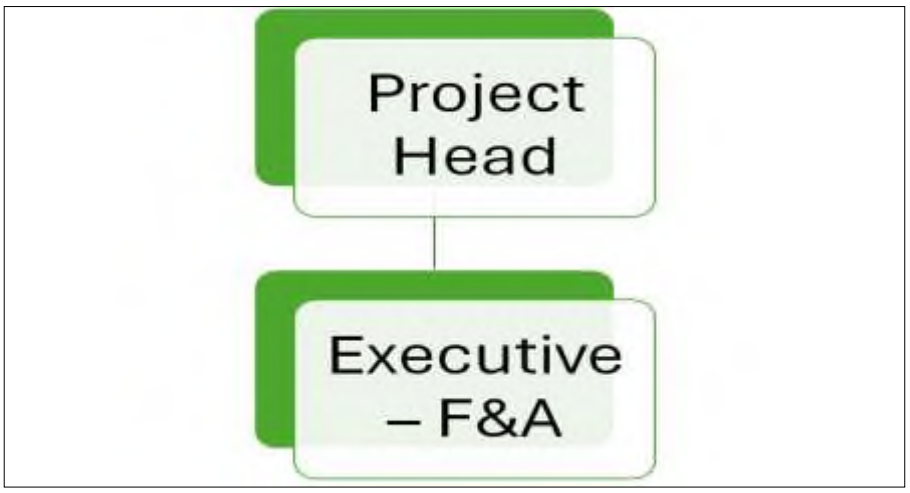
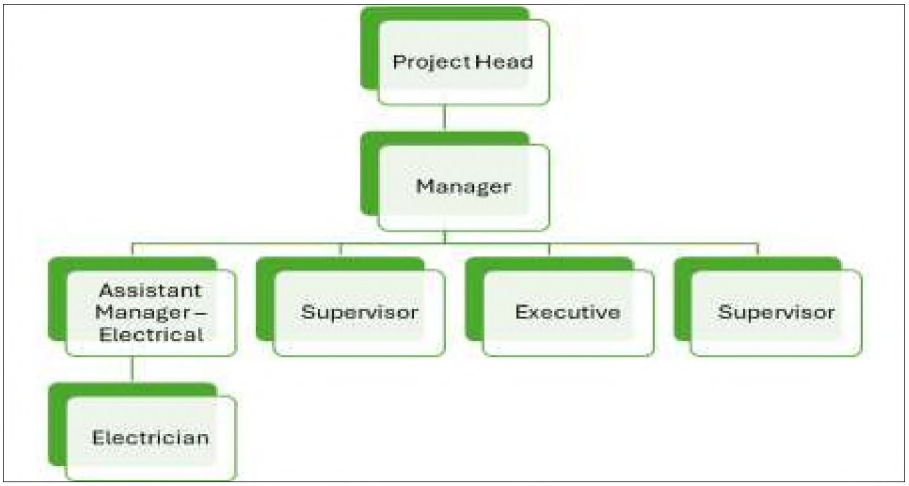
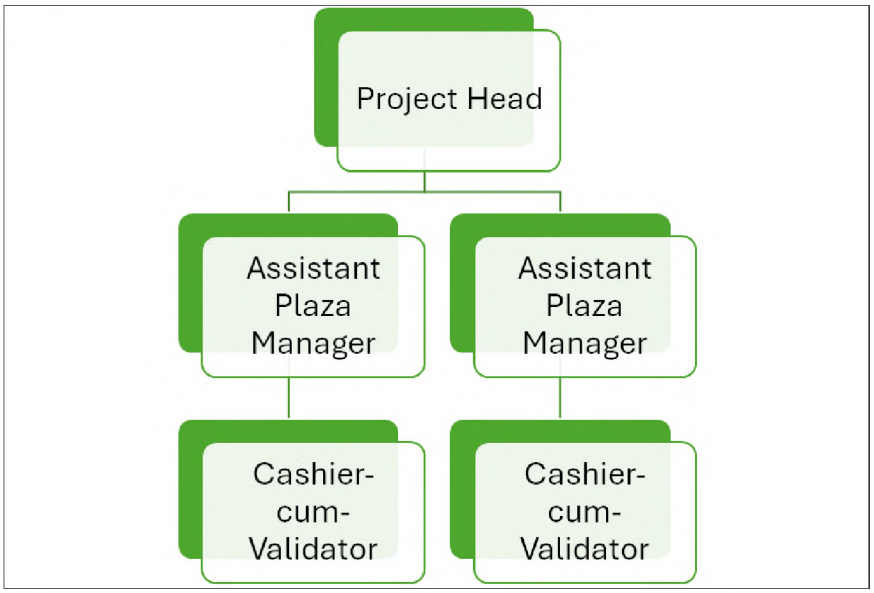
Finance & Accounts



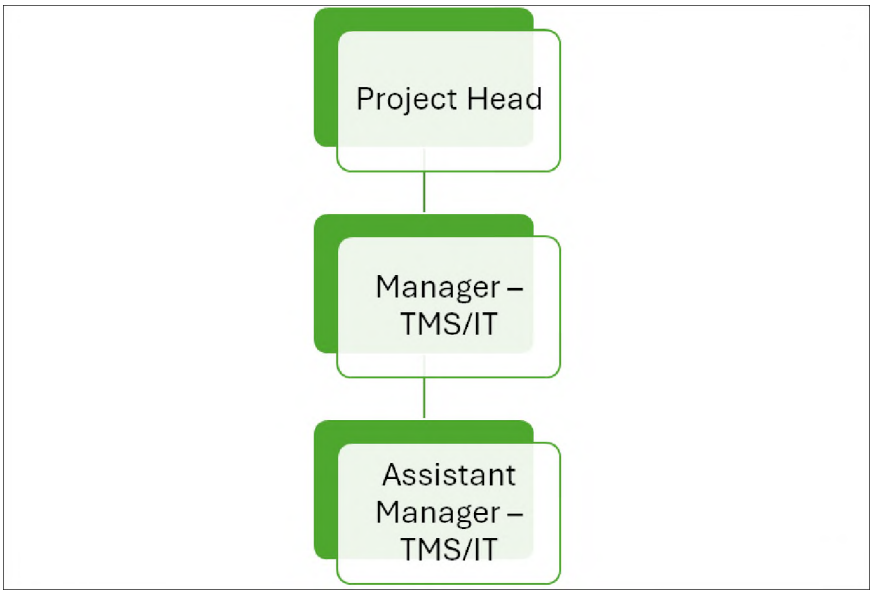
Human Resource

Maintenance





Operation Systems



Traffic & Road study

3.16.3 Operation

Operation cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses, and other miscellaneous expenses. The Concessionaire has provided the expenses occurred towards operation expenses for past years. Necessary assumptions have been made from the expenses of similar types of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area.

The Operation Cost is presented in the subsequent chapter.

3.16.4 Routine Maintenance

The Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey.

Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Maintenance Cost is presented in the subsequent chapter.

4 PAVEMENT INVESTIGATION AND ASSESSMENT

4.1 General

Presently, the pavement of the Project Road is being maintained by the Concessionaire as per Scope of Work. The Concessionaire received the Completion Certificate on 23rd June 2012.

The project is currently under the Operation and Maintenance stage. The concession period of the project is 25 years from the Appointed Date including construction period of 30 months.

4.2 Axle Load and VDF

The Concessionaire has conducted the axle load survey on Project Road at km. 32+500 (near Doddakarenahalli Toll Plaza) and at km. 100+950 (near Karabylu Toll Plaza) from 29-Mar-2021 to 02-Apr-2021. The summary of Vehicle Damage Factor (VDF) calculated as provided by the Concessionaire is tabulated below.

Table 4-1 Vehicle Damage Factor (VDF)

Vehicle Category	Vehicle Damage Factor			
	At TP-1 (km. 32+500)		At TP-2 (km. 100+950)	
	LHS	RHS	LHS	RHS
Bus	1.049	1.036	1.034	1.051
LCV	0.738	1.238	0.874	1.231
2-Axle	2.533	4.52	3.281	3.133
3-Axle	4.932	15.218	7.076	8.977
MAV	7.471	11.848	15.92	18.081

4.3 Design Traffic

Traffic in Million Standard Axles (MSA) for the homogeneous section based on the historical traffic data provided by the Concessionaire, current traffic has been used for future projections and the estimated design MSA is computed and presented in subsequent table.

For the estimation of design MSA, Actual Traffic Growth Rates as provided by the Concessionaire were used.

Table 4-2 MSA Calculation

MSA Calculation At TP-01					
Year	MSA (LHS)	Cumulative MSA (LHS)	MSA (RHS)	Cumulative MSA (RHS)	Remarks
2024-25	1.72	**1.72**	3.11	**3.11**	
2025-26	1.81	**3.53**	3.11	**6.22**	
2026-27	1.85	**5.38**	3.17	**9.39**	
2027-28	1.89	**7.27**	3.22	**12.61**	
2028-29	1.95	**9.22**	3.33	**15.94**	
2029-30	2.02	**11.24**	3.43	**19.37**	
2030-31	2.09	**13.33**	3.54	**22.91**	
2031-32	2.16	**15.49**	3.65	**26.56**	

MSA Calculation At TP-01					
Year	**MSA (LHS)**	**Cumulative MSA (LHS)**	**MSA (RHS)**	**Cumulative MSA (RHS)**	**Remarks**
2032-33	2.23	**17.72**	3.77	**30.33**	**End of Concession Period**

MSA Calculations at TP-02					
Year	**MSA (LHS)**	**Cumulative MSA (LHS)**	**MSA (RHS)**	**Cumulative MSA (RHS)**	**Remarks**
2024-25	2.55	**2.55**	2.90	**2.90**	
2025-26	2.70	**5.25**	3.05	**5.95**	
2026-27	2.81	**8.06**	3.17	**9.12**	
2027-28	2.91	**10.97**	3.29	**12.41**	
2028-29	3.02	**13.99**	3.40	**15.81**	
2029-30	3.13	**17.12**	3.53	**19.34**	
2030-31	3.24	**20.36**	3.65	**22.99**	
2031-32	3.35	**23.71**	3.78	**26.77**	
2032-33	3.48	**27.19**	3.91	**30.68**	**End of Concession Period**

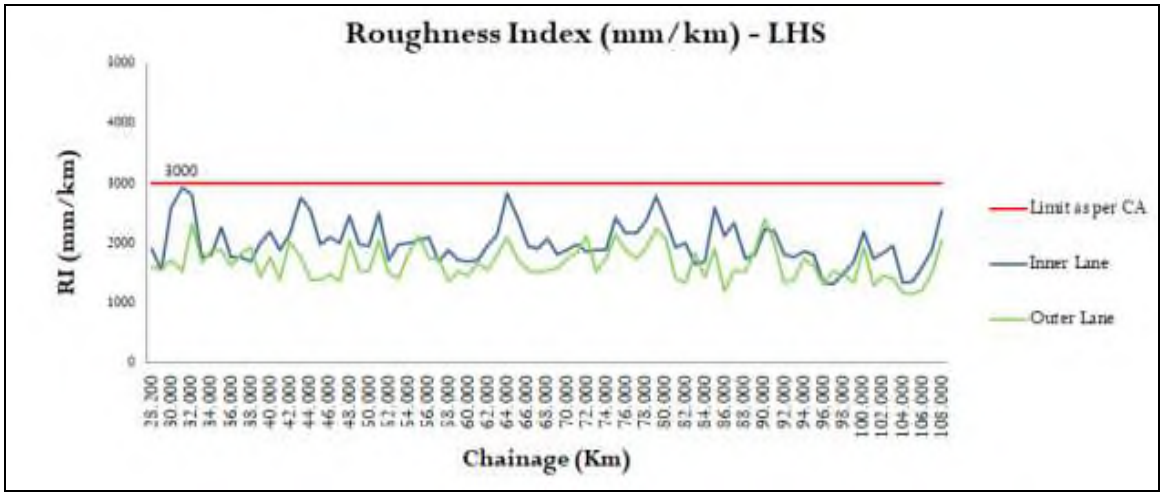
4.4 Network Survey Vehicles (NSV) Survey

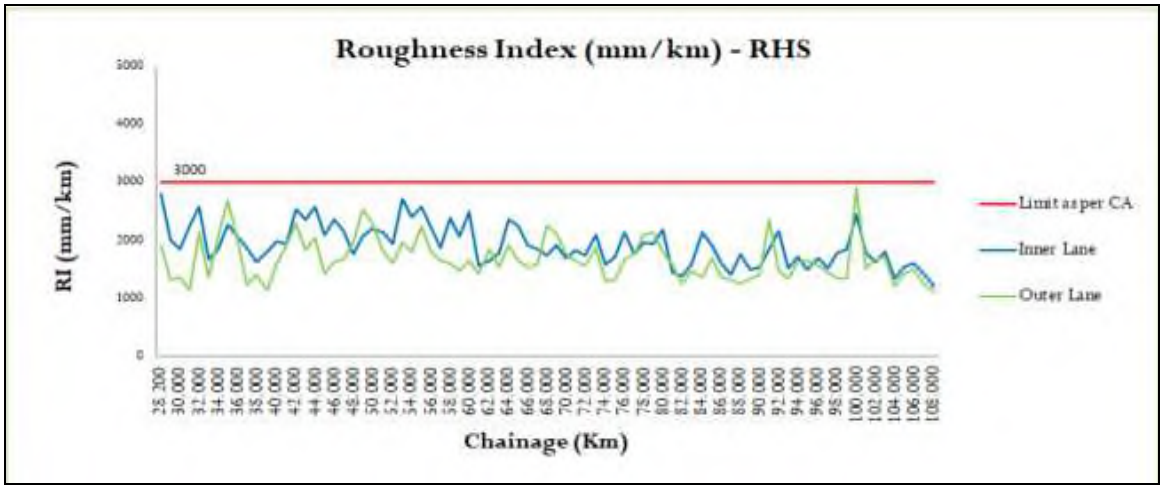
The Concessionaire has provided NSV survey data conducted in November 2024. The NSV data is used to assess the riding quality and pavement condition of Project Road. The summary of classification of pavement as per Schedule-L is given in the table below:

Table 4-3 Summary of NSV Survey

Riding Condition	Roughness Index (mm/km)	Length (km)			
		LHS		RHS	
		Inner	Outer	Inner	Outer
Good	<2000	46.80	68.80	50.40	65.20
Fair	2000-3000	33.40	11.40	29.80	15.00
Poor	>3000	0.00	0.00	0.00	0.00

From the above table it is observed that the overall condition of pavement is Good to Fair.





4.5 Structural Investigations

An evaluation of existing pavement using Falling Weight Deflectometer (FWD) survey was carried out from 10-Oct-2024 to 13-Oct-2024. Summary of FWD Survey report is presented in the table below:

Table 4-4 Summary of FWD Survey

Description	Length (km)			
	LHS		RHS	
	Inner Lane	Outer Lane	Inner Lane	Outer Lane
Less than 10 MSA	-	-	-	-
10-50 MSA	20.00	24.00	35.00	35.85
Above 50 MSA	61.47	57.47	46.47	48.62
Total Length Tested	**81.47**	**81.47**	**81.47**	**81.47**

From the above table, it is concluded that the residual life of the pavement is more than the design life of the Project Road. Hence, immediate major maintenance of the pavement is not required.

The strengthening/ overlay of pavement for Project Road are derived from 15th percentile of corrected E moduli of existing pavement, existing crust thickness etc. The combination of existing pavement and overlay will be analyzed as a four-layer system to ensure that fatigue and rutting criteria are satisfied for the calculated design traffic in terms of MSA. IITPAVE program is used to compute strain value at bottom of bituminous layer and top of subgrade in order to calculate design life of the proposed overlay. Poisson's ratio values used in overlay analysis from top to bottom of existing pavement layers are 0.5, 0.4 and 0.4 for existing bituminous, existing granular and existing subgrade layers respectively. Elastic modulus of 3000 MPa (VG-40) is used for the new bituminous layer.

4.6 Test pit and Subgrade Investigation

The Concessionaire has carried out the subgrade investigation for Project Road. The results of the same as provided by the Concessionaire are tabulated as below:

Table 4-5 Test Results Summary of Natural Ground Soil Samples

Sr. No.	Existing Road	Location (km)	Side (LHS/RHS)	Soil Classification as per IS: 1498	Gradation: Percent by weight passing through the Sieve (IS:2720-IV)						Clay & silt content %	Atterberg Limits [IS :2720-Pt-V]			Modified Proctor Test (IS:2720-Pt-VIII)		Field Density		4-Days Soaked CBR (%)	Free Swell Index (%)	Degree of Compaction (%)

4.7 Periodic Maintenance Strategy

Major Maintenance is required in order to comply requirement of Concession Agreement and to maintain performance level as defined in Schedule-L. As per schedule-L of Concession Agreement, periodic maintenance shall be carried out at least once every 5th year from COD and in the last year of concession period.

It is noted that Concessionaire has carried major maintenance in Year 2022-23. The table below shows the major / periodic maintenance cycle throughout the balance concession period for the Project Road. As per Concession Agreement, periodic maintenance shall be carried out in the last year of concession period. Hence, major maintenance is proposed in FY 2033 for the entire length. Before carrying out major maintenance, structural evaluation shall be done through surveys and investigation to determine the overlay requirement.

Table 4-8 Major Maintenance Cycle

Sr. No.	Year	Main Carriageway	Service Road	Cart Track
1	FY 2026 to FY 2027	-	-	-
2	FY 2028	30 mm BC (PMB) overlay in 50%, 50 mm DBM (VG-40) in 5% and Micro-surfacing in 50% length	30 mm BC overlay in 50% and Micro-surfacing in 50% length	30 mm BC overlay in 50% and Micro-surfacing in 50% length
3	FY 2029 to FY 2032	-	-	-
3	FY 2033	30mm BC (VG-40) overlay in 100% length, 50 mm DBM (VG-40) in 5%	30 mm BC overlay in 50% and Micro-surfacing in 50% length	30 mm BC overlay in 50% and Micro-surfacing in 50% length

The projected cost for periodic / major maintenance is presented in the subsequent chapter.

5 COST ESTIMATES

5.1 General

Based on the assessment carried out in previous chapters, various costs were worked out. The costs are divided into following categories.

I. Balance Work Cost
II. Routine O&M Cost
III. Major Maintenance Cost
IV. Periodic Replacement of TMS / system

Costs for different category are detailed out in subsequent sections along with the assumptions considered for rate and escalation.

5.2 Rate Assumption

Following assumptions are considered for unit rates of various items while estimating the cost:

1. Unit rates of different items (BC, DBM, Concrete, Road markings etc.) are calculated as per the MoRTH Standard Data Book 2019. The input rates for MoRTH standard data book were adopted as below:

   a. **Manpower and labour:** As per applicable minimum wages published by Ministry of Labour & Employment, Government of India.

   b. **Bitumen:** Concessionaire has long term contract with IOCL for the procurement of bitumen and related products. Same discounts are considered on bitumen procurement for this analysis. Furthermore, we also understand that bitumen prices are primarily dependent on crude oil price and market demand and hence are likely to be very volatile and difficult to predict at this stage.

      Therefore, bitumen prices are considered as per the forecast of Client. Current published of bitumen are considered for unit rates calculation for FY 2027. Average 10 years of price of bitumen are considered for unit rates calculation for FY 2028 and onwards.

      Polymer and modification cost are provided by the Client to workout BC rate with PMB.

      Following rates of bitumen are considered.

Table 5-1 Bitumen Rates - Ex-MI Supply excluding discount and GST

Sr. No.	Supply Location	Applicability of Rates	Product	Rate for 2027 (Rs. / MT)	Rate for 2028 onwards (Rs. / MT)
1	Mathura	All States	VG10	45,102	35,125
2			VG30	46,402	36,137
3			VG40	48,962	38,131
4	Panipat	All States	VG10	45,102	35,125
5			VG30	46,402	36,137
6			VG40	48,962	38,131
7	Koyali	All States	VG10	47,102	37,125

Sr. No.	Supply Location	Applicability of Rates	Product	Rate for 2027 (Rs. / MT)	Rate for 2028 onwards (Rs. / MT)
8			VG30	48,402	38,137
9			VG40	51,082	40,251
10	Haldia	All States	VG10	46,602	35,683
11			VG30	47,402	36,295
12			VG40	49,962	38,256
13	Barauni	All States	VG10	47,132	36,213
14			VG30	48,432	37,325
15			VG40	50,992	39,286
16	CPCL	Kerala	VG10	47,402	35,519
17			VG30	48,402	36,395
18			VG40	50,762	38,120
19	CPCL	Tamil Nadu	VG10	47,902	36,019
20			VG30	48,402	36,395
21			VG40	50,962	38,320
22	CPCL	Telangana and Andhra Pradesh	VG10	44,602	32,719
23			VG30	45,402	33,395
24			VG40	47,962	35,320
25	CPCL	Karnataka	VG10	44,602	32,719
26			VG30	45,402	33,395
27			VG40	47,962	35,320

c. Sand and Aggregate: Market rates are considered from the quarry located nearest to Project Road.

d. Cement: Market rates are considered from the nearest local market.

e. Steel : Rate of steel is taken Tata Tiscon website.

f. Machinery Hire charges: Hire charges for the machinery are considered in accordance with applicable PWD SOR.

g. Actual Rates of items as per work order: The rates of road stud, kerb raising, micro surfacing, milling, aggregate rates etc. are considered as per the work order shared by the client.

2. Goods and Service Tax (GST) is considered as 18% as per the latest Government Guidelines.

Summary of Unit Rates worked out using Standard Data Book adopted for major items is given below.

Table 5-2 Summary of Unit Rates

Sr. No.	Item Description	Unit	Rates (Rs.) (FY 26 onwards)
1	Dense Bituminous Macadam (VG-40)	Cum	10,175
2	Bituminous Concrete (PMB)	Cum	13,386
3	Bituminous Concrete (VG-40)	Cum	11,598
4	Bituminous Concrete (VG-30)	Cum	11,276
5	Milling	Sqm	95

Sr. No.	Item Description	Unit	Rates (Rs.) (FY 26 onwards)
6	Micro-surfacing	Sqm	180
7	Kerb Re-laying	Rmt	310
8	Road Marking	Sqm	557
9	Road Studs	Nos.	255

5.3 Balance Work Cost

As discussed in the previous chapter, there are no balance works to be executed as per CA. Hence, balance work cost is **NIL**.

5.4 Routine O&M Cost

Routine O&M cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses, horticulture and ROW maintenance, routine maintenance, and other miscellaneous expenses. The Concessionaire has provided the major agreements towards operation and maintenance for past years. Necessary assumptions have made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area. Same has been divided into following major heads:

1. Salary and Welfare Expenses
2. Tolling Operations Services
3. Incident Management Services
4. Electricity and Diesel Charges
5. TMS / System Expenses
6. Office Operating Expenses
7. Vehicle Running Expenses
8. Professional Fees Expense
9. Insurance Expense
10. IE Fees
11. Horticulture & ROW Maintenance
12. Routine Maintenance Cost

In above, the Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey. Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Operation Cost is presented as below. The detailed working of routine maintenance (Sr. No. 15 of below table) is presented in **Annexure-I**.

Table 5-3 Summary of Operation Cost

Sr. No.	Particulars	Amount from FY 2027 to FY 2033
1	Salary and Welfare Expenses	2,07,00,000
2	Tolling Operations Services	4,88,86,746
3	Toll Security Services	93,80,377
4	Incident Management & Emergency Services	2,94,06,739
5	Electricity and Diesel Charges	1,09,96,854
6	TMS/System Expenses	32,00,750
7	Office Operating Expenses	23,17,883
8	Vehicle Running Expenses	44,40,000
9	Professional Fees Expenses	83,90,736
10	Community Development	12,98,014
11	Communication Expenses	7,41,723
12	Conveyance Expenses	4,17,219
13	Insurance Expenses	92,55,487
14	IE Fees	92,71,532
15	Routine Maintenance Cost (Project Highway)	4,72,23,141
16	Horticulture & ROW Maintenance	3,31,31,280
17	Miscellaneous including Contingency	47,61,122
	Total Cost (Rs)	**24,38,19,602**
	Total Cost (Cr)	24.38
	Per km Cost (Lakh)	**30.37**

5.5 Major Maintenance Cost

The summary of Major Maintenance Cost is provided as below. The detailed working of the same is presented in **Annexure-II**.

Sr. No.	Year	Major Maintenance Cost (Cr.)	Remarks
1	FY 2028	91.85	
2	FY 2033	103.76	
Total Cost (Cr.)		**195.60**	

5.6 Periodic Replacement of TMS / System

Every 7 years, replacement of cost of major TMS / system is considered. The same is provided as below.

Sr. No.	Year	TMS O&M / Replacement Cost (Cr.)	Remarks
1	FY 2030	1.29	
Total Cost (Cr.)		**1.29**	

5.7 Escalation Assumption

Following escalation has been considered for the O&M cost as provided by Client.

Table 5-4 Escalation

Year	Escalation	Year	Escalation
2027	-	**2042**	3.99%
2028	5.25%	**2043**	3.99%
2029	4.86%	**2044**	3.99%

Year	Escalation	Year	Escalation
2030	4.44%	**2045**	3.99%
2031	4.24%	**2046**	3.99%
2032	4.13%	**2047**	3.99%
2033	4.08%	**2048**	3.99%
2034	4.01%	**2049**	3.99%
2035	4.00%	**2050**	3.99%
2036	4.03%	**2051**	3.99%
2037	4.01%	**2052**	3.99%
2038	3.98%	**2053**	3.99%
2039	3.98%	**2054**	3.99%
2040	4.00%	**2055**	3.99%
2041	3.99%	**2056**	3.99%

5.8 Summary of Cost

Different O&M cost have been worked out based on the investigations and assessment on Project Road. Cost for each of the category has already discussed in previous sections. Since the forecasting has been carried out for remaining concession period, the cost is summarised yearly for remaining concession period along with escalation as mentioned in clause 5.7.

Escalated O&M Cost (in INR Cr.)

Sr. No.	Year of expense	FY27	FY28	FY29	FY30	FY31	FY32	FY33
1	Routine O&M Cost							
1.01	Salary and Welfare Expense	2.07	2.18	2.30	2.41	2.52	2.62	2.73
1.02	Tolling Operations Services	4.89	5.16	5.43	5.69	5.95	6.20	6.45
1.03	Toll Security Services	0.94	0.99	1.04	1.09	1.14	1.19	1.24
1.04	Incident Management Services	2.94	3.10	3.27	3.42	3.58	3.73	3.88

4	Balance Works Cost	-	-	-	-	-	-	-
	Total Cost	**24.43**	**121.47**	**27.13**	**29.95**	**29.71**	**30.97**	**158.00**

ANNEXURES

ANNEXURE I - ROUTINE MAINTENANCE COST

Routine Maintenance Cost	
Ordinary Repair Cost for Flexible (with GST)	**4,72,23,141**
(Inclusive of GST)	= 5.88 lakhs per km

CONVERSION FACTORS										
National Highways / State Highways										
Reference cost taken for Two / four lane (7.0 or 14m or 21m) with 1.5m wide shoulders										
(Refer Chapter 6.17 of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 45)										
Sr. No.	**Description for Flexible Pavement**		**Factor**	**Normal** More than 4500 CVD **3,07,600**	**Urban** More than 4500 CVD **3,46,710**	**Hilly** More than 4500 CVD **3,51,804**	**Project Length (km)**		**Per Year Project Maintenance Cost**	
							Normal	**Urban**	**Normal**	**Urban**
1	Four-lane with divided carriageway	Without paved shoulder	1.53	470628.00	530466.00	538260.00	-	-	-	-
		Paved shoulder	1.70	522920.00	589407.00	598067.00	58.40	-	3,05,36,959	-
2	Four-lane with divided carriageway and service lane on either side	Without paved shoulder	2.00	615200.00	693420.00	703608.00	-	-	-	-
		Paved shoulder	2.20	676721.00	762762.00	773969.00	-	21.88	-	1,66,86,182
						TOTAL		**80.273**		**4,72,23,141**

Ordinary Repairs

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity**
				More than 4500 CVD
				BT Surface
1	**2**	**3**	**4**	**5**
1	**Maintenance of Carriageway & Paved Shoulders (1.5m wide); B.T. Surface**			
	i) Pot holes repair (50 mm deep)	100 % Pot hole free	As & when required	1.00%
	Volume (cum)			5.00
	Rs/m^3			11830
	Cost in Rupees			59,148
	ii) Patch repair	100 % Patch less	As & when required	1.50%
	Area (sqm)			150
	Rs/m^2			473
	Cost in Rupees			70,977
	iii) Sealing (Crack)			
	a) Wider than 3 mm	100 % Crack Less	As & when required	2.00%
	Area (sqm)			200
	Rs/m^2			70
	Cost in Rupees			13,924
	b) Width less than 3 mm	75 % Crack Less	As & when required	2.00%
	Area (sqm)			150
	Rs/m^2			46
	Cost in Rupees			6,967
	iv) Repair of ruts and undulations			
	a) Greater than 20 mm	75%	As & when required	2.00%
	Area (sqm)			150
	Rs/m^2			473
	Cost in Rupees			70,977
	v) Road marking	14%	Once in 7th year & @	10558

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)

1	**2**	**3**	**4**	**5**
			Repaired location	
	SUB TOTAL			**2,32,551**
2	**Maintenance of earthen Shoulders:**			
	i) Renewal of earthen shoulders	80%	Once in a Year	6322
	ii) Jungle Clearance	100%	Twice in a Year	2074
	iii) Kuccha Drain Maintenance	100%	Twice in a Year	1111
	SUB TOTAL			**9,507**
3	**Maintenance of Cross Drainage works:**			
	i) Cleaning of culvert bed	100%	Once in a Year	2800
	ii) Repair of floors	100%	Once in a Year	5067
	iii) Repair of parapets	100%	As & when required	2111
	SUB TOTAL			**9,978**
4	**Maintenance of Minor & Major Bridges:**			
	i) Cleaning and removal of dirt & vegetation from pier caps, Bearings, Expansion Joints, Superstructure, Substructure and Retaining wall etc.	100%	As & when required	37,043
	ii) Spot painting & protective Coating required on Bearing and greasing of Bearings, railing, structural members, Expansion joints			
	iii) Repair of minor washouts, erosion scour and animal holes			
	iv) Sealing Cracks with Cement/ Epoxy Mortar			
	v) Replacement & Correction of safety barriers, Guard rails and damaged members			
	SUB TOTAL			**37,043**
5	**Miscellaneous Items:**			
	i) Turfing and Arboriculture		Once in a Year	2470
	ii) Maintenance of gang hut store, sheds, animal & debris removal		Once in a Year	3704
	iii) Lettering, Painting of Km stones & kerbs, sign boards,		Once in a Year	3704

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)

1 INTRODUCTION

1.1 Background

Cube Highways Fund Advisors Pvt. Ltd. (hereinafter referred as "the Client") is the Investment Manager of the Cube Highways Trust ("Trust" or "InvIT"). The Trust is registered with Securities and Exchange Board of India ("SEBI") as an Infrastructure Investment Trust under the SEBI InVIT Regulations. Cube Highways Fund Advisors Pvt. Ltd. has appointed **M/s. FP Project Management Consultancy Services Private Limited** (hereinafter referred as "Technical Consultant" or "FPPM") to carry out Technical Due Diligence of Nanguneri to Kanyakumari Section of NH-44 from km. 180+000 to km. 243+470 in the State of Tamil Nadu (hereinafter referred as "Project Road").

Nanguneri Kanyakumari Tollway Private Limited (hereinafter referred as "Concessionaire") is a special purpose vehicle (SPV) for tolling, operation, maintenance, and transfer of Nanguneri to Kanyakumari Section (km. 180+000 to km. 243+470) of NH-44 or Project Road under TOT Bundle-3. The project was awarded to Concessionaire on 20th October 2020. The length of Project Road is 63.47 kms with one toll plaza at Nanguneri Village at km. 185+860.

Accordingly, Technical Consultant has undertaken the work of assessment of operation and maintenance (O&M) cost based on site inspections and filed investigations. The same is presented in this report.

1.2 Scope of Work

The detailed scope of work for conducting the technical due diligence of Project Road is presented as below:

- A reconnaissance of the Project Road to understand the current condition of the pavement, structures, road furniture, toll plaza and other highway assets
- Review and assessment of important technical documents like CA, pavement design report, O&M report, DPR, As-built drawings, O&M manual, COD / PCOD certificate, punch list, previous major maintenance etc.
- Review of recent pavement investigations and surveys conducted on Project Road like FWD, NSV, aaxle load, material investigations etc.
- Formulation of future major maintenance strategy
- Estimation of any initial expenses to be incurred due to deficiencies observed in diligence
- Estimation of Routine Maintenance and Major Maintenance forecast for remaining concession period
- Estimation of Annual Operation expenses along with Systems cost (TMS / HTMS) till the end of concession period
- Review of balance work cost for Project Road including estimation of quantities and item rates

1.3 Our Approach Philosophy

1.3.1 Composition of Team

Our team consists of well-qualified engineers and other professionals, whose experience covers all the skills and specializations required for undertaking such assignments. All the team personnel proposed are our regular employees and have a long and stable working relationship with our firm.

The Team Leader coordinates the activities between all the key staff who work closely together. The key staff is assisted by various support staff, who report to the respective key staff in their field of expertise. The Team Leader is the point of contact for Client on Technical Study.

The technical study includes review of all the available documents namely:

a) Concession Agreement including Technical Schedules
b) O&M Contract, work order and their provisions
c) Quality of construction based on available data, design and drawings
d) Documents on historical expenditure on operation and maintenance
e) O&M cost schedule for the concession period
f) Review of Completion / Provisional Completion along with punch list items
g) Review of recent pavement surveys conducted
h) Correspondence regarding scope of works and during O&M
i) Recent O&M Report submitted to Authority
j) Toll operation manual / ATMS related documents

The review of above documents is the first step towards accomplishment of the task. This gives a complete idea of the project and is used as input data for preparation of report after necessary analysis.

1.3.2 Site Visit and Data Collection

A team of experts from various streams has carried out the preliminary site visit to understand the assessment of project assets mainly condition of the pavement and structures.

- The site visit is undertaken for detailed reconnaissance and visual pavement condition assessment.
- The condition assessment of major structures by visual inspection
- The information like material sources and the probable cost is collected for the purpose of cost estimate.

The detailed design / drawings viz. Plan & L-sections, drainage design, structure design, layout drawings for project facilities like toll plaza, bus bay, truck lay-byes, highway lighting facilities etc. are studied. Also, design / drawing and provision pertaining to road furniture are studied.

The information on availability of material in the vicinity is gathered. It has direct impact on cost of maintenance work and balance work.

The basic approach for preparation of cost estimates for operation and maintenance is as per the practice of State PWD / MORT&H in respect of highways and structures.

1.3.3 Data Analysis

Based on the study of the available information and preliminary site visits, the consultants share their preliminary observations with the Client based on the evaluation of the technical data and reports provided by the Client.

1.4 Structure of the Report

This report has been prepared based on the information, reports and documents made available to us by the Company. We have also referred to publicly available reports, literature etc. and have made our best efforts to check the authenticity of the information available, analyzing the same as per the best engineering / industry practices.

The site visit and inspection were carried out from **18th March 2026 to 19th March 2026**.

The report is organized with the following chapters for easy understanding of various issues.

Chapter 1 **Introduction:** The chapter gives an overview of the project background, detailed scope of work, approach, and methodology for due diligence studies.

Chapter 2 **Project Description:** The chapter describes existing project features, overview of project development.

Chapter 3 **Condition Assessment of Project Road:** The chapter presents the details and condition of various essential features of the Project Road based on site visit.

Chapter 4 **Pavement Investigation and Assessment:** The chapter describes the summary of pavement surveys and investigations carried out on Project Road along with the requirement of pavement maintenance.

Chapter 5 **Cost Estimates**: The chapter summarizes the forecasting of O&M and major maintenance cost over the remaining concession period.

2 PROJECT DESCRIPTION

2.1 Introduction

National Highways Authority of India signed the Concession Agreement with **Nanguneri Kanyakumari Tollway Private Limited**, is a company promoted by Cube Highways or a Special Purpose Vehicle (SPV) formed for implementing this project on 27th December 2019. The Appointed Date for the Project Road is 20th October 2020.

The project is being developed under TOT (Toll Operate Transfer) Bundle-3 with concession period of 30 years from the Appointed Date. The end of the concession period is in the year 2050.

2.2 Location

The Project Road is part of National Highway No. 44 (old NH-7) of Madurai-Kanyakumari section in the State of Tamil Nadu. The total project length is 63.47 kms.

The Location Map of the Project Road is presented below:

Figure 2-1 Location Map

The photographs taken during the site visit are presented below.

Figure 2-2 Start and End of Project Road

Start of the Project Road

End of the Project Road

2.3 Climate

The project being in the region southeast of the western ghats, the area is hot and dry. Temperatures range between a maximum of 37 °C and a minimum of 22 °C. April to June are the hottest months and December and January are the coldest with temperatures rising towards the end of February. Rainfall occurs mostly during the north-east monsoon in the months of October to December. However, the project stretch receives little rainfall, averaging 840 mm. Annual rainfall has ranged from 964 mm to 228 mm during past decades.

2.4 Terrain

This section of National Highway traverses through plain terrain.

2.5 Abutting Land Use

The land use along the Project Road is predominantly agriculture or barren with intermittent built-up area.

2.6 Right of Way

The width of existing Right of Way (RoW) throughout the project stretch is 60.0 m.

2.7 Existing Utilities

During widening of the Project Road, various affected utility services were shifted to proposed ROW. The different types of utilities found along the road include, electrical poles, telephone poles, OFC Cables, etc.

2.8 Development as per Schedule-B

The Project Road from Nanguneri village (km. 180+000) to Kanyakumari (km. 243+470) has been developed as a four-lane divided carriageway with a median width of 2 m, service road and other arrangements. The Project Road passes through rural as well as built-up sections.

Following is the Scope of Work as per Schedule-B of Concession Agreement.

Table 2-1 Details of Scope of Work

Sr. No.	Type of Structure	Unit	Scope	Remark
1	O&M of Main Carriageway	Km.	63.47	
2	Construction of Service Road	Km.	2.74	(LHS+RHS)
3	Reconstruction of Pipe Culvert	Nos.	03	
4	Widening of existing Pipe Culvert	Nos.	02	
5	Widening of existing Slab Culvert	Nos.	01	
6	Repair & rehabilitation of Major Bridges	Nos.	02	
7	Repair & rehabilitation of Minor Bridges	Nos.	31	
8	Repair & rehabilitation of Box Culvert	Nos.	44	
9	Repair & rehabilitation of Pipe Culvert	Nos.	104	
10	Repair & rehabilitation of ROB	Nos.	02	
11	Repair & rehabilitation Vehicular Underpass (VUP)	Nos.	06	
12	Improvement of Major Junction	Nos.	05	
13	Improvement of Minor Junction	Nos.	15	
14	Provision of Drain	km	2.74	(LHS+RHS)

3 CONDITION ASSESSMENT OF PROJECT ROAD

3.1 Pavement

The Project Road is four lane divided carriageway and generally has paved carriageway of 9.0 m with earthen shoulder of 1.5 m on either side. The Project Road has a median width of 2.0 m throughout its length.

The entire stretch of Project Road including service road is constructed with flexible pavement. The pavement type for the Toll Plaza including taper is of rigid pavement.

3.1.1 Pavement Condition Survey

The pavement condition survey was carried out from **18th March 2026 to 19th March 2026.** through visual inspection for the entire project length. From the visual inspection, it is found that the pavement condition of the Project Road is found to be Good.

Some of the photographs taken during the site visit are presented as below.

Figure 3-1 Photographs of Pavement Condition (MCW)

km. 181+950

km. 183+410

km. 243+100

km. 195+590

km. 197+270

km. 241+380

3.2 Service Road / Slip Road

The service road with width varies from 5.5 m to 7.0 m and is constructed in built-up area and adjoining underpass locations. The Project Road has total service road length of 62.28 kms. The photographs taken during the site visit are presented below.

Figure 3-2 Photographs of Service Road

km. 182+000

km. 200+990

3.3 Major / Minor Junctions

There are 12 nos. of major junctions and 50 nos. of minor junctions along Project Road.

The photographs taken during site visit is presented as below:

Figure 3-3 Photographs of Junctions

Junction at km. 221+800

Junction at km. 181+950

3.4 Condition Survey of Bridge

The inventory of structures including major bridges, minor bridges, ROB's, underpasses and culverts is presented in table as below:

Table 3-1 Details of Summary for Structures

Type of Structure	Total Number of Structures
Major Structures:	
Major Bridges (MJB)	02
Minor Bridges (MNB)	31
Slab Culverts / Box Culverts	44
Pipe Culverts	104
Road over Bridges (ROB)	02
Vehicle / Cattle Underpass	06
Total	**189**

The detailed condition survey of structures was carried out by visual inspection. The observations and findings are presented in table below:

Table 3-2 Condition Survey of Major Structure

3.5 Condition Survey of Culverts

The cross-drainage structure includes hume pipe culverts and box culverts at various locations. There are 104 Nos. of pipe culverts and 44 Nos. of box culverts along the Project Road. The height of culvert varies from 1.0 m to 3.0 m from bed level. During the condition survey of structure, these culverts were inspected on sample basis.

The project involves strengthening and widening of existing road to four lane divided carriageway. The culverts beneath existing alignment are either widened or reconstructed. The structural condition of culverts is generally found in sound condition. The quality of surface concrete of box culverts is satisfactory. The RCC parapet, crash barrier or RCC railing has been provided at culvert locations which is maintained properly.

In most of culverts, the waterway is clear. However, near to urban area and some location is found blocked due to debris, drainage water or bushes, tree growth, The cement concrete pitching or stone pitching has been provided for slope protection.

The photographs taken during site visit are presented below.

Figure 3-5 Photographs of Culverts

Pipe culvert at km. 181+950

Box culvert at km. 187+350

3.6 Drainage

A total length of 4.51 kms of pucca / concrete drain (which includes drain on both sides) is constructed along the Project Road. The photographs taken during site visit is presented as below.

Figure 3-6 Photograph of RCC Drain

km. 181+600

km. 201+500

3.7 Slope Protection

Slope protection and chute drains are found on Project Road at required locations.

3.8 Road Furniture

The Concessionaire has provided additional road furniture along the Project Road as per the standards and specifications mentioned in Schedule-C. Details of the items are provided below.

Pavement Marking

Pavement marking for the Project Road is done as per the design standards indicated in section 12 of Schedule-D. Some of the photographs of road marking are presented below.

Figure 3-7 Photographs of Pavement Marking

km. 182+330

km. 192+820

km. 181+950

km. 238+981

Road Studs

Road stud / cat's eye for the project Road is done as per the design standards indicated in section 12 of Schedule-D. Road studs / cat's eye has been fixed at junction and zebra crossings. Some of the photographs of road studs are presented below.

Figure 3-8 Photographs of Road Studs

km. 181+200

km. 221+800

Traffic Signage / Median Kerb painting / KM Stone

Traffic signs includes roadside signs, overhead signs, kerb mounted signs and median signs along the Project Road. The design for the traffic signs along the Project Road is done as per the design standards indicated in section 11 of Schedule-D.

The height, lateral clearance, location and installation are as per relevant clauses of Schedule 'D'. Overhead sign has been installed ahead of major intersections, toll plazas, start / end of Project Road and urban areas as per detailed design requirements.

Kilometre stones, vertical post of sign boards, chevron boards and median kerb paint are faded at few locations which will be rectified by the Concessionaire.

Some of the photographs of sign boards are presented below.

Figure 3-9 Photographs of Road Signages

km. 239+710

km. 192+800

km. 238+970

km. 183+400

km. 182+500

Highway Lighting

Highway lighting is provided at underpasses, flyovers, toll plaza, ROBs and built-up locations. High mast lighting is provided at toll plaza location. Highway lighting is also provided at approaches of underpass and flyovers. Some of the photographs of highway lighting are presented below.

Figure 3-10 Photograph of Street Light

km. 201+100

Crash Barriers

Metal beam crash barriers are provided at bridge approaches, locations of high embankment and sharp curves. All the crash barriers provided by the Concessionaire are maintained at site. Some of the photographs of metal beam crash barriers are presented below.

Figure 3-11 Photographs of MBCB / Crash Barrier

km. 193+850

km. 239+695

Delineators

The traffic delineators are provided by Concessionaire for road users in abnormal condition of weather for the Project Road. The same is maintained by the Concessionaire. Some of the photographs of delineators are presented below.

Figure 3-12 Photograph of Delineator

km. 195+590

Pedestrian Guard Rail

The pedestrian guard rails are provided in the median. It is maintained by the Concessionaire. Some of the photographs of pedestrian guard rails are presented below.

Figure 3-13 Photographs of Pedestrian Guard Rail

km. 195+590

Road Land Boundary

Road land boundary pillars are available on Project Road.

3.9 Avenue Plantation and Median Plantation

Avenue plantations are done only in forest land due to ROW issues and median plantation has been provided along the project length as per IRC specification.

Figure 3-14 Photographs of Median and Avenue Plantation

km. 183+410

km. 180+150

3.10 Toll Plaza

As per the Concession Agreement, there is one existing toll plaza at km. 185.860 near Nanguneri village, with the following infrastructure.

Table 3-3 Details of Summary for Toll Plaza Items

Sr. No.	Particulars	Details
1	Toll Plaza Chainage	km. 185+860
2	Number of Tolling Lanes	10 lanes for toll operation plus 2 lanes for over dimensional vehicles.
3	Weigh in Motion Facility (Number of Lanes)	Yes
4	No. of ETC Lanes	in each direction
5	Number of Toll Booths	9 singles
6	Canopy	Present
7	Administrative Building	Present
8	Parking cum Toilet Block	Present
9	Availability of Tunnel or Elevated Walkway for Movement between Toll Lanes and Administrative Building	Tunnel/No
10	Availability of Static Weigh Bridge	Yes
11	Availability of Loading/Unloading Facility for Overloaded Vehicles	No
12	Storage facility for Overloaded Material	No
13	High mast Light	Yes
14	Streetlight	Yes
15	Low mast Light	No
16	User Fee Boards	4
17	Cantilever/Gantry Boards	Yes
18	Automatic boom barrier	Yes

Figure 3-15 Photographs of Toll Plaza

Toll Plaza at km. 243+200

3.11 Lane Equipment

Following are the lane hardware and equipment installed at toll plaza.

1. RFID ETC Transceiver
2. Lane Controller with Industrial PC
3. AVC Sensors
4. Automatic Lane Barrier (ALB)
5. Lane Traffic Light and user fare display
6. Incident Capture Camera
7. Overhead Lane Signals
8. Traffic Lights
9. Toll Booth Equipment

3.11.1 RFID ETC Transceiver

RFID ETC Transceiver reads tags installed on the windshield of vehicles and mounted on a pole at about 6 m height. Handheld RFID readers are provided (1 no. in each direction) in case a tag is not detected by the fixed reader.

3.11.2 Lane Controller with Industrial PC

Toll Lane Controller is located within the Electronic Enclosure placed inside each toll booth which are connected to the common server and are capable of independent storage of data.

3.11.3 Automatic Vehicle Classification (AVC) Sensors

The AVC equipment comprises of a camara based sensors, axle sensors and inductive loops. The height detector has a high sensing resolution and detects height when object blocks the path. The presence of vehicle is detected by inductive loop. The loop sensors embedded on the pavement trigger the AVC height sensors located on parallel pillars.

3.11.4 Automatic Lane Barrier

Boom barriers installed on all lanes are in working condition and have a working time of 0.6 - 0.9 s. Automatic Lane Barrier is used to allow only authorized vehicles to pass through the lane. The barrier is activated only on generation of user fee receipt or other relevant vehicle processing activity. A torque motor powers the barrier for raising and lowering the boom. The motor can be blocked at any position without causing any damage. In the event of power failure, the boom is automatically raised. The boom weight is exactly balanced by built-in springs.

ALB at Toll Plaza

3.11.5 Lane Traffic Light (LTL) and User Fare Display (UFD)

Lane Traffic Light (LTL) is used to instruct vehicles to stop or pass through the lane. The LTL is RED when the toll collector is expecting the vehicle at the booth. After the transaction is done; the LTL turns Green to instruct the vehicle to pass through the lane. The User Fare Display is a part of electronic toll collection equipment located at the toll booth. It is a mini variable message sign (VMS) made of Light Emitting Diodes (LED). The user fare display is used to display the toll fare that is due and that must be paid by the motorist and the classification of vehicle selected by the collector.

LTL at Toll Plaza

3.11.6 Incident Capture Camera (AVC Camera)

The incident capture camera is installed on island of the booth to capture the image of the vehicle from the back side. The AVC triggers the Image capture system.

3.11.7 License Plate Image Capture Camera (LPIC)

License Plate Image capture camera is installed on a 3 m pole facing incoming vehicle to capture the image of the vehicle number plate.

LPIC at Toll Plaza

3.11.8 Over Head Lane Signal (OHLS)

The **Overhead Lane Signal (OHLS)** for lane "Open" and "Close" sign consists of a pair of "GREEN" (arrow) and "RED" (cross) lights. The OHLS is located at the vehicle approaching side of the canopy to show the drivers whether the lane is open or closed.

OHLS at Toll Plaza

3.11.9 Toll Booth Equipment

Toll Booth Hardware / Equipment provided are:

- Toll Collector Display (Operator Monitor)
- Customized Industrial Keyboard
- Receipt Printer
- Intercom Slave unit
- Bar code reader
- Violation Light and alarm
- Manual Booth Control (MBC)
- Booth Camera

The operator monitor termed as Toll Collector Display (TCD) is located on the toll collector's desk. It is the system's interface to the toll collector, to display the status of transactions and status of the lane peripherals.

The keyboard on the toll terminal is a programmable keyboard for Registration of toll operations and is customized for different vehicle types and type of ticket.

Thermal printers are installed at the toll booths to print tickets. Intercom slave unit facilitates communication with the master unit located in the control room.

Violation system has an alarm switch which is triggered whenever there is a violation such as run-through happening on the lane. When there is an emergency, a foot switch pressed by the booth operator alerts the control room.

Booth Cameras are provided on the inside roof corner of the booth to provide surveillance through CCTV screen located in the control room. Manual Booth Controller is used to release exempt vehicles.

3.11.10 Medium Speed Weigh in Motion (MSWIM)

Medium Speed Weigh in Motion (MSWIM) is installed on entry lanes of Toll Plaza.

MSWIM at Toll Plaza

3.12 Plaza Equipment

3.12.1 TMS Server

Plaza Server is provided in a hot standby configuration and provided with port non-POE network switch and Port PoE switch. Internet connectivity is available through one lease line (Airtel) and Jio WiFi module. Firewall with Sophos antivirus is provided.

3.12.2 55” LED screen for CCTV monitoring

55” LED screen for CCTV monitoring installed at the toll plaza admin block provides view of all the toll booths, important zones within the plaza where cash transactions take place (server room, control room, cash up).

The toll plaza manager is able to observe the activities at the toll lanes and toll booth. When the toll collector calls up on the intercom, the manager is able to comprehend the situation at the lane by a zoomed view of the particular lane.

3.12.3 Workstations in Control Room, POS room

Workstations are available in control room (lane monitoring, administration, and audit), cash room and PoS.

3.13 Advanced Traffic Management System (ATMS)

Advanced Traffic Management System (ATMS) installed for the Project Road is controlled by the ATMS center at the toll plaza location (km. 185.860). As per Concession Agreement, ATMS shall conform to ATMS Policy guidelines (2016) which comprises of the following:

- Automatic Traffic Counter cum Classifier (ATCC)
- Mobile Radio communication system
- Emergency Call Box

- Portable Weigh in Motion
- Meteorological Data system
- Variable Message Signboards (VMS)
- CCTV system
- Video Incident Detection System (VIDS)
- Vehicle actuated Speed Display (VASD)

Status of these systems at site is described below:

3.13.1 Automatic Traffic Counter cum classifier (ATCC)

Automatic Traffic Counter cum Classifiers (ATCC) is installed at Toll Plaza (km. 185+860).

3.13.2 Mobile Radio communication System (MRCS)

Mobile Radio communication System (MRCS) is not yet installed. Application for MRCS UHF band has been sought from WPC, DoT, Ministry of Communications which is not yet allocated.

3.13.3 Emergency Call Boxes (ECB)

ECB's are not installed at site.

3.13.4 Portable Weigh in Motion (PWIM)

PWIM is provided at site.

3.13.5 MET System

Meteorological sensors comprise of sensors to measure the atmospheric temperature, humidity, pavement surface temperature, visibility and equipment for measuring wind speed and direction and installed at Toll Plaza km 185+860.

3.13.6 Variable Message Signboards (VMS)

Variable message sign boards are installed at 13 locations. These display specific messages to the users based on the prevailing conditions on the highway. The message can be changed at any point of time from the HTMS centre. About 250 customised messages can be stored on the system.

3.13.7 CCTV Surveillance Cameras

Surveillance cameras are installed at 50 locations along the Project Road. The ATMS control room has video wall to monitor these locations through the cameras installed.

3.13.8 Video Incident Detection System

73 Nos. fixed CCTV cameras are installed as part of Video incident detection system.

3.13.9 Vehicle Actuated Speed Display (VASD)

VASD is installed at 8 locations each on LHS and RHS.

3.13.10 Adequacy of Toll Collection System and ATMS

- Adequacy-All lanes are hybrid ETC system as stipulated by NHAI in Technical Specifications of Hybrid ETC system. NHAI has approved maintenance costs for TMS. TMS shall be upgraded every 5 years at the cost of the Authority.

- Advanced Traffic Management System (ATMS) installed is as per specifications required by the Authority and in working condition.

3.14 Traffic Aid Post and Medical Aid Post

Traffic Aid Post and Medical Aid Post are provided at Toll Plaza.

3.15 Toilet Block

There is 01 no. of Toilet Block constructed at site and the same is maintained by the Concessionaire. The details of the same are presented below.

Table 3-4 Details of Toilet Block

Sr. No.	Chainage (km)	Side		Remarks
		LHS	RHS	
1	185+860	Yes	-	

3.16 Bus Bays and Passenger Shelters

There are 30 Nos. of bus bays / shelter along the Project Road. Some of the photographs of the bus bays are presented below.

Figure 3-16 Photographs of Bus Bay / Passenger Shelter

km. 192+820 (LHS)

3.17 Balance Work Status

During site visit it has been observed that construction work of 01 No. of VUP at km. 235+550 is in progress. The cost of Balance Work is presented in the subsequent chapter.

3.18 Operation and Maintenance

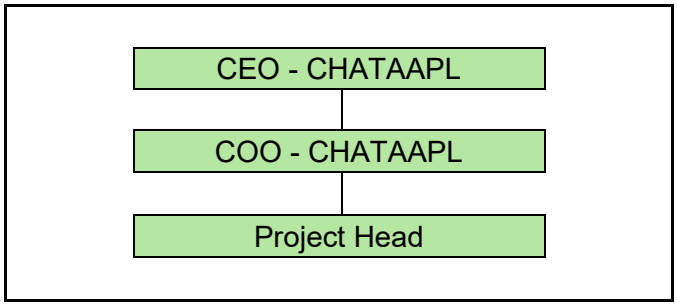
3.18.1 O&M Contract

As per Clause 15.1 of the Concession Agreement, the Concessionaire shall operate and maintain the Project Road by itself, or through O&M Contractors and if required, modify, repair, improve the Project Road to comply with Specifications and Standards, and other requirements set forth in the Agreement through Good Industry Practice, Applicable Laws and Applicable Permits and manufacturer's guidelines and instructions with respect to toll systems. The Operation and Maintenance activities shall conform to all the requirements laid down in MoRT&H, IRC Specifications and the Concession Agreement. The Concessionaire has outsourced for carrying out the activities related to operation and maintenance of the Project Road including toll operation services, security services, AMC for TMC and AMC for DG set.

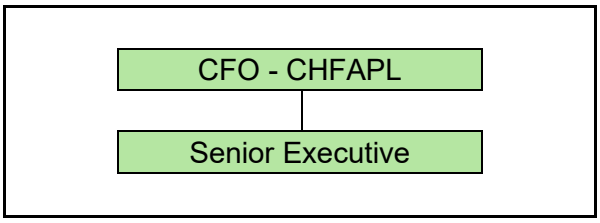
3.18.2 Organization Chart

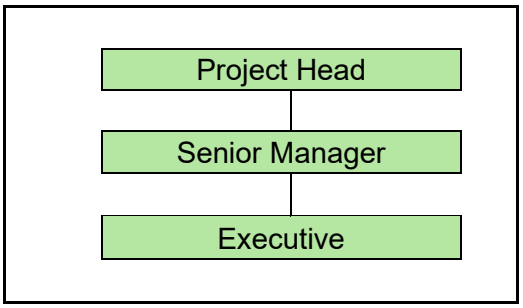
The Concessionaire has given the Organization Chart at site for Operation and maintenance. Accordingly, there is 01 Project Head, 01 Senior Executive (HR), 01 Manager (TMS / IT), 01 Executive (TMS / IT), 01 supervisor, 01 executive, 01 electrician 01 Plaza Manager, 01 Assistant Plaza Manager, 03 Cashiers and 04 validators to carry out O&M activities. The team controls the maintenance activities. However, the maintenance work is undertaken and executed through competent subcontractors.

Organization Chart

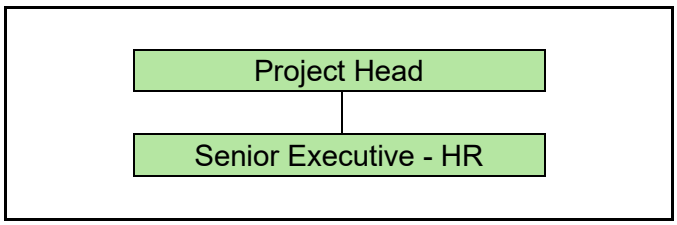


Finance & Accounts

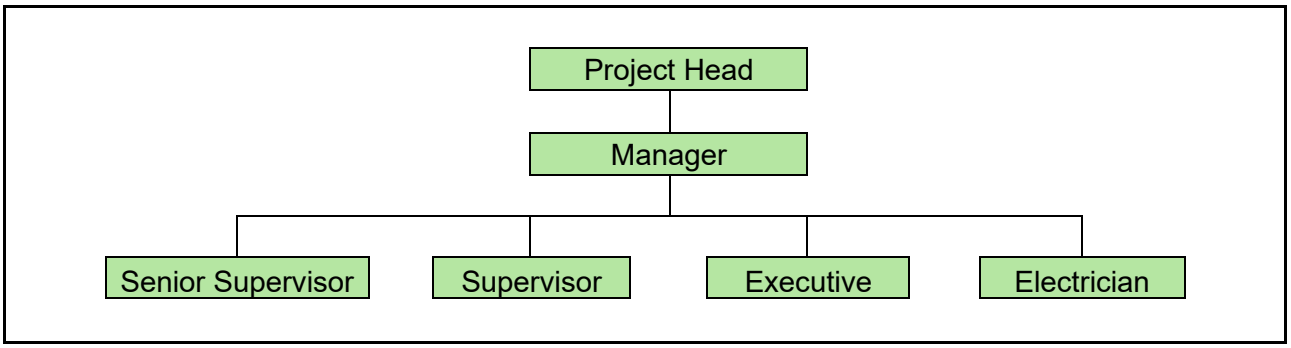




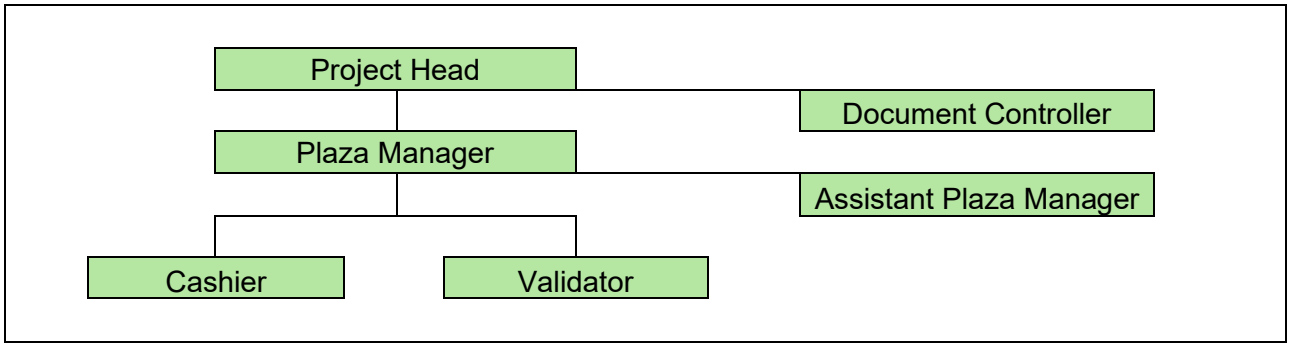
Human Resource



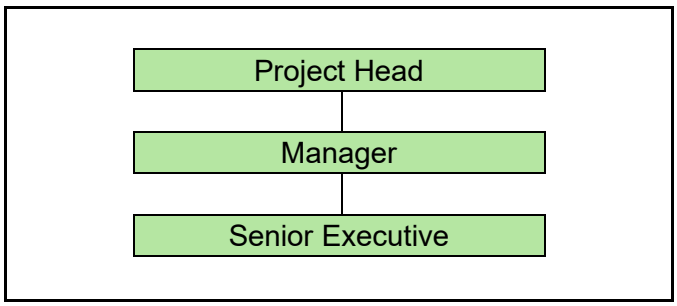
Operation & Maintenance



Operations System



Traffic and safety



3.18.3 Operation

Operation cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses and other miscellaneous expenses. The Concessionaire has provided the expenses occurred towards operation expenses for past years. Necessary assumptions have made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area.

The Operation Cost is presented in the subsequent chapter.

3.18.4 Routine Maintenance

The Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey.

Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Maintenance Cost is presented in the subsequent chapter.

4 PAVEMENT INVESTIGATION AND ASSESSMENT

4.1 General

Article 15 and Schedule-F of the Concession Agreement defines the Operation and Maintenance requirement during the concession period.

The project is currently under the Operation and Maintenance stage. The concession period of the project is 30 years from the Appointed Date (as TOT Package i.e., 20th October 2020) including construction period.

4.2 Axle Load and VDF

The Concessionaire has conducted the Axle Load Survey on Project Road at km. 185+860 (near Toll Plaza) from 19th March 2020 to 21st March 2020. The summary of Vehicle Damage Factor (VDF) calculated as provided by the Concessionaire is tabulated below.

Table 4-1 Vehicle Damage Factor (VDF)

Sr. No.	Vehicle Type	Direction	
		Madurai - Kanyakumari	Kanyakumari - Madurai
1	BUS	0.725	0.869
2	LCV	0.800	0.570
3	2-Axle	2.850	2.599
4	3-Axle	7.108	3.805
5	MAV	14.429	6.201

4.3 Design Traffic

Traffic in Million Standard Axles (MSA) for the homogeneous section based on the historical traffic data as provided by the Concessionaire, current traffic has been used for future projections and the estimated design MSA is computed and presented in subsequent table.

For the estimation of design MSA, Actual Traffic Growth Rates as provided by the Concessionaire were used.

Table 4-2 MSA Calculation

MSA Calculations					
Year	MSA (LHS)	Cumulative MSA (LHS)	MSA (RHS)	Cumulative MSA (RHS)	Remarks

FY52	3.97	**86.00**	2.16	**47.41**	End of concession period

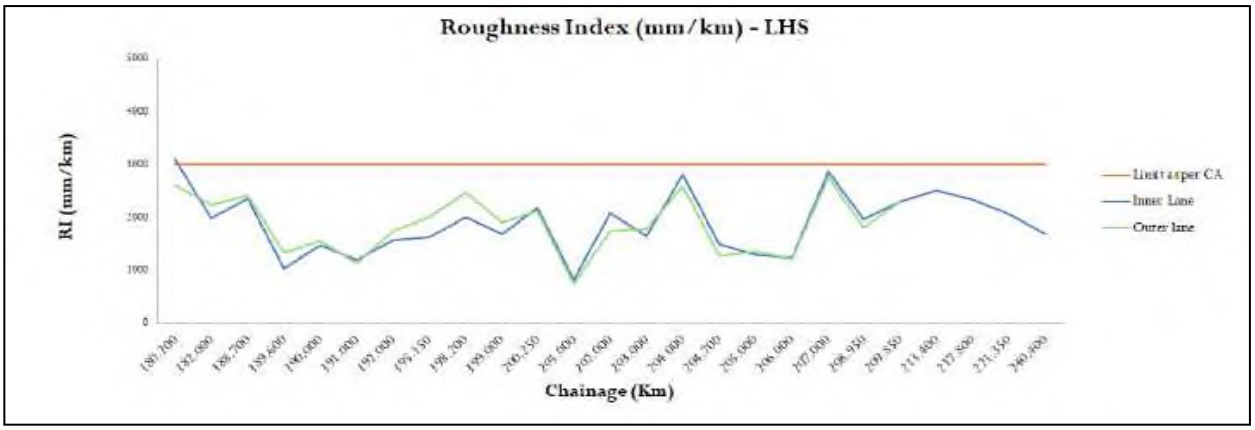
4.4 Network Survey Vehicles (NSV) Survey

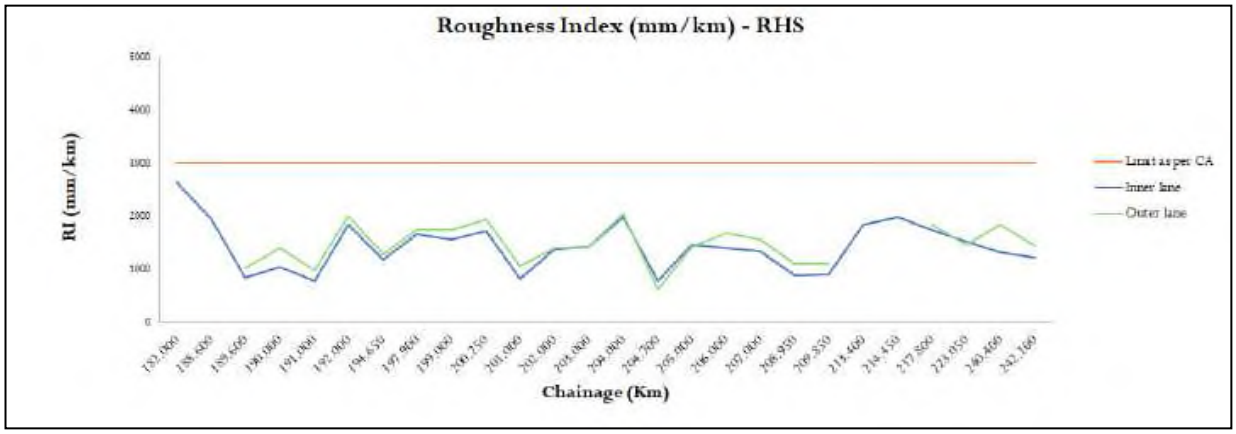
Roughness Index

The Concessionaire has conducted pavement condition survey on each lane of carriageway through NSV. The NSV survey was conducted on the Project Road in March 2026. The summary of the same is presented below.

Table 4-3 Summary of Roughness Index

Roughness Summary % as per Schedule F of CA (mm/km) - MCW					
Condition	Limit as per Schedule F of Concession Agreement (mm/km)	LHS		RHS	
		Inner Lane	Outer Lane	Inner Lane	Outer Lane
Good	<3000	100.00%	100.00%	100.00%	100.00%
Poor	>3000	0.00%	0.00%	0.00%	0.00%

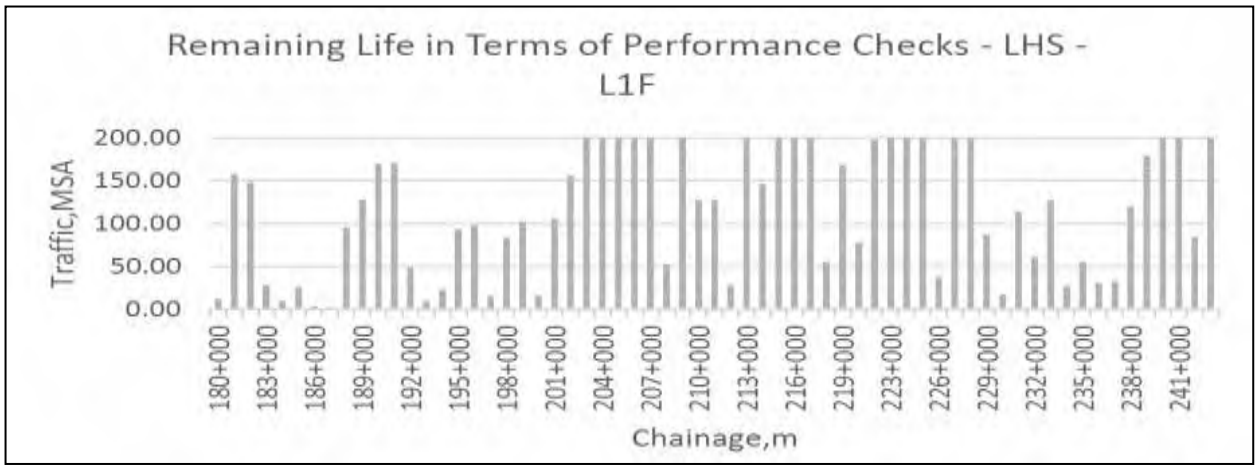


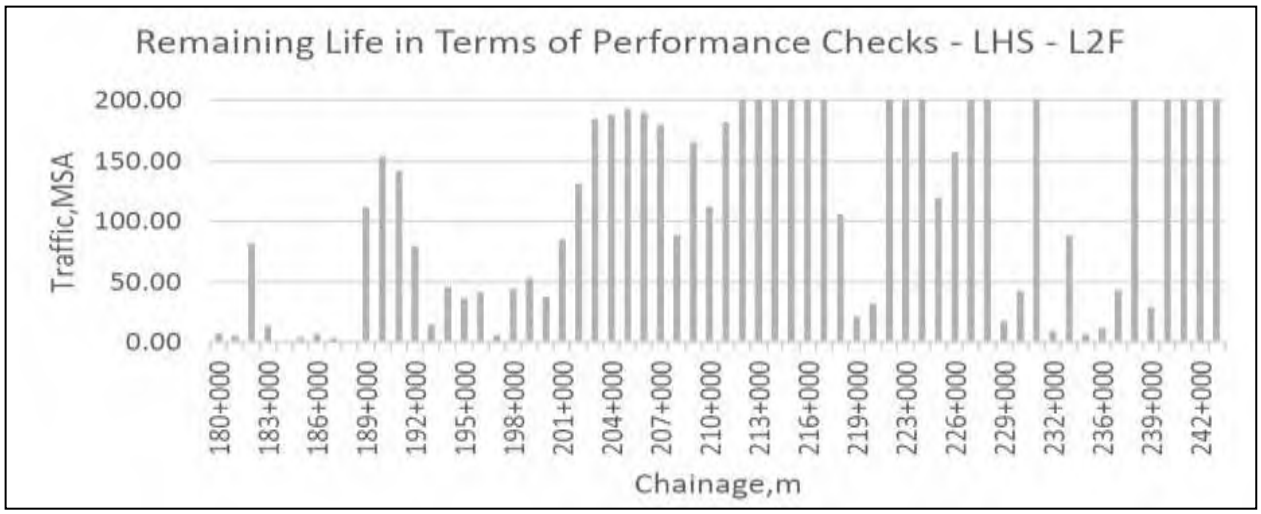


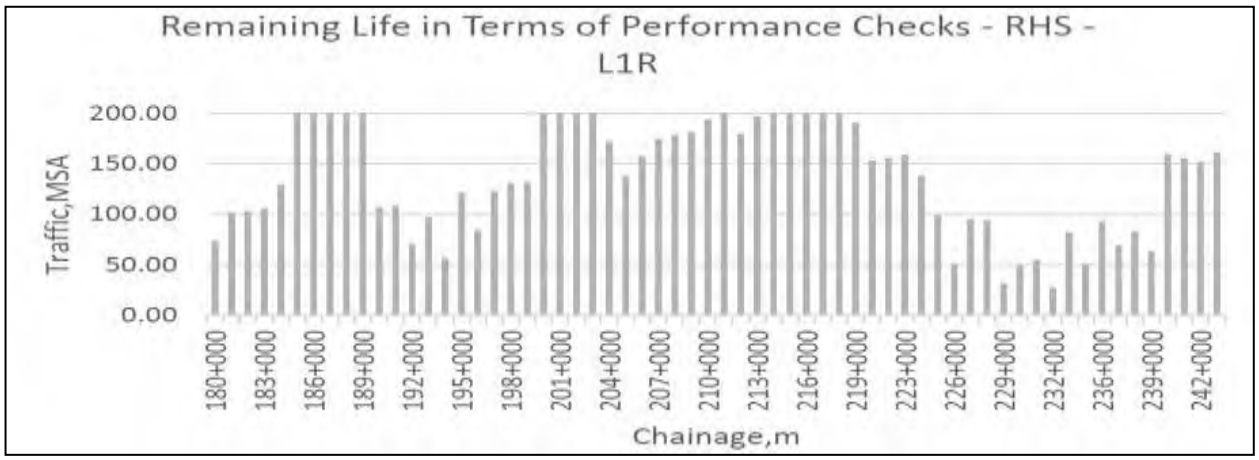
4.5 FWD Survey

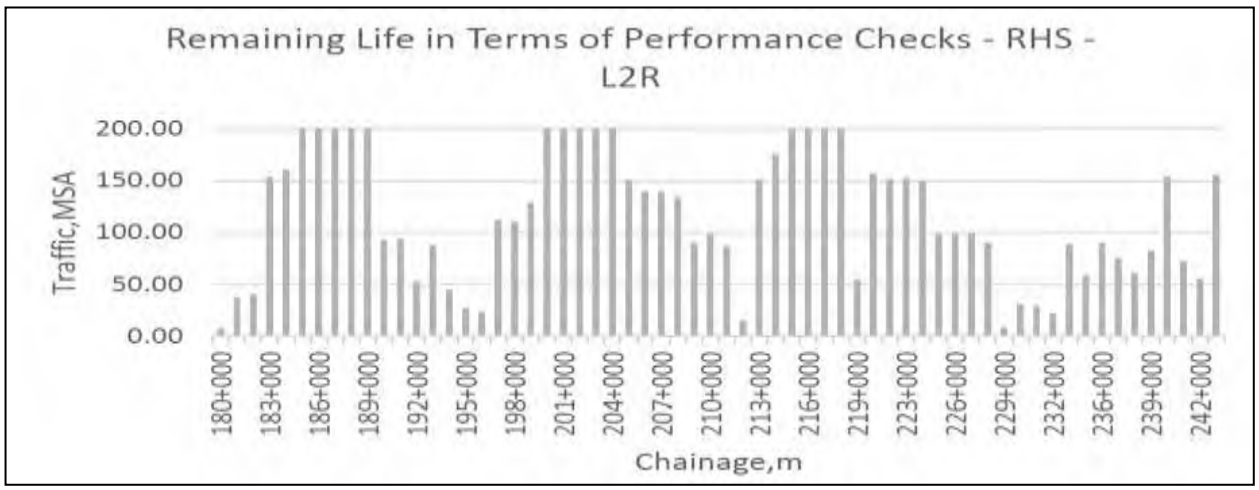
The structural evaluation and analysis of the remaining life of project was carried out in conformity with IRC:115-2014"Guidelines for Structural Evaluation and Strengthening of Flexible Road Pavements Using Falling Weight Deflectometer (FWD) Technique".

The FWD survey was conducted on the Project Road on 07th March 2026 to 13th March 2026. The summary of the same is presented below.









However, the maintenance can be carried out on as and when required basis and to the compliance of Schedule-F requirement to maintain the road in serviceable condition. However, improvement in Riding Quality is expected if the roughness value exceeds 3000 mm/km.

4.6 Test pit and Subgrade Investigation

The Concessionaire has carried out the subgrade investigation for Project Road. The results of the same as provided by the Concessionaire are tabulated as below.

Sr. No.	Road Name	Existing Chainage (km)	Side	DCP-CBR
1	NH-7	182+200	RHS	13.0
2	NH-7	184+800	LHS	10.6
3	NH-7	187+500	RHS	12.4

4.7 Periodic Maintenance Strategy

Unlike the old Concession Agreements where periodicity and threshold limits were clearly described for the major maintenance, the Concession Agreement of this project does not specify the periodicity or the threshold limits for carrying out the full-length periodic maintenance. Schedule-F of the Concession Agreement specifies the threshold limits and the timeline for carrying out repairs to the distresses during the operation period.

The maintenance thus can be carried out as and when required basis and to the compliance of Schedule-F requirement to maintain the road in serviceable condition. Only improvement to Riding Quality is expected if the roughness value exceeds 3000 mm/km.

Overlay work is completed at site on both side of the carriageway in the month of October 2021 i.e., FY 2022. Thus, next cycle of the overlay is proposed in FY 2029 after 7 years from previous MM cycle.

As per Article 14 of CA, the Authority shall carry out capacity augmentation under EPC contract if traffic exceeds 40,000 PCU for three consecutive accounting years. As per the traffic study report submitted by the Company it is observed that, the project traffic crosses 40,000 PCU in FY 2039, FY 2040, FY 2041. Assumption has made that execution of 6-laning of Project Road will start in the year 2044 or 2045. It is also assumed that during 6-laning of Project Road, overlay of existing four lane road will be the part of the capacity augmentation. Hence, the major maintenance cycle is adjusted accordingly.

The table below shows the major / periodic maintenance cycle throughout the concession period for the Project Road.

Table 4-6 Major Maintenance Cycle

Sr. No.	Year	Main Carriageway	Service Road
1	FY 2027 to FY 2028	-	
2	FY 2029	Major maintenance with 30 mm BC with PMB (100%) + Milling & 50 mm DBM (7%)	Major Maintenance with 30 mm BC with VG-40 (50%) + Micro-surfacing (50%)
3	FY 2030 to FY 2035	-	
4	FY 2036	Major maintenance with 30 mm BC with PMB (100%) + Milling & 50 mm DBM (6%)	Major Maintenance with 30 mm BC with VG-40 (50%) + Micro-surfacing (50%)
5	FY 2037 to FY 2042	-	
6	FY 2043	Major maintenance with 30 mm BC with PMB (100%) + Milling & 50 mm DBM (5%)	Major Maintenance with 30 mm BC with VG-40 (50%) + Micro-surfacing (50%)
7	FY 2044 to FY 2046	Assumption of Capacity Augmentation to Six Lane Configuration	
8	FY 2047 to FY 2051	-	
9	FY 2052	End of Concession Period	

The projected cost for periodic / major maintenance is presented in the subsequent chapter.

5 COST ESTIMATES

5.1 General

Based on the assessment carried out in previous chapters, various costs were worked out. The costs are divided into following categories.

I. Balance Works Cost
II. Routine O&M Cost
III. Major Maintenance Cost
IV. Periodic Replacement of TMS / ATMS system

Costs for different category are detailed out in subsequent sections along with the assumptions considered for rate and escalation.

5.2 Rate Assumption

Following assumptions are considered for unit rates of various items while estimating the cost:

1. Unit rates of different items (BC, DBM, Concrete, Road markings etc.) are calculated as per the MoRTH Standard Data Book 2019. The input rates for MoRTH standard data book were adopted as below:

   a. **Manpower and Labour:** As per applicable minimum wages published by Ministry of Labour & Employment, Government of India.

   b. **Bitumen:** Concessionaire has long term contract with IOCL for the procurement of bitumen and related products. Same discounts are considered on bitumen procurement for this analysis. Furthermore, we also understand that bitumen prices are primarily dependent on crude oil price and market demand and hence are likely to be very volatile and difficult to predict at this stage.

   Therefore, bitumen prices are considered as per the forecast of Client. Current published of bitumen are considered for unit rates calculation for FY 2027. Average 10 years of price of bitumen are considered for unit rates calculation for FY 2028 and onwards, since bitumen prices have been range bound over the last five-six years. Following rates of bitumen are considered.

Table 5-1 Bitumen Rates - Ex-MI Supply excluding discount and GST

Supply Location	Applicability of Rates	Product	Current Published Price (16th Feb 26)	Long term price (Avg last 10 years)
Mathura	All States	VG-10	45,102	35,125
		VG-30	46,402	36,137
		VG-40	48,962	38,131
Panipat	All States	VG-10	45,102	35,125
		VG-30	46,402	36,137
		VG-40	48,962	38,131
Koyali	All States	VG-10	47,102	37,125
		VG-30	48,402	38,137
		VG-40	51,082	40,251
Haldia	All States	VG-10	46,602	35,683

Supply Location	Applicability of Rates	Product	Current Published Price (16th Feb 26)	Long term price (Avg last 10 years)
		VG-30	47,402	36,295
		VG-40	49,962	38,256
Barauni	All States	VG-10	47,132	36,213
		VG-30	48,432	37,325
		VG-40	50,992	39,286
CPCL	Kerala	VG-10	47,402	35,519
		VG-30	48,402	36,395
		VG-40	50,762	38,120
CPCL	Tamil Nadu	VG-10	47,902	36,019
		VG-30	48,402	36,395
		VG-40	50,962	38,320
CPCL	Telangana and Andhra Pradesh	VG-10	44,602	32,719
		VG-30	45,402	33,395
		VG-40	47,962	35,320
CPCL	Karnataka	VG-10	44,602	32,719
		VG-30	45,402	33,395
		VG-40	47,962	35,320

c. **Sand and Aggregate:** Rates are taken from Public works Department Tamilnadu SOR FY 2025-26.

d. **Cement:** Rates are taken from Public works Department Tamilnadu SOR FY 2025-26.

e. **Steel :** Rates are taken from Public works Department Tamilnadu SOR FY 2025-26.

f. **Machinery Hire charges:** Hire charges for the machinery are considered in accordance with applicable PWD SOR.

g. **Actual Rates of items as per work order:** The rates of road marking, road stud, kerb raising, micro surfacing, milling, median filling rates etc. are considered as per the work order shared by the client.

2. Goods and Service Tax (GST) is considered as 18% as per the latest Government Guidelines.

Summary of Unit Rates worked out using Standard Data Book adopted for major items is given below.

Table 5-2 Summary of Unit Rates

Sr. No.	Item Description	Unit	Rates (Rs.)
1	Dense Bituminous Macadam	Cum	9,267
2	Bituminous Concrete (VG40)	Cum	10,419
3	Bituminous Concrete (PMB)	Cum	12.262
4	Milling	Sqm	90
5	Micro-surfacing	Sqm	162

Sr. No.	Item Description	Unit	Rates (Rs.)
6	Kerb Re-laying	Rmt	330
7	Road Marking on BC surface	Sqm	573
8	Road Marking on micro surface	Sqm	713
9	Road Studs	Nos.	202

5.3 Balance Work Cost

As discussed in previous chapters, construction work of 01 Nos. of VUP at km. 235+550 is in progress. The Concessionaire has issued work order to PVC Infrastructure Pvt Ltd. for construction of VUP at km. 235+550. The cost of construction of VUP as per work order is Rs. 26.69 Cr. (including GST). The construction period is 15 months from the issued of work order.

Figure 5-1 Photographs of VUP approach (Work in progress)

Construction of VUP approach in progress

It is to be noted that at present, at one location along the Project Road, NHAI has allotted COS work to third party on stand-alone basis. In the said location along the project length, underpass & approach construction is being carried out by the third party. Thus, a total length of 1.60 km of project length (where COS / new construction works are in progress), out of total project length of 63.470 km, is not under the maintenance scope of the concessionaire at present.

5.4 Routine O&M Cost

Routine O&M cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses, horticulture and ROW maintenance, routine maintenance and other miscellaneous expenses. The Concessionaire has provided the major agreements towards operation and maintenance for past years. Necessary assumptions have made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area. Same has been divided into following major heads.

1. Salary and Welfare Expenses
2. Tolling Operations Services
3. Incident Management Services
4. Electricity and Diesel Charges

5. TMS / HTMS / System Expenses
6. Office Operating Expenses
7. Vehicle Running Expenses
8. Professional Fees Expense
9. Insurance Expense
10. IE Fees
11. Horticulture & ROW Maintenance
12. Routine Maintenance Cost

In above, the Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey. Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or "wear-and-tear". Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.
The Routine Operation Cost is presented as below. The detailed working of routine maintenance (Sr. No. 15 of below table) is presented in **Annexure-I.**

Table 5-3 Summary of Operation Cost

Sr. No.	Particulars	Amount (FY 2027 to FY 2047)	Amount FY 2048 to onwards
1	Salary and Welfare Expenses	1,40,11,290	1,40,11,290
2	Tolling Operations Services	2,29,57,775	2,29,57,775
3	Toll Security Services	53,12,874	53,12,874
4	Incident Management & Emergency Services	3,13,15,320	3,13,15,320
5	Electricity and Diesel Charges	39,79,944	39,79,944
6	TMS/HTMS/System Expenses	59,66,843	46,93,241
7	Office Operating Expenses	35,20,703	35,20,703
8	Vehicle Running Expenses	27,60,000	27,60,000
9	Professional Fees Expense	68,82,488	1,03,62,511
10	Community Development	11,50,000	11,50,000
11	Communication Expenses	3,47,156	3,47,156
12	Conveyance Expenses	3,78,716	3,78,716
13	Insurance Expense	62,47,418	62,47,418
14	IE Fees	79,45,711	79,45,711
15	Routine Maintenance Cost	3,34,87,696	4,35,04,952
16	Horticulture & ROW Maintenance	2,12,91,037	2,12,91,037
17	Miscellaneous including Contingency	45,11,049	45,99,306
	Total Cost (Rs.)	**17,20,66,019**	**18,43,77,954**
	Total Cost (Cr.)	**17.21**	**18.44**
	Per km Cost (Lakhs)	27.11	29.05

5.5 Major Maintenance Cost

The summary of Major Maintenance Cost is provided as below. The detailed working of the same is presented in **Annexure-II**.

The summary of Major Maintenance Cost is provided as below.

Sr. No.	Year	Major Maintenance Cost (Cr.)	Remarks
1	FY 2027 to FY 2028	-	
2	FY 2029	76.79	
3	FY 2030 to FY 2035	-	
4	FY 2036	84.51	
5	FY 2037 to FY 2042	-	
6	FY 2043	75.53	
7	FY 2044 to FY 2052	-	End of concession period
Total Cost (Cr.)		**236.82**	

5.6 Periodic Replacement of TMS / ATMS System

Every 7 years, replacement of cost of major TMS / ATMS system is considered. The same is provided as below.

Sr. No.	Year	HTMS O&M / Replacement Cost (Cr.)	Remarks
1	FY 2027	7.54	
2	FY 2034	7.54	
3	FY 2041	7.54	
4	FY 2048	7.54	
Total Cost (Cr.)		**30.18**	

5.7 Escalation Assumption

Following escalation has been considered for the O&M cost as provided by Client.

Table 5-4 Escalation

Year	Escalation	Year	Escalation
2025	-	**2041**	3.99%
2026	-	**2042**	3.99%
2027	5.25%	**2043**	3.99%
2028	4.86%	**2044**	3.99%
2029	4.44%	**2045**	3.99%
2030	4.24%	**2046**	3.99%
2031	4.13%	**2047**	3.99%
2032	4.08%	**2048**	3.99%
2033	4.01%	**2049**	3.99%
2034	4.00%	**2050**	3.99%
2035	4.03%	**2051**	3.99%
2036	4.01%	**2052**	3.99%
2037	3.98%	**2053**	3.99%
2038	3.98%	**2054**	3.99%
2039	4.00%	**2055**	3.99%
2040	3.99%	**2056**	3.99%

5.8 Summary of Cost

Different O&M cost have been worked out based on the investigations and assessment on Project Road. Cost for each of the category has already discussed in previous sections. Since the forecasting has been carried out for remaining concession period, the cost is summaries yearly for remaining concession period along with escalation as mentioned in clause 5.7.

Escalated O&M Cost (in INR Cr.)

Sr. No.	Year of expense	FY27	FY28	FY29	FY30	FY31	FY32	FY33	FY34	FY35	FY36	FY37	FY38	FY39	FY40	FY41	FY42	FY43	FY44	FY45	FY46	FY47	FY48	FY49	FY50	FY51	FY52

Ordinary Repairs

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity**
				More than 4500 CVD
				BT Surface
1	**2**	**3**	**4**	**5**
1	**Maintenance of Carriageway & Paved Shoulders (1.5m wide); B.T. Surface**			
	i) Potholes repair (50 mm deep)	100 % Pothole free	As & when required	1.00%
	Volume (cum)			5.00
	Rs/m^3			11505
	Cost in Rupees			57,525
	ii) Patch repair	100 % Patch less	As & when required	1.00%
	Area (sqm)			100
	Rs/m^2			460
	Cost in Rupees			46,020
	iii) Sealing (Crack)			
	a) Wider than 3 mm	100 % Crack Less	As & when required	2.50%
	Area (sqm)			250
	Rs/m^2			81
	Cost in Rupees			20,243
	b) Width less than 3 mm	75 % Crack Less	As & when required	2.50%
	Area (sqm)			187.5
	Rs/m^2			54
	Cost in Rupees			10,135
	iv) Repair of ruts and undulations			
	a) Greater than 20 mm	75%	As & when required	1.00%
	Area (sqm)			75
	Rs/m^2			460
	Cost in Rupees			34,515
	v) Road marking	14%	Once in 7th year &	15928

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)

Chapter 1.

Introduction

Chapter 1. INTRODUCTION

1.1 Background

Cube Highways Fund Advisors Pvt Ltd (hereinafter referred as "the Client") is the Investment Manager of the Cube Highways Trust ("Trust" or "InvIT"). The Trust is registered with Securities and Exchange Board of India ("SEBI") as an infrastructure investment trust under the SEBI InVIT Regulations. Cube Highways Fund Advisors Pvt Ltd has appointed M/s Knight Frank India (KFI) (hereinafter referred as "Technical Consultant" or "KFI") to carry out Technical Due Diligence of **Rehabilitation, Strengthening, and Four-Laning of the Quazigund to Banihal section (from km 189.350 to km 205.618), including construction of two 2-lane tunnels spanning a total of 8.45 km,** was conceptualized in the Union Territory of Jammu & Kashmir. This project was structured on a DBFOT (Annuity) model.

1.2 Scope of Work

Exhibit 1 Scope of TDD Services

S. No	Terms of Reference
1.	A reconnaissance of the Project Road to understand the current condition of the pavement, structures, road furniture, toll plaza and other highway assets.
2.	Review and assessment of important technical documents like CA, pavement design report, O&M report, DPR, as built drawings, O&M manual, COD/PCOD certificate, Punch list, previous major maintenance etc.
3.	Review of recent pavement investigations and surveys conducted on Project Road like FWD, NSV, Axle Load, material investigations etc.
4.	Formulation of future major maintenance Strategy.
5.	Estimation of any initial expenses to be incurred due to deficiencies observed in diligence.
6.	Estimation of Routine Maintenance and Major Maintenance forecast for remaining concession period

S. No	Terms of Reference
7.	Estimation of Annual Operation expenses along with Systems cost (TMS/HTMS) till the end of concession period.
8.	Review of balance work cost for Project Road including estimation of quantities and item rates

1.3 Approach

Approach followed for this Due Diligence study is to understand the requirement of the client and terms of reference set forth. Our aim is that the study report should assist the clients in achieving their objectives.

1.4 Methodology

Methodology adopted is broadly outlined as under:

- Objectives of the client were identified from discussions and terms of reference spelt out for the study.
- Available data was collated and analysed by desk study.
- Requirements were identified to augment information/ data as available.
- Detailed List of data required was sent to Mapple team from time to time
- Personal discussions were carried out with Clients by senior executives from KF to explain data requirements.
- Extensive interaction was made by KF with Clients and data was collected.
- Information to be gathered from Client head office & team were listed
- Relevant documents regarding project highway, including CA Agreement and other documents were collected and the provisions studied in detail.
- All data as collected was duly collated and arranged in the order as required for preparation of the report.

1.5 Study

- Data collected from all sources was duly collated and disseminated to concerned experts in KF.
- Project documents such as CA Agreement, O&M Costing details, O&M Manual etc were studied in detail.
- The data made available was analysed, and comments formulated for inclusion in the report.

1.6 Structure of the Report

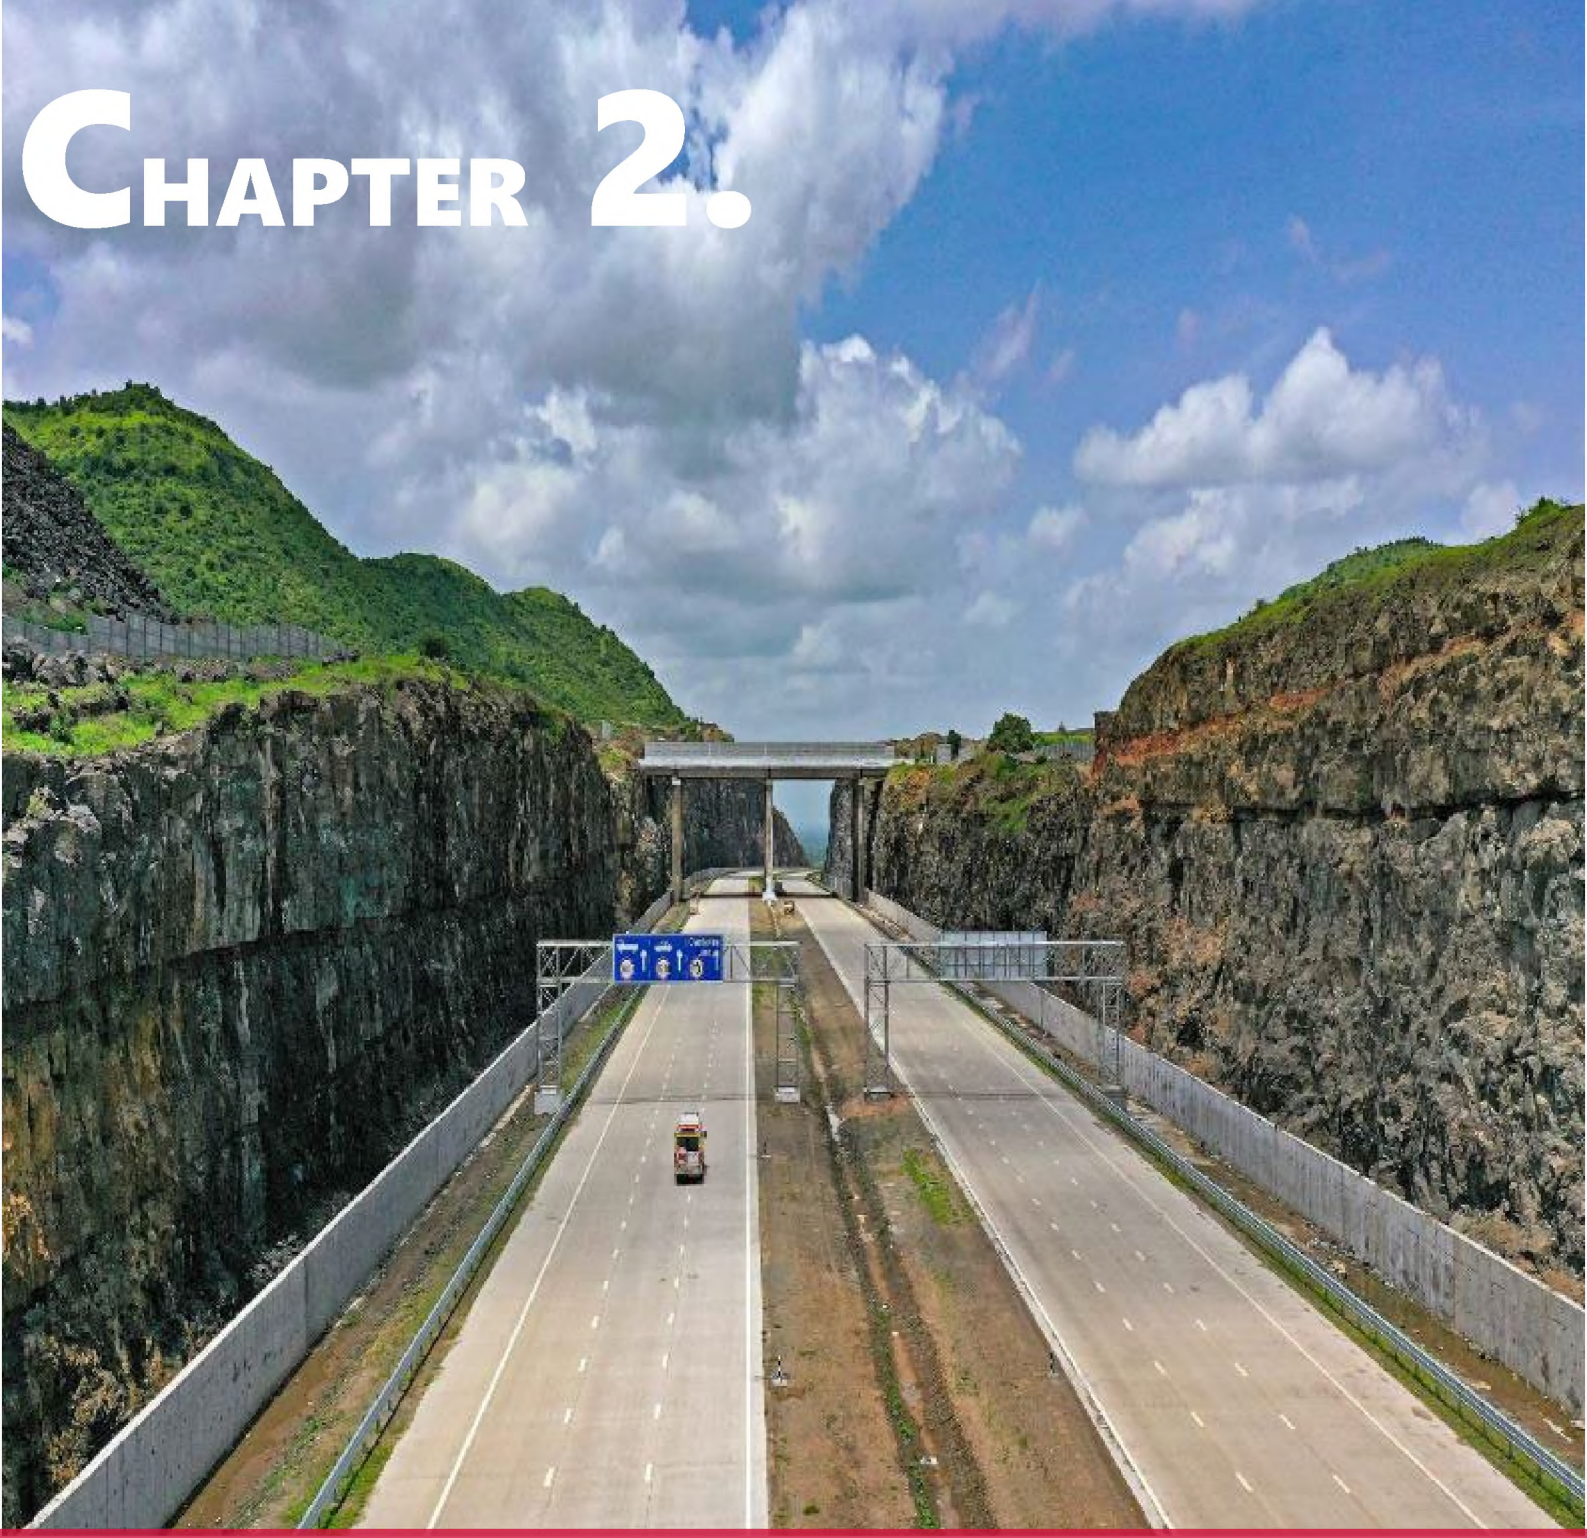
This report has been prepared based on the information, reports and documents made available to us by the Company. We have also referred to publicly available reports, literature etc. and have made our best efforts to check the authenticity of the information available, analyse the same as per the best engineering / industry practices.

The report is organized with the following chapters for easy understanding of various issues –

Exhibit 2 Structure of the Report

S.nos	Chapter	Description
1	**Chapter 1**	**Introduction:** The chapter gives an overview of the project background, detailed scope of work, approach, and methodology for due diligence studies**.**
2	**Chapter 2**	**Project Description:** The chapter describes existing project features, overview of project development.
3	**Chapter 3**	**Review of Agreements:** The chapter describes review of CA, Supplementary, State Support Agreement, Settlement Agreement & Various O & M Agreements.
4	**Chapter 4**	**Condition Assessment of Project Road:** The chapter presents the details and condition of various essential features of the Project Road based on site visit**.**
5	**Chapter 5**	**Pavement Investigation and Assessment:** This chapter describes the summary of pavement surveys and investigations carried out on Project Road along with the requirement of pavement maintenance
6	**Chapter 6**	**Cost Estimates**: This chapter summarizes the forecasting of O&M and major maintenance cost over the remaining concession period

Chapter 2.



Project Description

Chapter 2. PROJECT DESCRIPTION

2.1 Location of Project Road

This asset is a DBFOT (Annuity) project that involves the operation and maintenance of a four-lane stretch from Quazigund to Banihal, covering km 189.350 to km 205.618 of NH-44, including two tunnels (2-lane each) with a combined length of 8.45 km on NH-1A, situated in the Union Territory of Jammu & Kashmir. The Banihal–Quazigund Road Tunnel, spanning approximately 8.45 km, is positioned at an elevation of 1,790 meters (5,870 feet) beneath the Banihal Pass in the Pir Panjal range of the lower Himalayas. This vital infrastructure connects Anantnag and Ramban districts, significantly improving regional connectivity by reducing the distance between Srinagar and Jammu by 16 km and cutting travel time from 6 hours to approximately 5.5 hours.

As one of the longest road tunnels in India, it serves as a key all-weather route, bypassing the previously troublesome Jawahar Tunnel and Shaitan Nalla—areas often rendered impassable during winter due to snowfall and landslides. Its lower elevation compared to the Jawahar Tunnel (by 400 meters) makes it less susceptible to avalanches, ensuring year-round connectivity between Kashmir and the rest of India.

The tunnel is equipped with advanced features including forced ventilation for air circulation, 126 jet fans to prevent harmful gas buildup, cross passages every 500 meters for emergency evacuation, and state-of-the-art safety and monitoring systems. These include 234 CCTV cameras and a comprehensive fire-fighting system installed throughout the twin tubes. Constructed using the Austrian tunnelling method, the tunnel exemplifies modern engineering and plays a vital role in enhancing transportation efficiency and strategic connectivity in the region.

Following a competitive bidding process, the contract was awarded to a consortium comprising **M/s Navayuga Engineering Company Limited and M/s Krishnapatnam Port Company Limited,** with Navayuga Engineering serving as the lead member. In order to implement the project, the consortium incorporated a Special Purpose Vehicle (SPV) named M/s Navayuga Quazigund Expressway Private Limited. The Concession Agreement was signed on 13th July 2010.

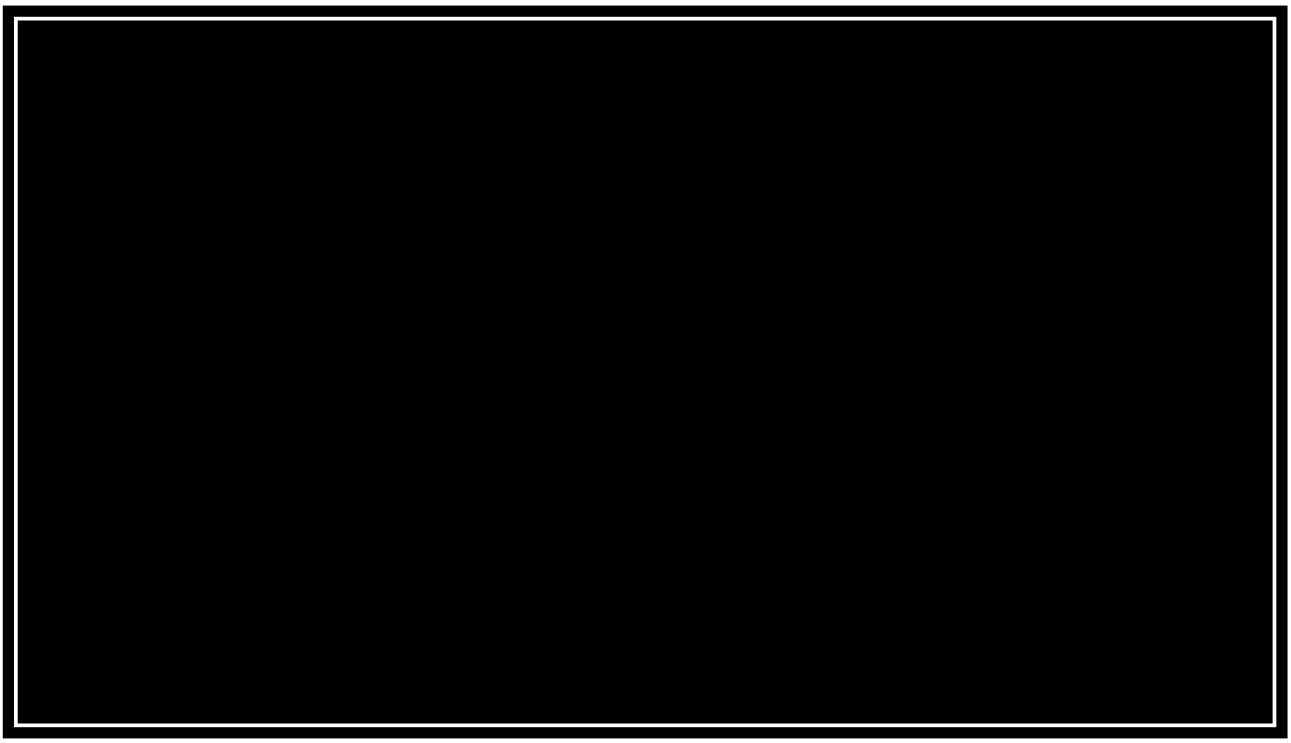
The project road achieved Provisional Completion (PCOD) on 31st July 2021, followed by the receipt of the Completion Certificate on 15th December 2022. Currently, the project is in the Operations and Maintenance (O&M) phase

The project was subsequently acquired by the National Investment and Infrastructure Fund (NIIF) through its NIIF Master Fund in 12th July 2022.

The project has since been managed by Athaang Infrastructure, NIIF's proprietary roads platform, and the company was renamed ***M/s* Quazigund Expressway Private Limited**. The **current proposed acquisition** of the project is by ***M/s Cube Highways and Infrastructure V Pte. Ltd.***

Accordingly, Technical Consultant has undertaken the work of assessment of operation and maintenance (O&M) cost based on site inspections and flied investigations. Same is presented in this report.

Exhibit 3 Project Location Map



2.2 Terrain

The valleys flanking the Pir Panjal range lie at an elevation of around 1800 meters, while the highest peak directly above the planned tunnel alignment rises to approximately 3000 meters above sea level. Near the northern portal, quaternary soft rocks such as clayey silt are anticipated at shallow depths, only a few tens of meters deep. However, the majority of the tunnel will be excavated through a diverse array of hard rocks with varying lithological characteristics.

During geological field investigations, various rock types and structural features were identified. The sequence of lithologies observed follows a south-to-north trend, moving from older to younger formations.

Quartzite

Quartzite encountered in the region is fine to medium-grained, typically grey to white in color, and appears in thick beds, occasionally interbedded with shale. The rock is siliceous and extremely hard, with bedding planes often lacking joints. Quartzite is predominantly found in the southern section near the south portal, although interbedded quartzite layers also appear within the shale-dominated Mesozoic sedimentary sequence in the northern section. Near the south portal, quartzite exhibits several transitional features, including layers and gradations into conglomerates, indicating complex depositional processes within the massive quartzite formation.

2.3 Climate

The Quazigund–Banihal project corridor, located in the Pir Panjal range of the lower Himalayas in Jammu & Kashmir, experiences a cold mountain climate with significant seasonal variations. Winters, from December to March, are long and harsh, with temperatures often dropping below freezing — average lows near –5°C and highs around 3–5°C — accompanied by heavy snowfall. Summers, from May to August, are mild and pleasant, with daytime temperatures ranging between 15°C and 25°C. The region receives moderate to heavy precipitation throughout the year, averaging between 900 mm and 1,200 mm annually, primarily from western disturbances in winter and monsoon rains from June to September. Humidity levels remain moderate to high, typically between 60% and 80%. Due to its elevation of about 1,790 m above sea level, the area often experiences fog, frost, and occasional strong valley winds. Despite these challenging conditions, the Banihal–Quazigund tunnel ensures reliable, all-weather connectivity by mitigating the impacts of snow and landslides that commonly affect higher-altitude routes

2.4 Development as per Schedule B

As per **Schedule–B (Development of the Project Highway)** of the Concession Agreement for the **Quazigund–Banihal Section of NH-44 (Km 189.350 to Km 204.700)**, the Concessionaire is required to undertake the **design, engineering, construction, and development** of the following works:

The project involves **four-laning** of the existing two-lane highway, including the construction of **two parallel tunnels**—one of **0.69 km** and another of **8.45 km** length—along with approaches and associated infrastructure. The scope of development includes:

- **Main Carriageway:** Four-lane divided highway with appropriate pavement composition and geometric standards.
- **Tunnels:** Two 2-lane tunnels with modern ventilation, lighting, fire-fighting, drainage, and safety systems.
- **Bridges and Structures:** Construction and rehabilitation of bridges, culverts, retaining and breast walls as per design requirements.
- **Drainage Works:** Longitudinal and cross-drainage systems for efficient stormwater discharge.
- **Slope Protection:** Embankment stabilization, retaining structures, and erosion control measures.

- **Roadside and Safety Works:** Provision of crash barriers, traffic signage, road markings, boundary stones, kilometer and hectometer stones, and delineators.
- **Ancillary Facilities:** Construction of toll plazas at Km 193.760 and Km 203.880, bus bays, truck lay-bys, rest areas, pedestrian facilities, and landscaping.
- **Mechanical & Electrical Systems:** High-mast and tunnel lighting, communication systems, traffic management and surveillance systems, and emergency call boxes.
- **Environmental Works:** Tree plantation, slope greening, and environmental protection structures as per the Environmental Management Plan.

All works are to be executed in conformity with the **Manual of Specifications and Standards for Four-Laning of Highways (IRC:SP-84-2009)** and the **technical specifications provided in Schedule-D**.

2.4.1 Roadway and Geometric

Exhibit 4 Roadway and Geometric

Component	Chainage (km)	Description	Specifications
Four-Lane Main Highway	189.350–193.792 & 203.865–204.700	New 4-lane carriageway connecting Banihal to Quazigund	2 × 7.5 m lanes + 2 × 1.5 m paved shoulders + 4.0 m median
Twin Tube Tunnel		**Twin Tube Tunnel**	• **Tube 1 – 8457.70 meter Tube 2 – 8463.38 meter**
Viaduct	194.236 to 195.660		• ***Viaduct of length 1526m approved by NHAI HO***
Intervening 2-lane Rigid Pavement Road	194.488–195.425	Rigid pavement between tunnels	Width: 2 × 3.75 m + 2 × 1.5 m paved shoulders

The total project length is **15.35 km**, consisting of **two tunnels (9.146 km total length)** and **6.204 km of approach and open road sections.**

2.5 Administrative details of the Project

The Concession stands granted to operate the road from the Appointed date for the concession period with the obligation on concessionaire to maintain the road in the same period. Administrative details of projects are as at Exhibit 2 below.

Exhibit 5 Administrative Details of Project

Feature	Description
Project Name	Augment the Rehabilitation, Strengthening and Four Lanning of Quazigund to Banihal Section from km 189.350 to km 205.618 of NH1A, Including 2-Tunnels (2-Lane) of 8.45 km Length on NH-1A, on DBFOT(Annuity) basis, in the UT of Jammu & Kashmir.
Mode of the Execution (BOT Toll/ BOT Annuity	BOT Annuity
Scheme / Phase	Operation, Maintenance and Transfer
No. of Lanes/ Configuration	4 (Twin tunnel 2 lane)
Length of the Project (in Km)	As per CA: 15.35 Kms Actual Construction: 16.268 Kms
Total Project Cost (in Cr)	₹1987 Crore
Annuity Bi-annually	34 installments of INR 245 Crores each, every 6 months
NH No. (New / Old)	NH 44 / NH 1A
Concessionaire	**M/s Quazigund Expressway Private Limited.**
EPC Contractor	NAVAYUGA QUAZIGUND EXPRESSWAY PRIVATE LIMITED
Independent Engineer (O&M phase)	M/S ISAN Corporation in JV with M/S Chaitanya Projects Consultancy Pvt. Ltd.
Date of Award of Work (LOA)	13.07.2010
Date of Signing of Concession Agreement	13-Jul-10
Appointed Date	05-Jun-11
Concession Period	20 years (including 5 Years construction period from appointed date)
Construction period	1825 Days

Feature	Description
PCOD Date	31.07.2021
Final Completion Date	15.12.2022
End Date of Concession period	Year 2031
No. of Toll Plazas (Number and Location)	Two (One on Banihal side and one on Quazigund side) o Lamber Toll Plaza Ch: 193+760 (7 Lanes) o Ujroo Toll Plaza m 204+563 (7 Lanes)

2.6 Salient Features of Project

Salient features of the project are covered at **Exhibit 6** below.

Exhibit 6 Salient Features of Project

Sl. No.	Particulars	As per Schedule-B	As Built
1	Project Road Start	Km 189+350 at Banihal	Km 189+350 at Banihal
2	Project Road End	Km 204+700 at Quazigund	Km 205+618 at Quazigund
3	Project Length	15.35 km	16.268 km
4	Rigid Pavement	17+1 Kms	
	Tunnel		

1	Tunnel	• **Short Tunnel** –
		  ○ Length 696 m
		  ○ From Km 193.792 to Km 194.488
		• **Long Tunnel** –
		  ○ Length 8.45 Km Single Tube Tunnel
		  ○ From Km 195.425 to Km 203.865
			• **Twin Tube Tunnel**
			• **Tube 1 – 8457.70 meter**
			• **Tube 2 – 8463.38 meter**

2	Length (Excavation) (Portal to Portal)	• **1st Tube: 8442.51m** • **2nd Tube: 8457.45 m,**	*Both tunnels relate to Vehicular cross passages at an interval of 500m*
3	Tunnel Details	• **Clearance above pavement: 5.0 meters** • **Tunnel type: Uni-directional twin tube** • **Clear width: 7.0 meters** • **Driving lane width: 3.750 meters** • **Emergency lane width: 3.250 meters** • **Tunnel height from pavement level: 8.58 meters**	

Sl. No.	Particulars	As per Schedule-B	As Built
		• **Intermediate slab height: 5.55 meters** • **Slab thickness: 200 mm**	
Twin tube solution approved by NHAI vide letter no. NHAI/BOT/11019/5/2010/QB/38 dated 26.05.2011			
5	Cross Passage	16 nos.	
6	Functional Cross Section	○ 7.0m single lane carriage way with an emergency lane, ○ Driving Lane 3.75m wide and emergency lane 3.25m wide, Vertical clearance 5.50m	
6	Firefighting and Scudder system	SCADA System, Fire Fighting system	
Structures			
1	Viaduct	1 no. Length: 1424 m	Viaduct at km 194.236 to 195.660
Viaduct of length 1526m approved by NHAI HO & conveyed vide PD's letter no. PD/SGR/14001/2014/Gen/049 dated 30.10.2014, in lieu of short tunnel T-1 (696 m length & viaduct of length 270 m)			
2	RUB (Road Under Bridge)	1 no. Length: 79.95 m	RUB on Katra-Quazigund New B.G. Railway line at Ch. 191.107 (Railway Chainage Ch. 151.710).
3	Minor Bridges	6 Nos South End- (Span-110.85 M, 22.854M, 9.940M,25M,10.82M,9.22M.)	
4	Major Bridges -	1 no. Length: 110.95 m	Four Lane Bridge across River Bichlari at Ch.189.440
5	Minor Bridges	05 nos.	
6	Culvert	20 nos. (Box Culvert)	
Misc.			
1	Toll Plaza	2 Nos. (for north side and south side traffic	Ch: 193+760 and Km 204+563 having 7 lanes

Sl. No.	Particulars	As per Schedule-B	As Built
2	Drainage pipe in tunnel Tube I	8.450 km (4 nos.)	
3	Drainage pipe in tunnel Tube II	8.450 Km (4nos.)	
4	Drainage pipe in Cross passages	32 Nos. (On both the ends)	
5	Slope Protection works at South Portal	100 mts	
6	Slope Protection works at North Portal	150 mts	
7	Lay bays	2 Nos.	
8	Firefighting Niches	66 Nos.	
9	Vehicular emergency exit	11 Nos.	
10	Ventilation Building	02 Nos.	
11	Tunnel Control Centre (Building)	02 Nos.	
12	Toll Plaza Building	02 Nos	

Exhibit 7 Tunnel Layout

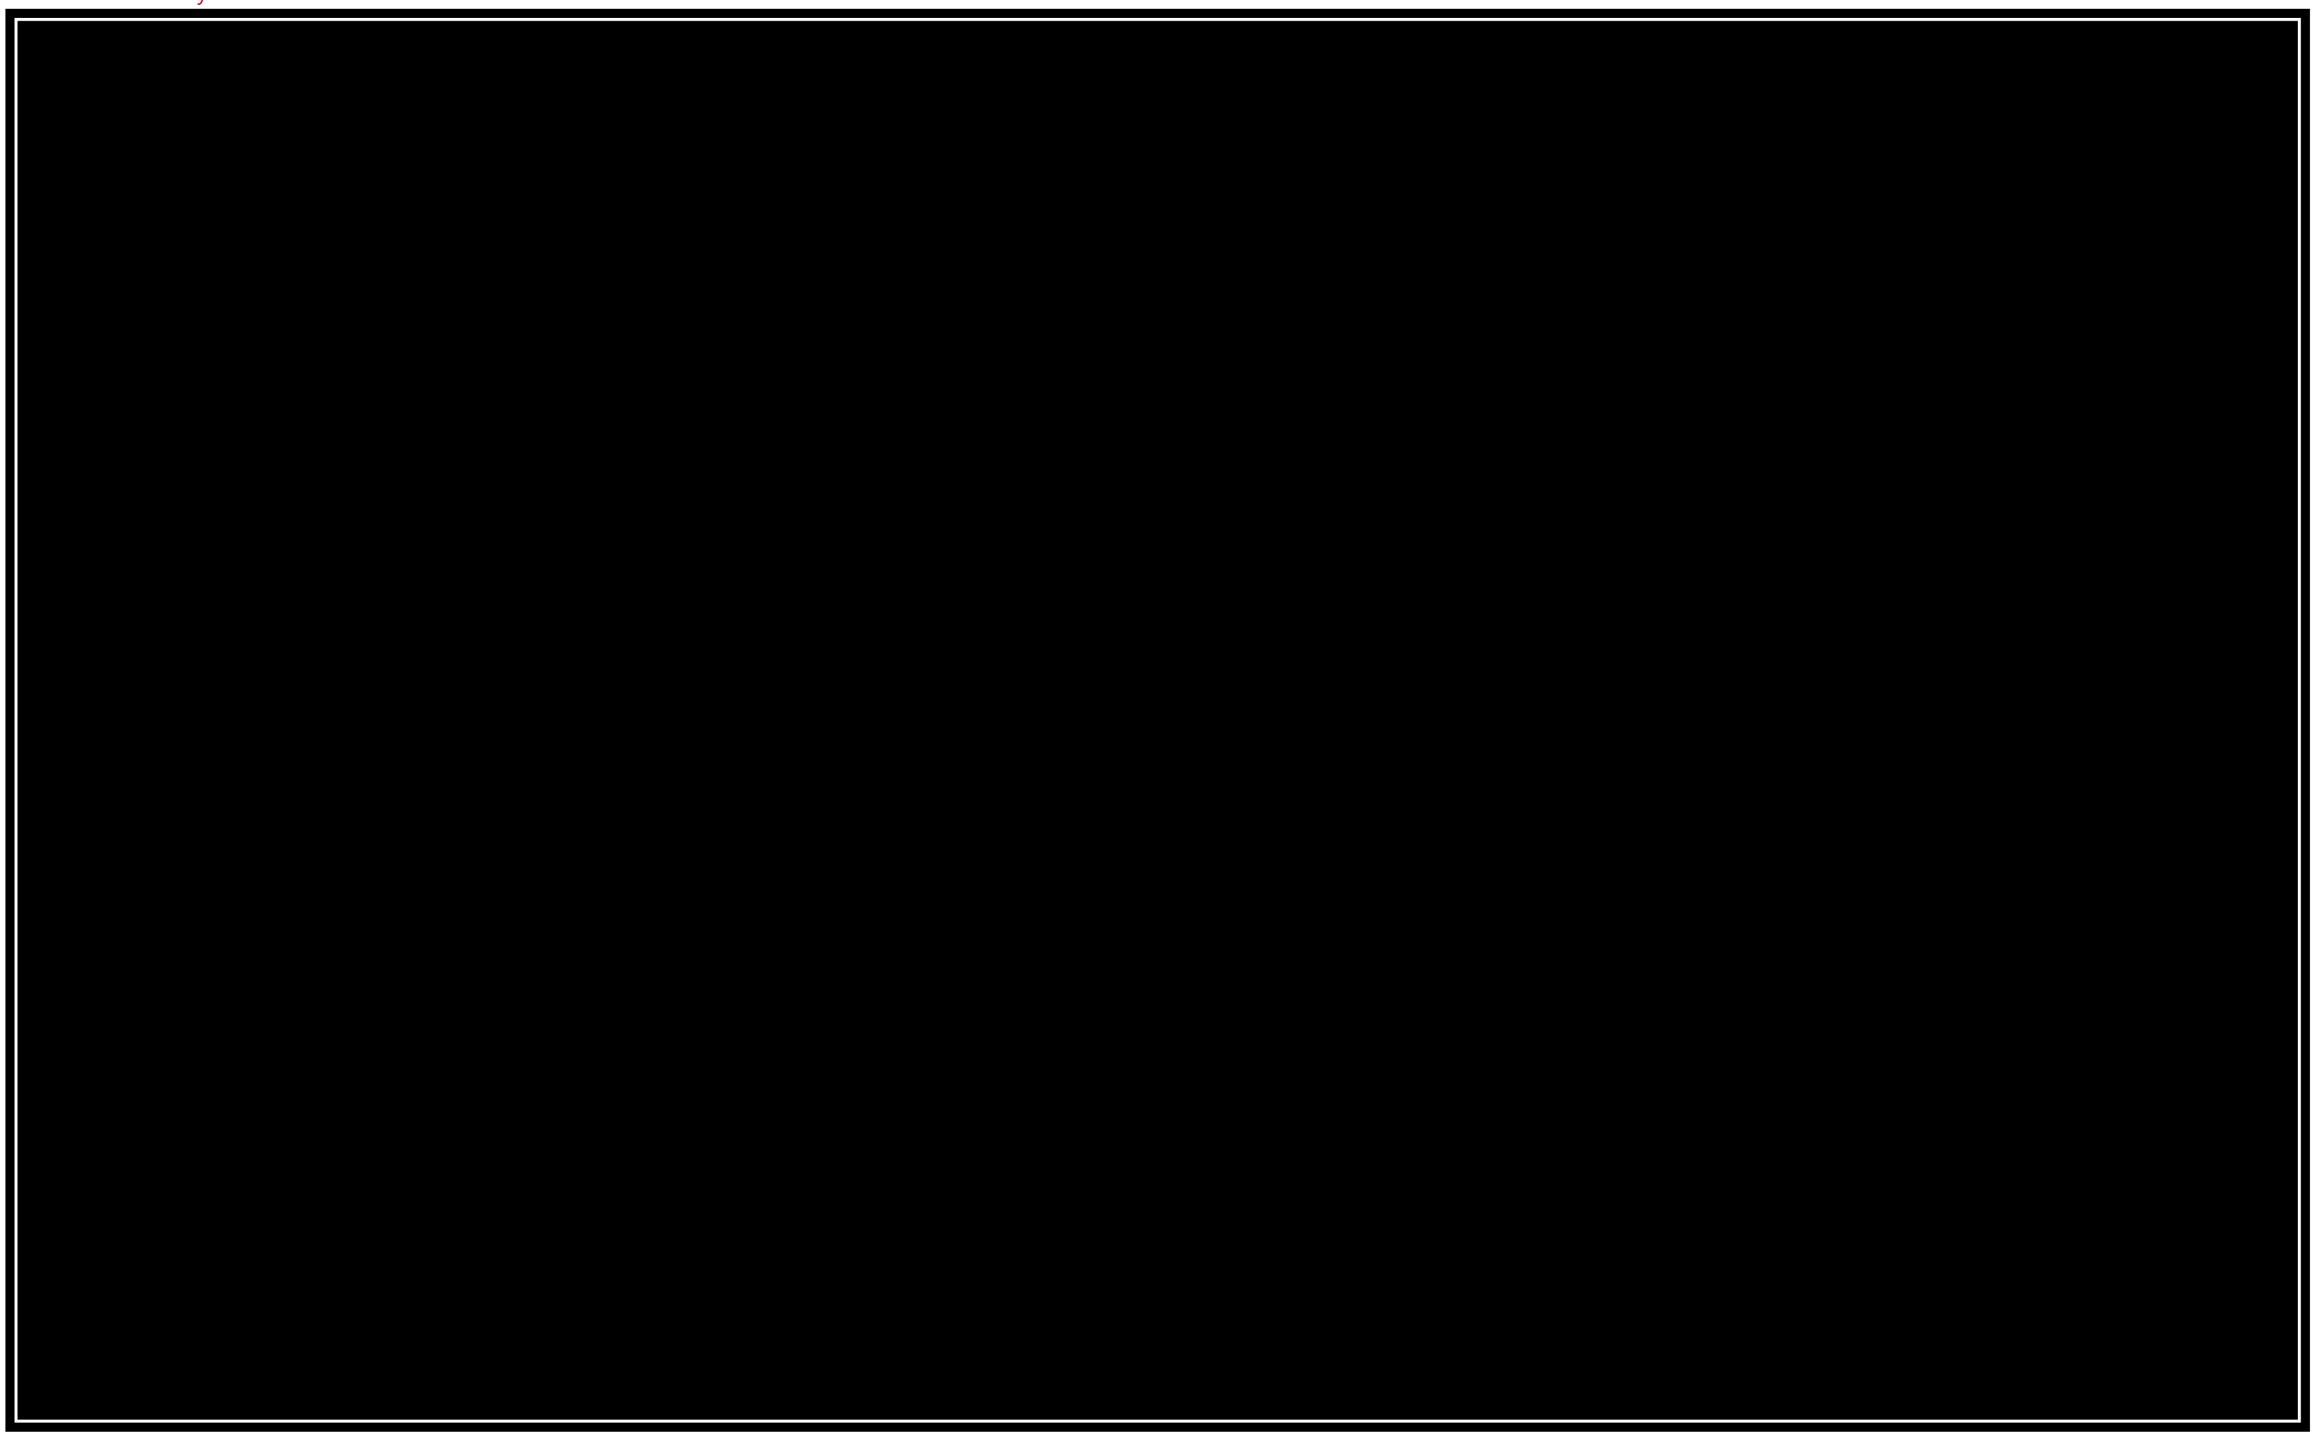


Exhibit 8 Vehicular Cross Passage Details

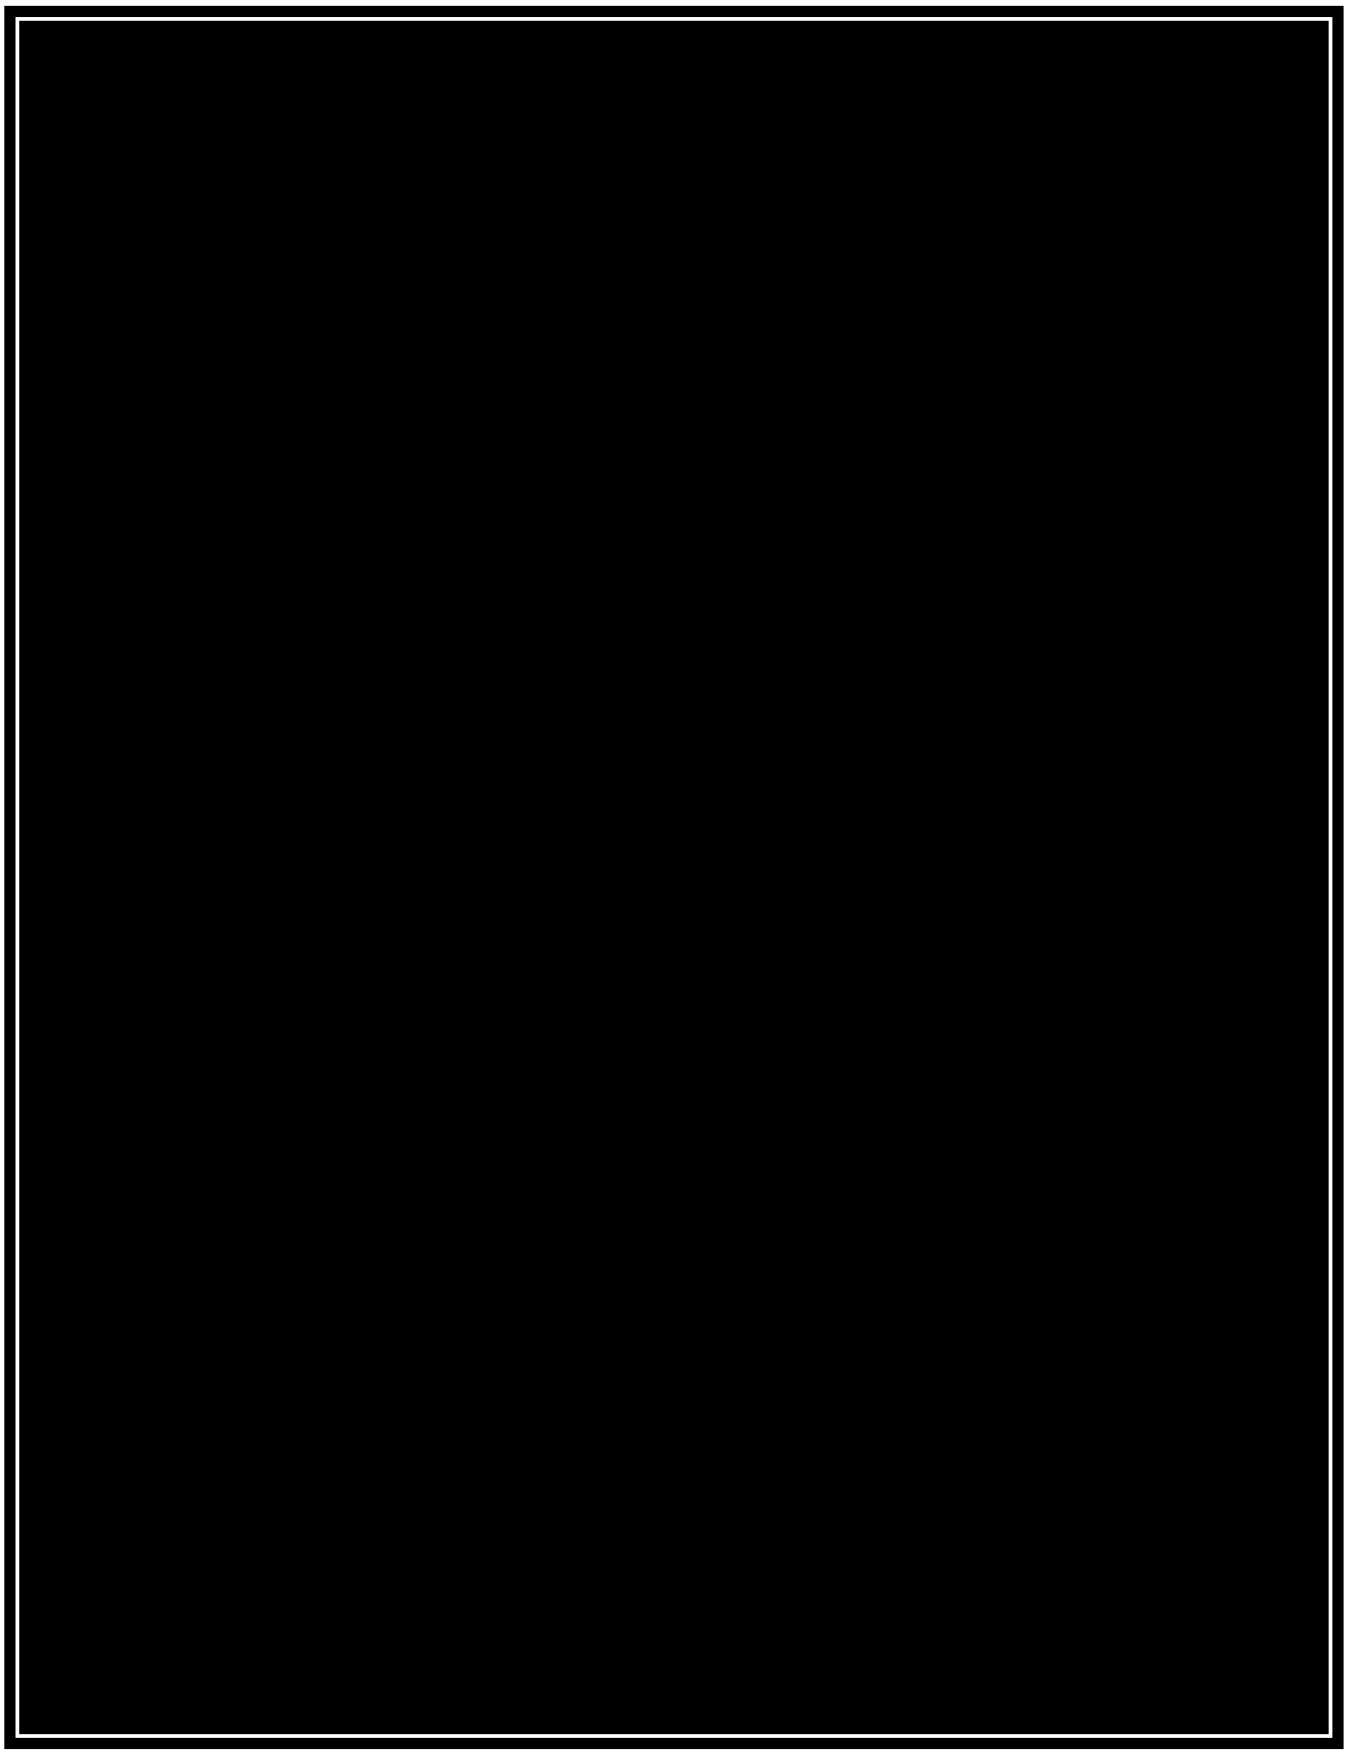

Exhibit 9 Electrical Cross Passage Details

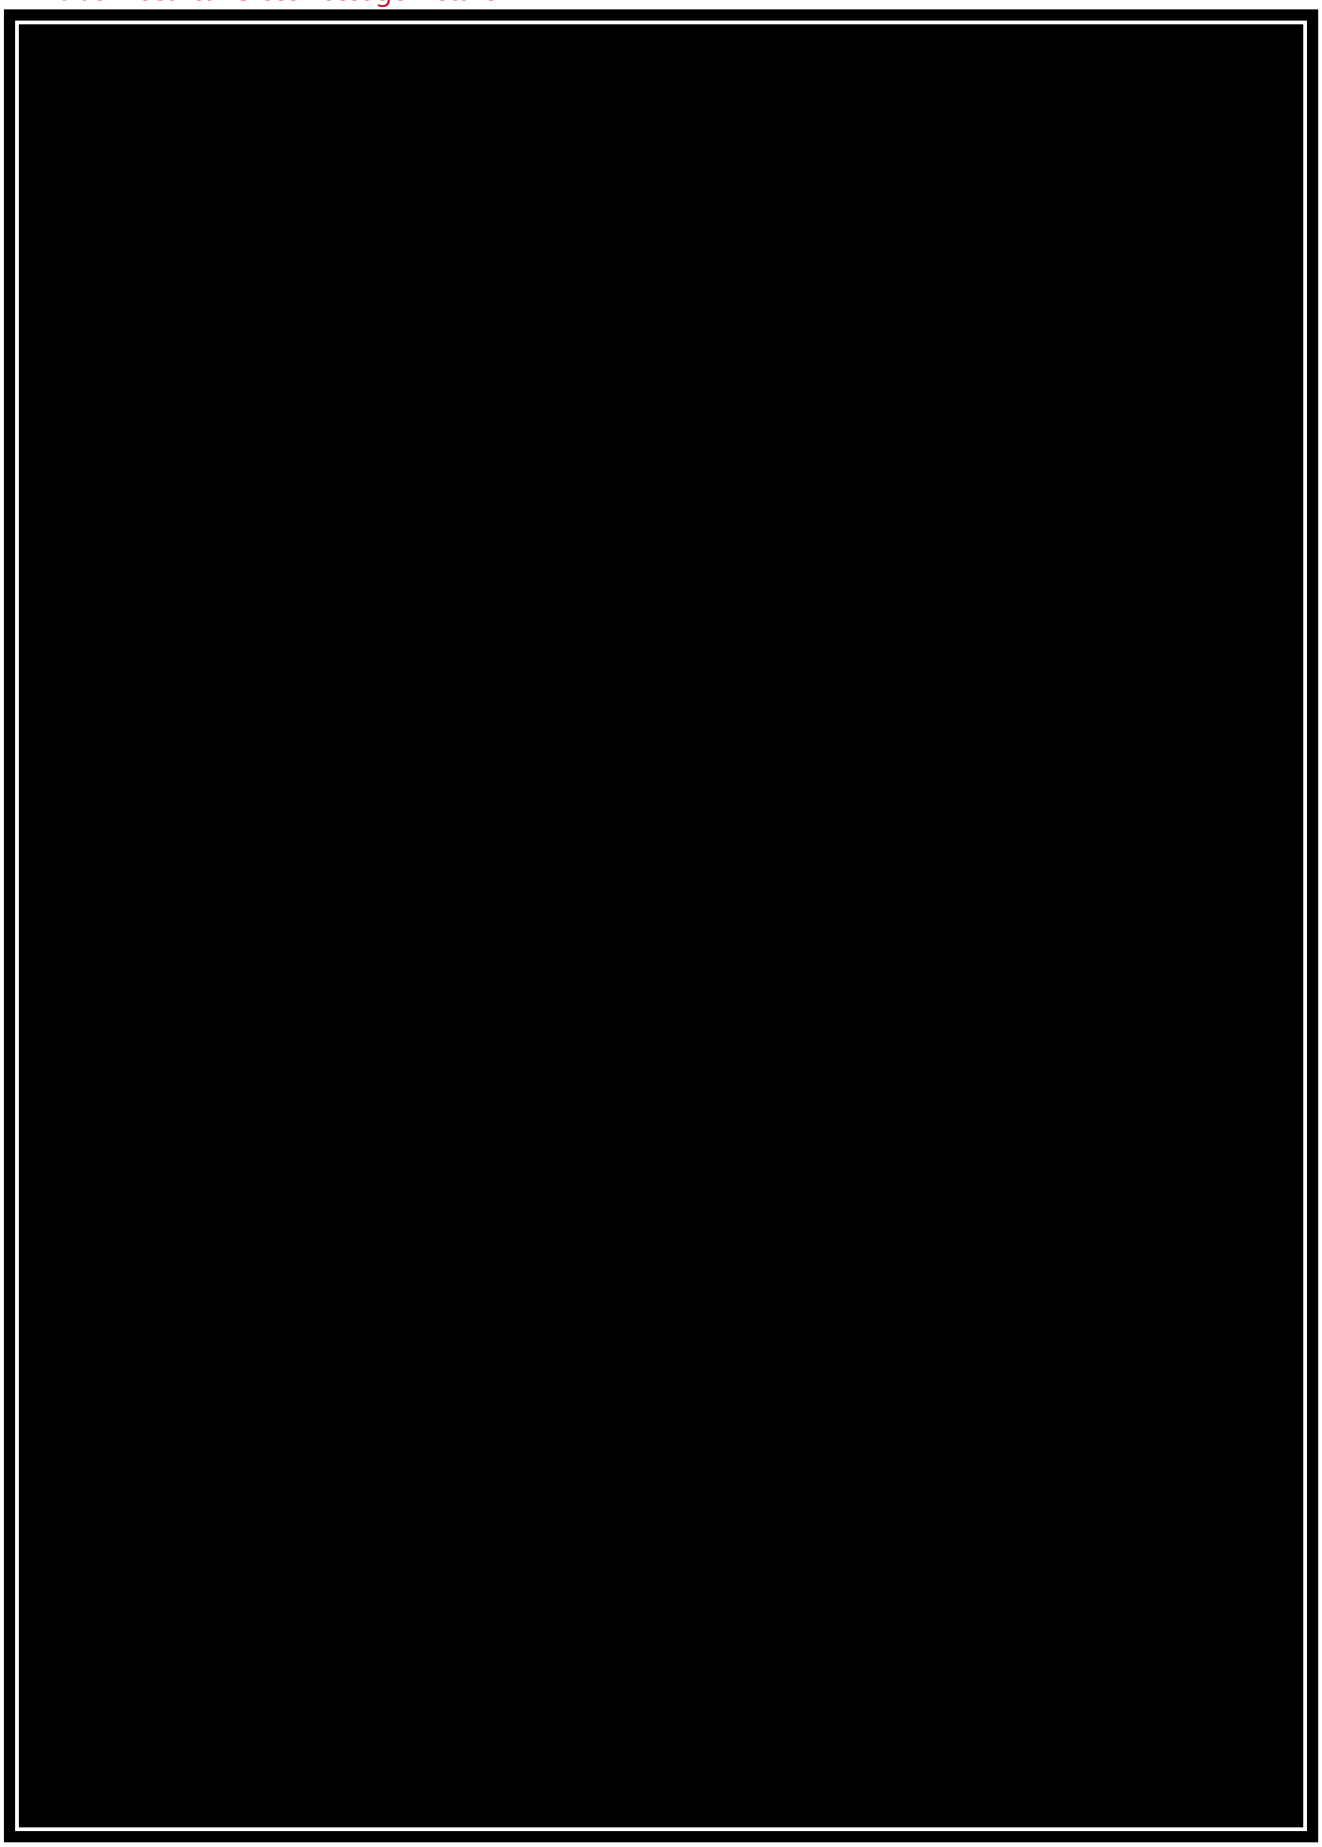


2.7 Project Completion Certificate and PCOD & FCOD

A. Partial Commercial Operation Date (PCOD):

- The scheduled completion date was 31.072021.

B. Final Commercial Operation Date (COD):

- The IE issued the Completion Certificate on 15.12.2022.

2.8 Annuity Details

As per the Concession Agreement, an annuity amount of ₹201.90 crore is payable every six months. To date, a total of 22 annuity payments have been made by the Authority. The detailed breakdown of these annuity payments is provided below

Exhibit 10 Details of Annuity Payments

Sr. No.	Annuity	Annuity Due On	Amount Claimed	Ded. by IE	Annuity Received	Remarks
1	1st Annuity	30-07-2022	245	0	245	
2	2nd Annuity	30-01-2023	245	0.34	244.66	Deduction for Descope items
3	3rd Annuity	31-07-2023	245	0	245	
4	4th Annuity	30-01-2024	245	0.38	244.62	Deduction for Maintenance works
5	5th Annuity	30-07-2024	245	0	245	
6	6th Annuity	30-01-2025	245	0	245	
Total Amount (₹-Crore)			**1470**	**0.72**	**1469.28**	
Deduction (%)				**0.05%**		

Based on the above, Knight Frank is of the view that the total deductions of just ₹0.72 crore across six annuity payments—including ₹0.35 crore for descoped items—indicate the concessionaire's consistently high standard of maintenance over the three-year project period

2.9 Extension of Time

There is no extension of time for the concession period on the project

2.10 Penalty

There is no penalty on project as of now.

2.11 Approvals & Permits

Since Project is in O & M stage therefore all necessary approvals required are in place with concessionaire.

2.12 Change of Scope

As informed, the Concessionaire submitted a cost estimate for street lighting along the viaduct and highway section between Km 193+600 and Km 195+366 via letter no. NQEPL/1239/JK/21-22/300 dated 06.09.2021 to the then Independent Engineer under the Change of Scope (CoS). The Independent Engineer provided comments on the proposal to the Authority through letter no. CPC/OM-03/2021/HO/GEN/015/4642 dated 12.01.2022. Subsequently, the Contractor referred the matter back to the Independent Engineer through letter no. NQEPL/1239/JK/21-22/402 dated 24.01.2022. Following further review, the Change of Scope proposal was recommended to the Authority via the Independent Engineer's letter no. CPC/OM-03/NQE/2021/HO/CON/049/5960 dated 04.05.2022.

2.13 Power Availability of Project

Exhibit 11 Power Details of Project

Location	DPR Status	33KV Line	33/11 KV Substation	Remarks
Status 33/11kv sub-station (permanent)				
North Portal	Approved	23 Kms from Wanpoh Anantnag Grid, work under progress	12.5MVA capacity (OLTC AVR, with +45% to -3% voltage correction)	Substation work completed
South Portal	Approved	3 Kms from nearest Grid (line installed). To be extended by 1 Km to SPVB permanent station later	Proposed 12.5MVA OLTC AVR, with +45% to -3% voltage correction	Concessionaire should approach NHAI for further course of action
Present Power availability.				
North Portal	Local receiving station at Hiller (Augmented to 10MVA). Independent power transformer for tunnel uses with automatic voltage correction up to 15%.	At 11KV level (dedicated line), 2 KM line length, Dog (100mm^2) conductor installed and commissioned.	From Local Area 33/11KV Sub-Station	In use for tunnel equipment operation till permanent 12.5MVA station is in place.
South Portal	3.15MVA (Augmented to 10MVA) with 15% voltage correction.	At 33KV level (dedicated line), 11KV line with 2X50 sqmm conductor used for overhead line from 33/11KV Sub-station to SPVB	From Tethar 80MVA, 33/11KV Substation	In use for tunnel equipment operation till permanent 12.5MVA station is in place.

☛ **Currently, both North and South Portals are operating on temporary power arrangements using augmented substations (10MVA) with voltage correction. While the permanent 12.5MVA substations are either completed or proposed, they are not yet commissioned for operational output. Timely commissioning and coordination with NHAI are essential to ensure uninterrupted long-term power supply for tunnel operations.**

2.14 Special Features of Project

Each tunnel tube ensures uninterrupted traffic flow, featuring a 3.75-meter-wide main carriageway and a 3.25-meter-wide emergency lane, which is designated for use during vehicle breakdowns and rescue operations.

An Integrated Tunnel Control System (ITCS) has been implemented to oversee and manage various tunnel facilities and utilities. The ITCS includes:

1. Monitoring and control of traffic management systems inside and outside the tunnel.
2. Monitoring and control of the tunnel's ventilation systems.
3. Monitoring and control of the power supply systems within and outside the tunnel.
4. Monitoring of the emergency call system within the tunnel.
5. Monitoring of the Linear Heat Sensing System inside the tunnel and the fire alarm system in external buildings.
6. Monitoring and control of video surveillance systems both inside and outside the tunnel.

2.15 Tunnel Safety and Operations Systems Overview

- ***Traffic Control System***

The Traffic Control System includes traffic lights, message signs, and road signs positioned at the north and south roundabouts, tunnel portals, and inside the tunnel. These components regulate traffic under normal, congested, and emergency conditions. All traffic devices are monitored and operated using Programmable Logic Controllers (PLCs) through the Integrated Tunnel Management System (ITMS), with both automatic and manual operation modes available.

- **CCTV Monitoring & Video Surveillance**

The CCTV system monitors vehicle movement and road conditions inside and around the tunnel. It supports live viewing, recording, and playback functionalities.

  - Fixed cameras installed inside the tunnel enable incident detection.
  - Rotating cameras are positioned 50 meters before each portal.
  - A traffic counting system is integrated with the video feed.
  - Automatic Incident Detection is included.
  - All devices are connected via CAT6 on a TCP/IP network, managed through a Video Management System (VMS).
  - The system provides server redundancy and 24-hour recording capacity.

- **Linear Heat Sensing (LHS) and Fire Alarm System**

- LHS systems with optical sensors are installed in both portals, control rooms, and ECP LV rooms.
- Evaluation units trigger zone alarms, interfaced with the ITCS SCADA system via Modbus.
- Addressable fire alarm panels are located in the north and south control rooms and admin buildings.
- Conventional smoke detectors are installed in ECP LV rooms at ~1.5 km intervals and connected via RIOs using hardwired NO/NC contacts.

- **Emergency Communication System (ECS) & Public Address (PA) System**
  - SOS call boxes are installed every 250 meters along the emergency lanes within the tunnel.
  - The system allows verbal communication between tunnel users and operators. All calls are recorded and stored for 30 days.
  - PA speakers with noise-sensing microphones are located in ECP LV rooms and buildings to broadcast emergency or general messages.

- **Networking Infrastructure**

The tunnel network is structured in three rings:

- **Major Ring**: Four core switches (two each at Main Control Centre and Backup Control Centre), configured with redundancy protocols.
- **Sub Rings**: Two rings connecting MCC and BCC via ten distribution (aggregation) switches to ensure continuity even if a cross-passage is down.
- **Access Rings**: Eight rings (four per tunnel side) connecting SOS points via access switches (E1–E34), ensuring localized failure does not disrupt the entire network.

- **Telephone System**

The telephone network facilitates emergency communication between Tunnel Control Centre (TCC), Backup Control Centre (BCC), and tunnel staff at ECP LV rooms. It remains operational during fire events and supports emergency coordination.

- **Rigid Height Barriers**

Rigid height restriction barriers are installed at:

- South Portal railway junction
- Junction near the North Portal

These prevent entry of oversized vehicles into the tunnel.

- **Ventilation System**

A combination of semi-transversal and longitudinal ventilation systems is installed to ensure safety and air quality. Key functions include:

- Smoke control and safe evacuation during fire events
- Maintaining visibility and clear escape routes
- Effective smoke extraction during firefighting

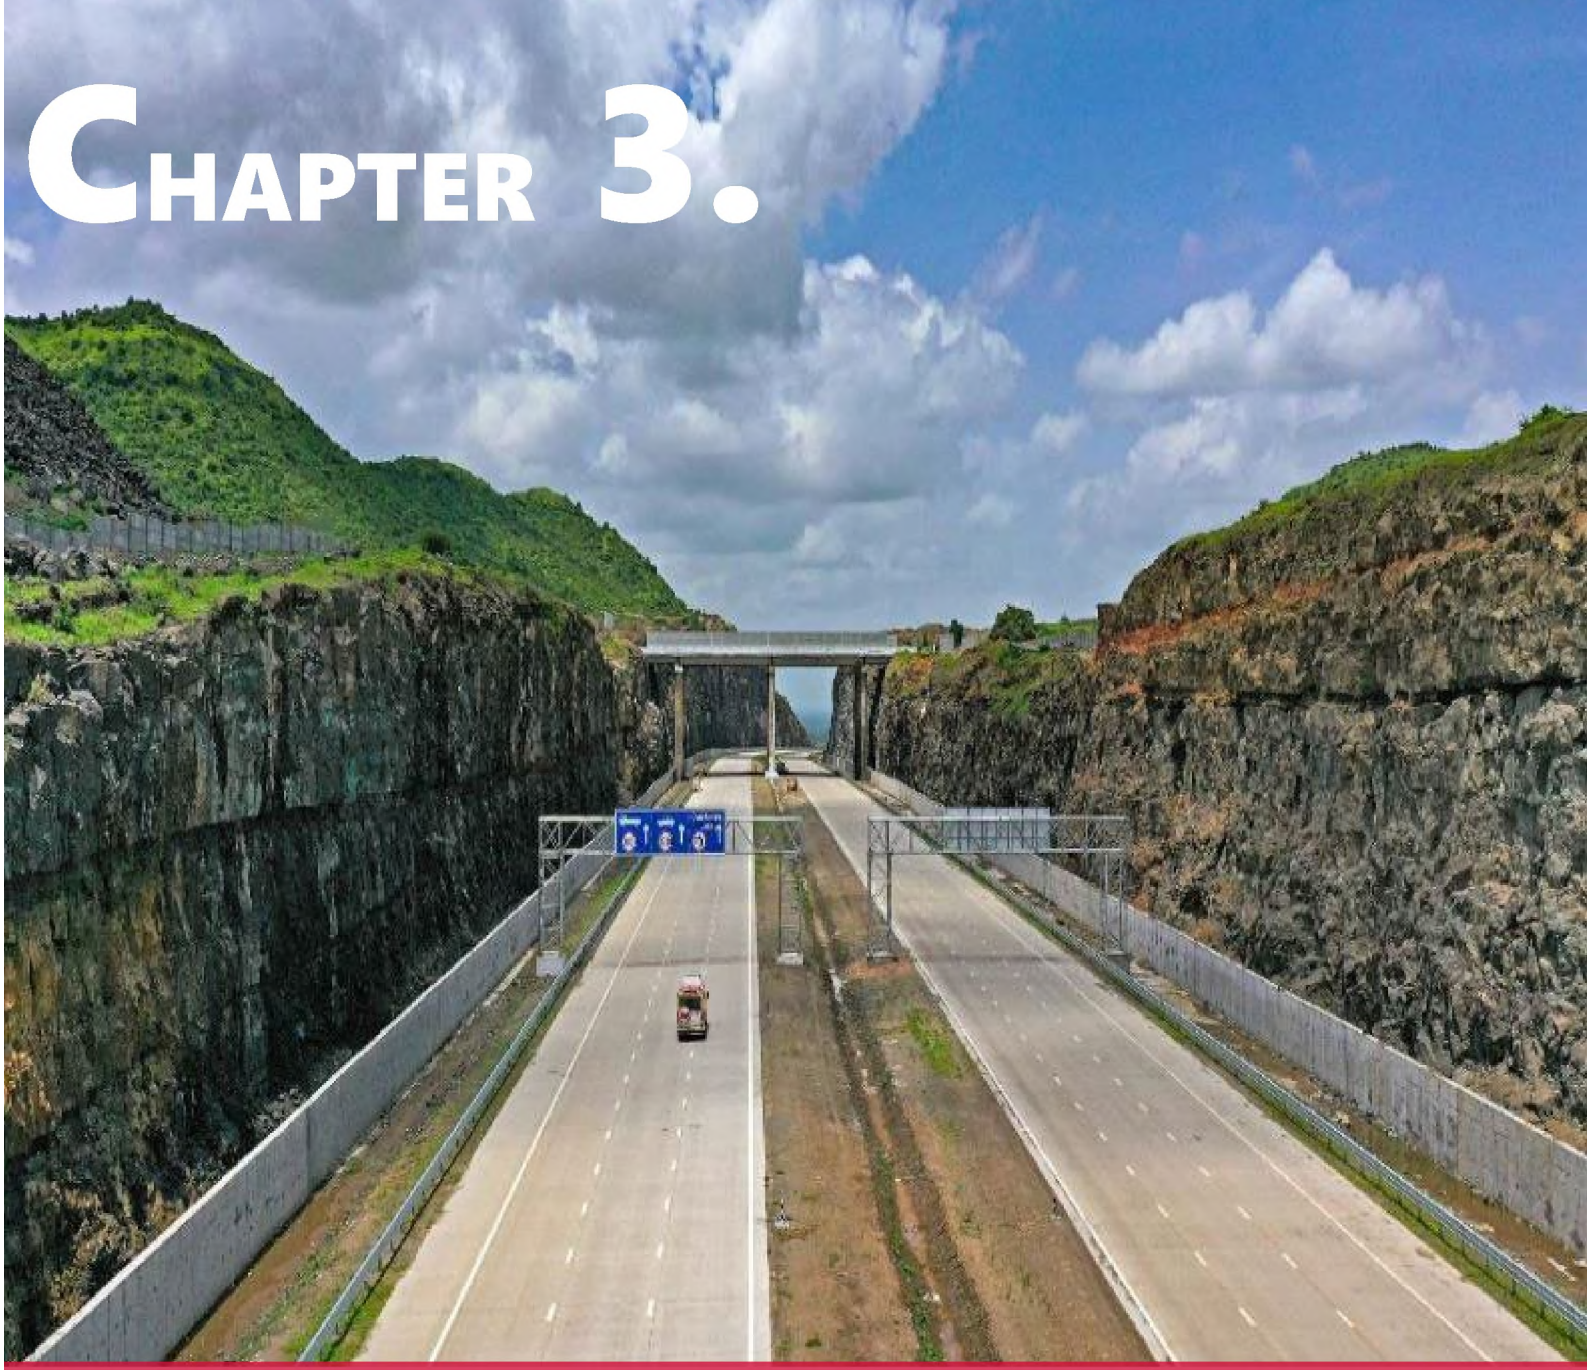
The system is designed to manage a fire heat release rate of 50 MW (as per HBI Technical Report I6007-13-R-04/01 – 04/00).

During early fire stages, smoke stratifies and spreads bi-directionally at ~1–2 m/s. After 5 minutes and at ~600 m from the source, smoke cools, descends, and reduces visibility if not ventilated.

KF View:

The tunnel is equipped with a comprehensive, integrated safety and operations system including traffic control, surveillance, emergency response, ventilation, and communication networks. These systems are designed with redundancy, automation, and real-time monitoring to ensure uninterrupted tunnel operations and quick response in case of emergencies, thereby enhancing safety, reliability, and user experience.

Chapter 3.



Review of Project Agreements

Chapter 3. REVIEW OF PROJECT AGREEMENTS

3.1 Review of Concession Agreement

The Concession Agreement was executed between NHAI and Navayuga Quazigund Expressway Pvt. Ltd. (NQEPL) on 13 July 2010 for Rehabilitation, Strengthening and Four-Laning of the Quazigund–Banihal section of NH-1A from Km 189.350 to Km 204.700, including two tunnels (≈0.69 km and 8.45 km) on a DBFOT (Annuity) basis under NHDP in the Union Territory of Jammu & Kashmir.

Exhibit 12 Key Terms of Concession Agreement

Particulars	Description
Date of Agreement	13 July 2010 (execution following LOA dated 30.04.2010).
Appointed Date	05 June 2011
Employer	NHAI (National Highways Authority of India)
Concessionaire	Quazigund Expressway Private Limited (NQEPL).
Concession Period	**20 years** from Appointed Date, covering construction, O&M, and eventual transfer
Length of the Project, Total project Cost	Length of Project: 15.35 km stretch including 2 tunnels (0.69 km & 8.45 km) Total Project Cost **₹2070 crore**.
Achievement of Project Milestones	Linked to Right of Way & completion schedule. **Project Milestones – Quazigund–Banihal CA (Schedule G)** The project has a **5-year (1825 days) construction period** from Appointed Date. Milestones are defined with deadlines and minimum expenditure thresholds of the **Total Project Cost (TPC)**.
Construction Period/ Scheduled completion date	• **1825 days (5 years) from Appointed Date.** • 04 June 2016
Premium / Fee	Concession Fee obligations exist (Art. 26), but **no toll right**; revenue is **Annuity** (Art. 27)

Particulars	Description
Annuity Payment	₹245 crore per half year, payable by NHAI to Concessionaire post COD
Performance Security	**₹99.35** crore Bank Guarantee, valid until 1 year from Appointed Date; replenishable if encashed
Extension of Time COD	Allowed in case of **Force Majeure** (Article 34) or **Authority default** (delays in ROW, approvals).
Escrow	**Escrow Account** before Appointed Date; deposits include **Financial Package, Annuities, other revenues/receipts**; detailed in **Article 31/Schedule-S.**
PCOD	The **Provisional COD was achieved on 31 July 2021**. It was recognized formally in the **Settlement Agreement dated 24 June 2022**, after RO Jammu recommended EOT till 30 June 2021.
FCOD	The **Final COD was achieved and certified on 15 December 2022**. This milestone was formally recorded in the **Supplementary Agreement dated 10 November 2023**.
Respective rights and obligations of the Parties	NHAI: ROW, support, annuity payment. Concessionaire: DBFOT design, construction, O&M, financing
Change in Ownership	**Equity lock-in (≥51% for construction period + 2 years' post-COD)**
Dispute Resolution Process	Tiered: conciliation (Article 44.2) arbitration (Article 44.3) under Arbitration Act, 1996.
Governing Law and Jurisdiction	Agreement governed by Indian Law; jurisdiction vested with Delhi courts. (**Article 47**).

3.1.1 Obligations of the Authority & Concessionaire

Exhibit 13: Key Obligations of Parties

Authority	Concessionaire
Provide Right of Way (ROW) for the Project Highway, free from encumbrances	Design, engineer, finance, procure, construct, operate, and maintain the Project Highway on DBFOT (Annuity) basis
Assist in obtaining statutory approvals, permits, and clearances from Government authorities	Achieve Financial Close within 180 days (extendable with damages) and furnish Performance Security
Pay annuity of ₹201.90 crore (half yearly) post COD, as per Article 27	Maintain the Project Highway in accordance with Specifications, Standards, and O&M requirements (Schedule K)
Maintain existing highway during the development period until Appointed Date	Comply with safety requirements, traffic regulations, and emergency response obligations
Provide assistance for utilities shifting, police support, medical aid posts, and land acquisition (if required)	Ensure timely achievement of project milestones and Scheduled Completion Date (COD within 1,095 days of Appointed Date)
Not levy any additional local tax/toll on the Project Highway	Hand back the Project Highway to NHAI at the end of Concession Period or upon termination, free of encumbrances
Cooperate with Independent Engineer for monitoring construction and O&M	Bear project risks, costs, and liabilities, except as specifically allocated to NHAI under the Agreement

3.1.2 Financial Provisions and Settlements:

The Agreement (Articles 28, 29; Schedules L & R) sets out strict financial safeguards to protect cash flows and lender interests. All revenues and annuities flow through an escrow with defined payment priority, equity is locked in to ensure sponsor commitment, and lenders hold substitution rights in case of default. Provisions on insurance, change in law, and regular financial reporting further enforce financial discipline. **The detailed covenants are presented in the exhibit below.**

Exhibit 14: Key Financial covenants detail

Aspect	Details
Escrow Account	All project-related revenues, including annuity payments from NHAI, insurance proceeds, and any other receivables, are deposited into a designated **Escrow Account** maintained with an Escrow Bank. Disbursements follow a defined priority sequence: (i) statutory dues, (ii) O&M expenses, (iii) senior debt servicing, (iv) reserve creation, and (v) equity returns/distributions. *(Ref: Article 31, Schedule S)*
Annuity Payments	The project operates on a **DBFOT (Annuity)** basis. NHAI pays a **fixed semi-annual annuity of ₹245 crore** to the Concessionaire for **20 years from COD/PCOD**, irrespective of traffic volume. Payments are routed through the **Escrow Account**, with deductions only for **O&M or lane-availability shortfalls**, as per **Article 27 and Schedule M**.
Toll Fees	The Concessionaire has **no right to collect tolls** from road users. Under **Article 25**, the right to levy and collect tolls rests with **NHAI**, which may collect directly or through its appointed agencies under the **National Highways Fee Rules, 2008**. The Concessionaire's revenue stream consists solely of **annuity payments**, making it **traffic independent**.
Debt Service Coverage	Senior lenders have **first charge** over project cash flows routed through the Escrow Account. In the event of a shortfall in debt servicing, the Concessionaire is required to provide **sponsor support** until sufficient project cash flows are achieved post-COD.
Equity Lock-In	The lead sponsor is required to maintain a **minimum 51% equity shareholding** in the Concessionaire during the **construction period** and for a further **two years post-COD**, unless otherwise approved by NHAI. *(Ref: Article 5.2.5)*

Aspect	Details
Change in Law Compensation	Under **Article 41 (Change in Law)**, if any legislative or regulatory change materially impacts project costs or revenues, the affected party is compensated to maintain **financial neutrality**. Compensation is determined on a **Net Present Value (NPV)** basis and may be implemented through **annuity adjustments or concession period extensions**.
Revenue Shortfall Loan	Not applicable. The Concession Agreement does **not provide for a Revenue Shortfall Loan**, as the project's annuity structure ensures fixed payments from NHAI irrespective of traffic performance.
Total Project Cost (TPC)	The **Indicative Project Cost** defined at the Invitation for Qualification (IFQ) stage is **₹1,987 crore**, used for determining limits for Change of Scope (COS) and related financial covenants. *(Ref: Article 48.1)*
Insurance	The Concessionaire must maintain comprehensive **insurance coverage** for construction, third-party liability, O&M, and force majeure events, naming **NHAI and lenders as co-insureds**. Certificates must be furnished periodically as per **Article 32**.
Substitution Rights	In case of persistent Concessionaire default, **lenders have the right to substitute** the Concessionaire with a nominated entity under a **Substitution Agreement (Schedule R)**, ensuring continuity of operations and debt protection.
Financial Reporting	The Concessionaire is required to submit **periodic financial statements, progress reports, and audited accounts** to **NHAI and lenders**, in compliance with Articles **29 and 33** of the Concession Agreement.

3.1.3 Delay Damages and Penalties under the Concession Agreement

Exhibit 15: Key Terms of Damages/ Penalty

Clause / Article	Situation	Damages / Penalty	Remarks
Clause 4.2 & 10.3	Delay by Authority in providing Right of Way beyond 90 days from Appointed Date	₹50 per day per 1,000 sq. m. of land delayed	Payable to Concessionaire until ROW is given
Clause 4.3 & 24.1	Delay by Concessionaire in achieving **Financial Close** within 180 days	0.1% of Performance Security per day (extendable up to 120 days); further extension possible at 0.2% per day; max 20% of Performance Security	Weekly advance payment required for extension
Article 15.2 (COD Delay)	COD not achieved within 91 days after Scheduled Completion Date (Appointed Date + 1095 days)	0.1% of Performance Security per day until COD	If not achieved within 270 days, Authority may terminate
Article 17.7.3 (Lane Closure)	Delay in reopening lanes after repair/maintenance	0.1% of Average Daily Annuity per 250 m stretch/day	Independent Engineer approval required for closures
Article 35 (Compensation for Breach)	Breach by Concessionaire or Authority (other than those with specified damages)	Compensation = direct costs incurred by non-defaulting party	Does not include consequential losses
Article 49 (Transitional Arrangements)	Delay in completing Affected Stretch (wildlife clearance pending) beyond 180 days after Scheduled COD	₹57,250 per day	Recoverable by deduction from annuity

3.1.4 Legal and Operational Framework:

- **Force Majeure Events:**
    - Covers natural events, political events, and indirect events.
    - Relief is available only if reported within 7 days.
    - Time extensions granted for achievement of milestones and COD.
    - Compensation limited to actual costs, no claim for indirect losses.
- **Compensation for Breach of Agreement**
    - Sets principles for damages due to breach.
    - Damages are pre-estimated, not penalties.
    - Both parties are obligated to mitigate costs/losses.
- **Termination:**
    - Covers natural events, political events, and indirect events.
    - Relief is available only if reported within 7 days.
    - Time extensions granted for achievement of milestones and COD.
    - Compensation limited to actual costs, no claim for indirect losses.
- **Divestment of Rights and Interest**
    - On termination, Concessionaire must hand over project assets free of encumbrance.
    - Obligations include O&M records, designs, clearances, contracts, and project facilities.
- **Defects Liability after Termination**
    - Concessionaire remains liable for construction defects discovered post-termination.
    - Liability period typically one year from termination/transfer date.

3.2 Review of Supplementary Agreements

The **Concession Agreement of 13.07.2010** was modified through **four Supplementary Agreements** and one **Annex Undertaking**. The first, dated **27.06.2011**, revised termination payment provisions under Force Majeure, clarifying payout formulas linked to Debt Due and Insurance Cover, thereby strengthening financial transparency and lender assurance. The second, dated **25.08.2014**, approved tunnel design modifications to twin unidirectional tubes and redefined cost responsibilities, ensuring project continuity without altering concession terms. The third, dated **06.10.2020**, partially modified the 2018 Settlement Agreement by restructuring timelines and confirming the ₹575 crore advance repayment terms. The fourth, dated **10.11.2023**, formally recorded project completion milestones and corporate restructuring, while the **Annex-2 Undertaking** dated **08.11.2023** reaffirmed the concessionaire's commitment to complete all residual works. Together, these agreements enhanced contractual clarity, reinforced financial stability, and ensured smooth transition from construction to operation.

Exhibit 16: Summary of Supplementary Agreements

Date	Parties	Purpose / Context	Key Terms / Amendments
27 June 2011	NHAI & Navayuga Quazigund Expressway Pvt. Ltd.	***Supplementary Concession Agreement (Termination Clauses)***	•Amended **Article 34.9** concerning termination payments during Force Majeure events. Clarified financial compensation for **Non-Political**, **Indirect Political**, and **Political** Force Majeure. • Non-Political FM: payout = **90% of Debt Due minus Insurance Cover**. • Established clear termination formulas improving **lender protection** and **financial certainty**.
25 August 2014	NHAI & NQEPL	***Second Supplementary Agreement – Viaduct and Twin Tunnel Design Modification***	• Approved alternate tunnel configuration: **twin unidirectional tubes** (8.45 km and 0.69 km). • Tunnel component constituted ~**86%** of total civil cost; redesign added ~₹207 crore (~10% of TPC). • Concessionaire agreed to **bear entire additional cost**, exceeding the 5% COS threshold. • Improved **safety and operational efficiency**; minor time extension allowed for design approval and execution.
6 October 2020	NHAI & NQEPL	***Supplementary Agreement – Modification of 2018 Settlement***	• Adjusted timelines following construction delays and fund infusion. • Revised interim completion date to **10 July 2020** (from 31 December 2019).

Date	Parties	Purpose / Context	Key Terms / Amendments
			• Confirmed interest on **₹575 crore advance** at **Bank Rate + 2% p.a.** • Both parties waived pending claims upon achieving COD within revised timeline. • Ensured continued project funding and completion certainty.
8 November 2023	Quazigund Expressway Pvt. Ltd. (formerly NQEPL) → NHAI	***Annex-2 Undertaking***	• Concessionaire undertook to **complete all pending punch-list and maintenance items** identified by the Independent Engineer. • Committed to completion within stipulated timelines. • Served as **final compliance assurance** during transition to O&M phase.
10 November 2023	NHAI & Quazigund Expressway Pvt. Ltd.	***Post-Completion Supplementary Agreement***	• Formally acknowledged **project completion** and **corporate restructuring**. • Recorded milestones: Appointed Date – **05 June 2011**; EOT – **30 June 2021**; PCOD **31 July 2021**. COD **15 December 2022**. • Confirmed transition from construction to full O&M phase and validated revised schedules.

3.3 Review of State Support Agreement

The **State Support Agreement** was executed on **28th November 2011** between:

- **The Governor of Jammu & Kashmir** (the *State Government*), acting through the **Public Works Department (PWD)**, and
- **The President of India**, represented by the **Ministry of Road Transport & Highways (MoRTH)** and the **National Highways Authority of India (NHAI)** (the *Authority*).

This agreement provides the framework for **State Government support** to ensure the **smooth implementation, operation, and maintenance** of the **Quazigund–Banihal Highway Project** under the **Concession Agreement dated 13 July 2010** between NHAI and **Navayuga Quazigund Expressway Pvt. Ltd. (NQEPL)**.

Exhibit 17: Key Terms of the State Support Agreement

Parameter	Details
Date of Agreement	28th November 2011
Parties	The Governor of Jammu & Kashmir (State Government) & The President of India (Authority), represented by MoRTH/NHAI
Purpose	To provide State Government support and facilitation for the implementation and operation of the **Quazigund–Banihal Highway Project** under the **DBFOT (Annuity)** model
Support by State Government	• Provide continuous **Right of Way (ROW)** and unhindered site access.• Assist in obtaining all **applicable permits, clearances, and local approvals**.• Facilitate **utility shifting** (electricity, water, telecom, etc.).• Ensure **no local levies, barriers, or municipal taxes** are imposed on the project highway.• Provide **police support** for traffic control, removal of encroachments, and ensuring project security.• Establish **traffic aid posts, mobile patrol units, medical aid posts, and ambulance services** as per government standards.
Restriction on Competing Roads	The State shall not develop or permit any **competing road or Tollway** that adversely affects project traffic, except as allowed under the Concession Agreement and with annual notification to NHAI.
Restriction on Additional Tollways	No additional or parallel Tollway to be constructed except as permitted by the Concession Agreement.

Parameter	Details
Restriction on Local Taxes	The State Government shall not impose **local tolls, taxes, or levies** on the project highway; however, existing State revenue interests at **Lakhanpur and Lower Munda** shall remain unaffected.
Substitution of Concessionaire	The State acknowledges the **lenders' and Authority's rights** to substitute the Concessionaire in the event of persistent default, as per the Substitution Agreement (Schedule-R of CA).
Obligations of Authority	The Authority shall ensure that the Concessionaire **complies with applicable laws, permits, and the Concession Agreement** in coordination with the State Government.
State Default	Failure by the State Government or its agencies to **cure a breach within 60 days** of notice constitutes **State Default**, treated as a breach under the Concession Agreement.
Compensation & Termination Payments	The State Government is liable for **compensation or termination payments** resulting from its default, payable within **60 days**, with **interest at Bank Rate + 3%** for delays.
Duration	Effective from the date of execution and valid until **termination or expiry** of all related Concession Agreements under the project.
Indemnity	Both the State and the Authority mutually **indemnify each other** against losses or liabilities arising from their respective breaches or defaults.
Dispute Resolution	Initial resolution through **conciliation** under the **Arbitration and Conciliation Act, 1996**; failing which, disputes shall be settled by **arbitration under ICADR Rules, New Delhi**.
Governing Law & Jurisdiction	Governed by the **laws of India**; jurisdiction lies with **Courts at Delhi**.
Miscellaneous	• Includes **waiver of sovereign immunity** by the State Government. • Agreement **binding on successors and assigns**. • All notices to be in **writing**. • The agreement is executed in **English**.

3.4 Review of Settlement Agreements

3.4.1 First Settlement Agreement (2018)

The **Settlement Agreement** was executed on **11th December 2018** at **NHAI HQ, New Delhi**, between:

- **National Highways Authority of India (NHAI)** (*Authority*), and
- **Navayuga Quazigund Expressway Pvt. Ltd. (NQEPL)** (*Concessionaire*).

The Agreement was signed under **Section 73 of the Arbitration and Conciliation Act, 1996**, following conciliation by the **Conciliation Committee of Independent Experts (CCIE-2)**. **It was executed to resolve project delays, financial constraints, and claims arising under the Concession Agreement dated 13.07.2010**, including disputes related to land acquisition, Force Majeure events, and One-Time Fund Infusion (OTFI) support.

Exhibit 18: Key Aspects of the 2018 Settlement Agreement

Parameter	Details
Date of Agreement	11th December 2018
Parties	NHAI (Authority) & Quazigund Expressway Pvt. Ltd. (Concessionaire)
Context	Settlement under Section 73 of the Arbitration and Conciliation Act, 1996, following CCIE-2 conciliation to address delays, cost overruns, and fund infusion for project completion
Background	• Concession Agreement signed 13.07.2010.• Appointed Date: 05.06.2011; scheduled completion: 04.06.2016. • Project delayed due to land acquisition, utility shifting, weather, law & order, and Force Majeure events.
NHAI Support	• Approved **One-Time Fund Infusion (OTFI)** of ₹575 Cr as advance loan .• Carried interest: **Bank Rate + 2% p.a.** • Recovery mechanism: from future annuities.
EOT & Compensation	• Extension of Time up to **31.12.2019**.• **880 days** delay recognized as not attributable to Concessionaire. • **424 days** (2.327 annuities) deducted for Concessionaire default. • Restored Annuities = ₹1,180.90 Cr (against 880 days).
Settlement Scope	• All pending claims and disputes till date of signing fully settled. • Concessionaire waived all cost overrun, IDC, escalation, and overhead claims.

Parameter	Details
Utilization Conditions	• ₹575 Cr to be used **only for physical completion**; not for IDC, debt servicing, or administrative costs. • To be disbursed in tranches based on verified progress.
Monitoring Mechanism	• Oversight by a **Monitoring Committee** comprising NHAI CGM (Tech), RO Jammu, and lender's representative. • Concurrent audit by NHAI-appointed auditor. • Sub-escrow account established for fund flow control.
Concessionaire Obligations	• Achieve **COD by 31.12.2019**. • Resume and complete stalled works .• Indemnify NHAI for any claims linked to land or delay.
NHAI Obligations	• Release ₹575 Cr advance loan. • Restore eligible missed annuities (880 days). • Grant time extension and finalize closure of all pending disputes.
Finality	Full and final settlement of all disputes up to 11.12.2018; no residual claims permissible.
Governing Law & Jurisdiction	Laws of India; Courts at Delhi.

3.4.2 Second Settlement Agreement (2022)

The **Settlement Agreement** was executed on **24th June 2022** at **NHAI HQ, New Delhi**, between:

- **National Highways Authority of India (NHAI)** (*Authority*), and
- **Quazigund Expressway Pvt. Ltd. (NQEPL)** (*Concessionaire*).

The Agreement was signed under **Section 73 of the Arbitration and Conciliation Act, 1996**, after review by **CCIE-2** and approval of the **Empowered Committee (MoRTH)**. It settled all remaining disputes till **Provisional COD (31.07.2021)**, including annuity restoration, change in law claims, and VAT reimbursement.

Exhibit 19: Key Aspects of the 2022 Settlement Agreement

Parameter	Details
Date of Agreement	24th June 2022
Parties	NHAI (Authority) & Quazigund Expressway Pvt. Ltd. (Concessionaire)
Context	Conciliation under Section 73 of the Arbitration & Conciliation Act, 1996 (CCIE-2), resolving all disputes till PCOD (31.07.2021)
Reference – 2018 SA	Original Settlement Agreement (11.12.2018) established OTFI & 880-day compensation; 2022 SA finalized reconciliation of missed annuities, O&M claims, and VAT liabilities.
Disputes Resolved	Claims under Clause 35.2 & 35.3 of CA, delays in 100% land availability, restoration of annuities, VAT impact, O&M cost reimbursement, interest reconciliation.
Settlement Amount	**₹863.24 Cr** (against total claim ₹2,223 Cr) comprising: • ₹719.81 Cr – 2.938 annuities restored (after 0.23 annuity deduction for 42-day delay). • ₹143.43 Cr – reimbursement for VAT, O&M, power supply, and excess TDS on interest.
Financial Impact	~61% reduction versus total claim value.
PCOD & Schedule	• **PCOD Date**: 31.07.2021. • Revised **Schedule M** finalized accordingly. • No change in total concession period.
NHAI Obligations	• Pay ₹863.24 Cr within 30 days of signing (by 30.06.2022). • Recognize PCOD and revised Schedule M. • Close all pending claims.

Parameter	Details
Concessionaire Obligations	• Maintain project highway per CA terms till concession end. • Waive all claims (cost overrun, IDC, escalation, O&M expenses). • Indemnify NHAI from third-party or statutory authority claims.
Legal Validation	Authenticated by **CCIE-2 (Justice I.P. Vasishth, Mr. A.K. Upadhyay, Mr. V.V. Ranganathan)** confirming voluntary and fair settlement.
Finality	Full and final closure of all disputes and claims till 31.07.2021; no residual claims or litigations permissible.
Governing Law & Jurisdiction	Laws of India; Courts at New Delhi.

3.5 Review of Major O&M Contracts

3.5.1 Review of Integrated Tunnel Management System (ITMS) Annual Maintenance Contract (AMC) Agreement

The Annual Maintenance Contract (AMC) for the Integrated Tunnel Management System (ITMS) at the Banihal Tunnel Project, Jammu & Kashmir, was executed between Athaang Infrastructure Pvt. Ltd. and Honeywell Automation India Ltd. in August 2023. The agreement covers comprehensive maintenance of key tunnel safety, control, and communication systems under a structured one-year service framework.

Exhibit 20: Key Terms of ITMS Annual Maintenance Contract (AMC) Agreement

Parameter	Details
Date of Work Order	07th August 2023
Parties	**Athaang Infrastructure Pvt. Ltd.** (Employer) & **Honeywell Automation India Ltd.**, Ground Floor, United Trade Centre, Sector 43, Gurgaon, Haryana (Contractor)
Contract Reference	Offer Ref.: HBS/North/2023/AIPL/New Contract/0039
Contract Value	**Basic AMC:** ₹1,25,10,000/- **GST @18%:** ₹22,51,800/- **Total: ₹1,47,61,800/- (Rupees One Crore Forty-Seven Lakh Sixty-One Thousand Eight Hundred Only)**
Project / Location	Banihal Tunnel Project, Jammu & Kashmir
Contract Period	1 Year (Service 180° Program) from date of award; extendable based on performance
AMC Type	Non-Comprehensive – includes manpower, maintenance, and software support; excludes hardware/spare replacement (chargeable basis)
Scope of Works	• Maintenance of **Integrated Tunnel Management System (ITMS)** comprising:– SCADA and PLC Systems– Fire Detection & Linear Heat Sensing (LHS)– CCTV Surveillance Network– Emergency Call & Telephone Systems– Traffic Management and Networking Systems

Parameter	Details
	• Software patching and bug fixes • Preventive and corrective maintenance • 4 preventive visits per year and SLA-based breakdown response
Support Model	• **On-site Team:** First-line troubleshooting (2 engineers on site) • **Technical Support Group (TSG), Pune HQ:** Advanced diagnosis and configuration • **Global Assistance Centers (Australia/USA/Germany):** Escalation and specialized support
Service Response & SLA	• **Minor Faults:** Within 24 hours • **Major Faults (CCTV/SCADA):** Within 24–48 hours • **Uptime Commitment:** ≥95% per quarter
Penalty for Downtime	• ≥95% uptime – Nil • 90–95% – 1% of quarterly AMC • 85–90% – 2%• 80–85% – 3% • <80% – 5% (maximum annual cap 5%)
Manpower Deployment	Two (2) full-time engineers at site (9×6 shift), supported by Honeywell's regional service network; PPE and equipment provided by Contractor
Payment Terms	• Quarterly advance payment against invoice within 30 days of receipt • No escalation permitted except statutory variations • Applicable deductions: TDS, GST, and other statutory levies
Mobilization Period	Within 15–20 days from the date of award
Cooling / Grace Period	120 days from contract commencement (no penalties during this stabilization phase)
Reports & Documentation	• Maintenance service report after each visit • Quarterly system health and uptime reports• Performance logbook maintained at site
Exclusions	Replacement of major hardware components, PCs, cabling, batteries, consumables, and civil/electrical works
Inspection & Quality	Subject to inspection by Employer, Independent Engineer, or Authority (NHAI); defects to be rectified at Contractor's cost

Parameter	Details
Liability & Indemnity	Contractor responsible for safety of personnel, equipment, and work quality; indemnifies Employer against any losses due to negligence or misconduct
Insurance	Contractor must insure workmen, materials, tools, and equipment; failure to maintain insurance may result in withholding of payments
Termination	Either party may terminate with **30 days' written notice**; Employer may terminate for non-performance, subcontracting without consent, breach, or safety violations
Suspension of Payments	Employer may suspend payments if Contractor fails to rectify defaults within 7 days of notice
Special Conditions	• Contractor bound by **Step-in Rights** of NHAI/Lenders • Replacement of unfit or negligent staff mandatory• Strict confidentiality of project data to be maintained
Jurisdiction	Laws of India; Arbitration under the **Arbitration and Conciliation Act, 1996**; Courts at Delhi

3.5.2 Review of Substation AMC Agreement

The Annual Maintenance Contract (Non-Comprehensive) for the Substation System at the Banihal Tunnel (NH-44) was executed between Quazigund Expressway Pvt. Ltd. (QEPL) and Sterling & Wilson Pvt. Ltd. The contract ensures the preventive and breakdown maintenance of the complete substation network supporting tunnel operations and ancillary systems.

Exhibit 21: Key Terms of Substation AMC Agreement

Parameter	Details
Date of Agreement / Work Order	04th October 2023
Employer	Quazigund Expressway Pvt. Ltd. (QEPL), Control Room, South Portal, Banihal, Ramban District, J&K
Contractor	Sterling & Wilson Pvt. Ltd.
Service Order Reference	QB/E&M/2023-24/158
Linked Proposal Reference	Honeywell Proposal Ref.: HBS/North/2023/AIPL/New Contract/0039 dated 07 August 2023
Contract Period	As per preventive maintenance cycle (2 quarters) – extendable based on performance and mutual consent
Contract Value	Net Total: ₹17,57,500/- GST @18%: ₹3,16,350/- Total: ₹20,73,850/- (Rupees Twenty Lakh Seventy-Three Thousand Eight Hundred Fifty Only)
Payment Terms	• Payment as per approved AMC schedule (2 quarters). • Payment released after successful completion of each service cycle. • All statutory deductions (TDS, GST, cess) as applicable.
Scope of Work	• Preventive maintenance of complete substation system. • Four preventive maintenance visits per year (as per Annexure I checklist) • Emergency breakdown visits on call. • Performance testing, tightening, cleaning, insulation, and functional checks.

Parameter	Details
	• Compliance with client's specifications and statutory regulations.
Execution Requirements	• Maintenance to be carried out under the supervision of QEPL officials and in line with NHAI guidelines. • All work to conform with relevant Indian Standards and safety norms. • Contractor to deploy qualified and experienced personnel only.
Service Provider Obligations	• Responsible for quality, reliability, and timeliness of services. • Must maintain qualified manpower and tools at all times. • Any deficiencies to be rectified at Contractor's cost.
Performance Documentation	• Preventive Maintenance Reports (PMRs) to be submitted after each visit. • Emergency Breakdown Reports (EBRs) to be filed post-rectification. • Post-implementation support as per agreement framework.
Standards & Compliance	• All works in accordance with client's technical standards, OEM manuals, and statutory safety laws.• Contractor responsible for compliance with all labour, EHS, and regulatory requirements.
Inspection & Verification	Subject to verification by QEPL, Independent Engineer, and/or NHAI. Non-compliance or defects to be rectified by Contractor at own cost.
Termination Clause	• QEPL may terminate the agreement at any stage without compensation if the Contractor fails to meet contractual obligations or timelines. • Contractor must refund any advance payments immediately upon termination. • QEPL may also terminate for breach, EHS violations, or non-performance.
Confidentiality (Clause 13)	All information shared by QEPL to be treated as strictly confidential. Any breach constitutes a material breach, giving QEPL termination rights.

Parameter	Details
Indemnity	Contractor shall indemnify QEPL against all losses, damages, claims, or IPR infringements arising from its acts, negligence, or performance failures.
Assignment / Subletting	Contractor shall not assign, transfer, or subcontract any part of the agreement without prior written consent of QEPL.
Delay & Damages	• Time is of essence. • Delay or non-compliance with specifications allows QEPL to terminate the contract • No explicit LD clause; remedy limited to termination and refund of advances.
Liability & Risk	Contractor responsible for safety of personnel, tools, and equipment; liability capped to contract value except for willful misconduct or statutory violations.
Insurance	Contractor to maintain insurance coverage for workmen, materials, tools, and equipment; non-compliance may lead to withheld payments.
Dispute Resolution / Arbitration	Disputes to be resolved through arbitration under the Arbitration and Conciliation Act, 1996; Sole Arbitrator to be appointed by QEPL COO; Venue: Mumbai; Language: English.
Governing Law & Jurisdiction	Governed by the laws of India; jurisdiction with Courts at Mumbai.

3.5.3 Review of Electrical Substation AMC Agreement

The Annual Maintenance Contract (Non-Comprehensive) for the Electrical Substation System at the Banihal Tunnel (NH-44) was executed between **Navayuga Quazigund Expressways Pvt. Ltd. (NQEL)** and **Sterling & Wilson Pvt. Ltd.** The contract covers routine preventive maintenance as well as emergency corrective support for the complete substation infrastructure supporting tunnel operations and associated electrical systems.

Exhibit 22: Key Terms of Electrical Substation System

Parameter	Details
Date of Agreement / Service Order	11th January 2023
Employer	Navayuga Quazigund Expressways Pvt. Ltd. (NQEL), South Portal, Banihal, Ramban District, J&K
Contractor	Sterling & Wilson Pvt. Ltd.
Service Order Reference	Service Order No. 35
Contract Period / Validity	01-Jan-2023 to 31-Dec-2023 (12 Months)
Contract Value	Base AMC: ₹35,15,000/- GST @18%: ₹6,32,700/- **Total: ₹41,47,700/-** (Rupees Forty-One Lakh Forty-Seven Thousand Seven Hundred Only)
Payment Terms	• 25% advance within 15 days of order issuance (adjustable in final invoice).• Balance through quarterly invoices, payable within 30 days of certification.
Scope of Work	• Non-Comprehensive AMC for complete electrical substation system. • Preventive maintenance: Quarterly, Half-yearly, and Annual detailed inspections including transformers, ACBs, VCB/SF6 panels, UPS, relays, and thermography. • Emergency breakdown support with corrective rectifications. • Thermography before and after rectification.
Execution Requirements	• Services to commence within 45 days of advance payment • Work to be executed under supervision of NQEL and as per statutory electrical safety norms and OEM standards.

Parameter	Details
Maintenance Schedule	• **Quarterly:** Visual inspection, logbook verification, fuse and protection checks. • **Half-Yearly:** Transformer IR/PI testing, breaker servicing, cable terminations. • **Annual:** Dielectric tests, relay calibration, CT testing, complete thermography of substation.
Corrective Maintenance	Emergency visit and repair/rectification in event of faults, failures, or operational disruption.
Documentation & Reporting	• Submission of Preventive Maintenance Reports (PMRs) after each planned visit. • Breakdown Maintenance Reports (BMRs) after each emergency intervention. • Annual Thermography Study Report.
Standards & Compliance	Services to comply with client specifications, statutory regulations, OEM manuals, and electrical safety protocols. Contractor responsible for manpower competency and regulatory compliance.
Performance Monitoring	All maintenance activities to be jointly certified by NQEL authorities. Any deficiencies to be rectified at contractor's cost.
Termination Clause	• NQEL may terminate the contract by giving 30 days' notice.• Compensation limited strictly to proportionate value of work completed. • Failure to meet service standards may lead to recovery of damages from invoices or retention.
Deficiency & Damages Clause	• Any service lapse, negligence, or operational impact shall be treated as "Deficiency in Service." • Client reserves right to assess and recover damages as liquidated claim (not considered penalty).
Confidentiality	All client-shared drawings, operational data, and technical details to be treated as confidential. Breach is considered material and may trigger termination.

Parameter	Details
Indemnity	Contractor indemnifies NQEL against any claims, IPR violations, service failures, or damages caused due to negligence or improper maintenance.
Assignment/ Subletting	Permitted only with prior written approval of NQEL. Contractor remains fully liable for subcontractor performance.
Force Majeure	Applicable in case of strikes, war, natural calamities, civil disruptions, or conditions beyond reasonable control.
Arbitration & Dispute Resolution	Sole Arbitrator appointed by Client COO; Arbitration under Arbitration and Conciliation Act 1996; Venue: Mumbai; Language: English
Governing Law & Jurisdiction	Indian Law applicable; Courts at Mumbai shall have jurisdiction

3.5.4 Review of Toll Management System AMC Agreement

The Annual Maintenance Contract (Non-Comprehensive) for the Toll Management System (TMS) on the Banihal Tunnel Section (NH-44) was executed between **Athaang Infrastructure Pvt. Ltd. / Quazigund Expressways Pvt. Ltd. (QEPL)** and **Techsture Technologies India Pvt. Ltd.** The agreement covers preventive and corrective maintenance of all toll system hardware, software, networking assets, and plaza-level IT infrastructure to ensure uninterrupted toll collection and system uptime.

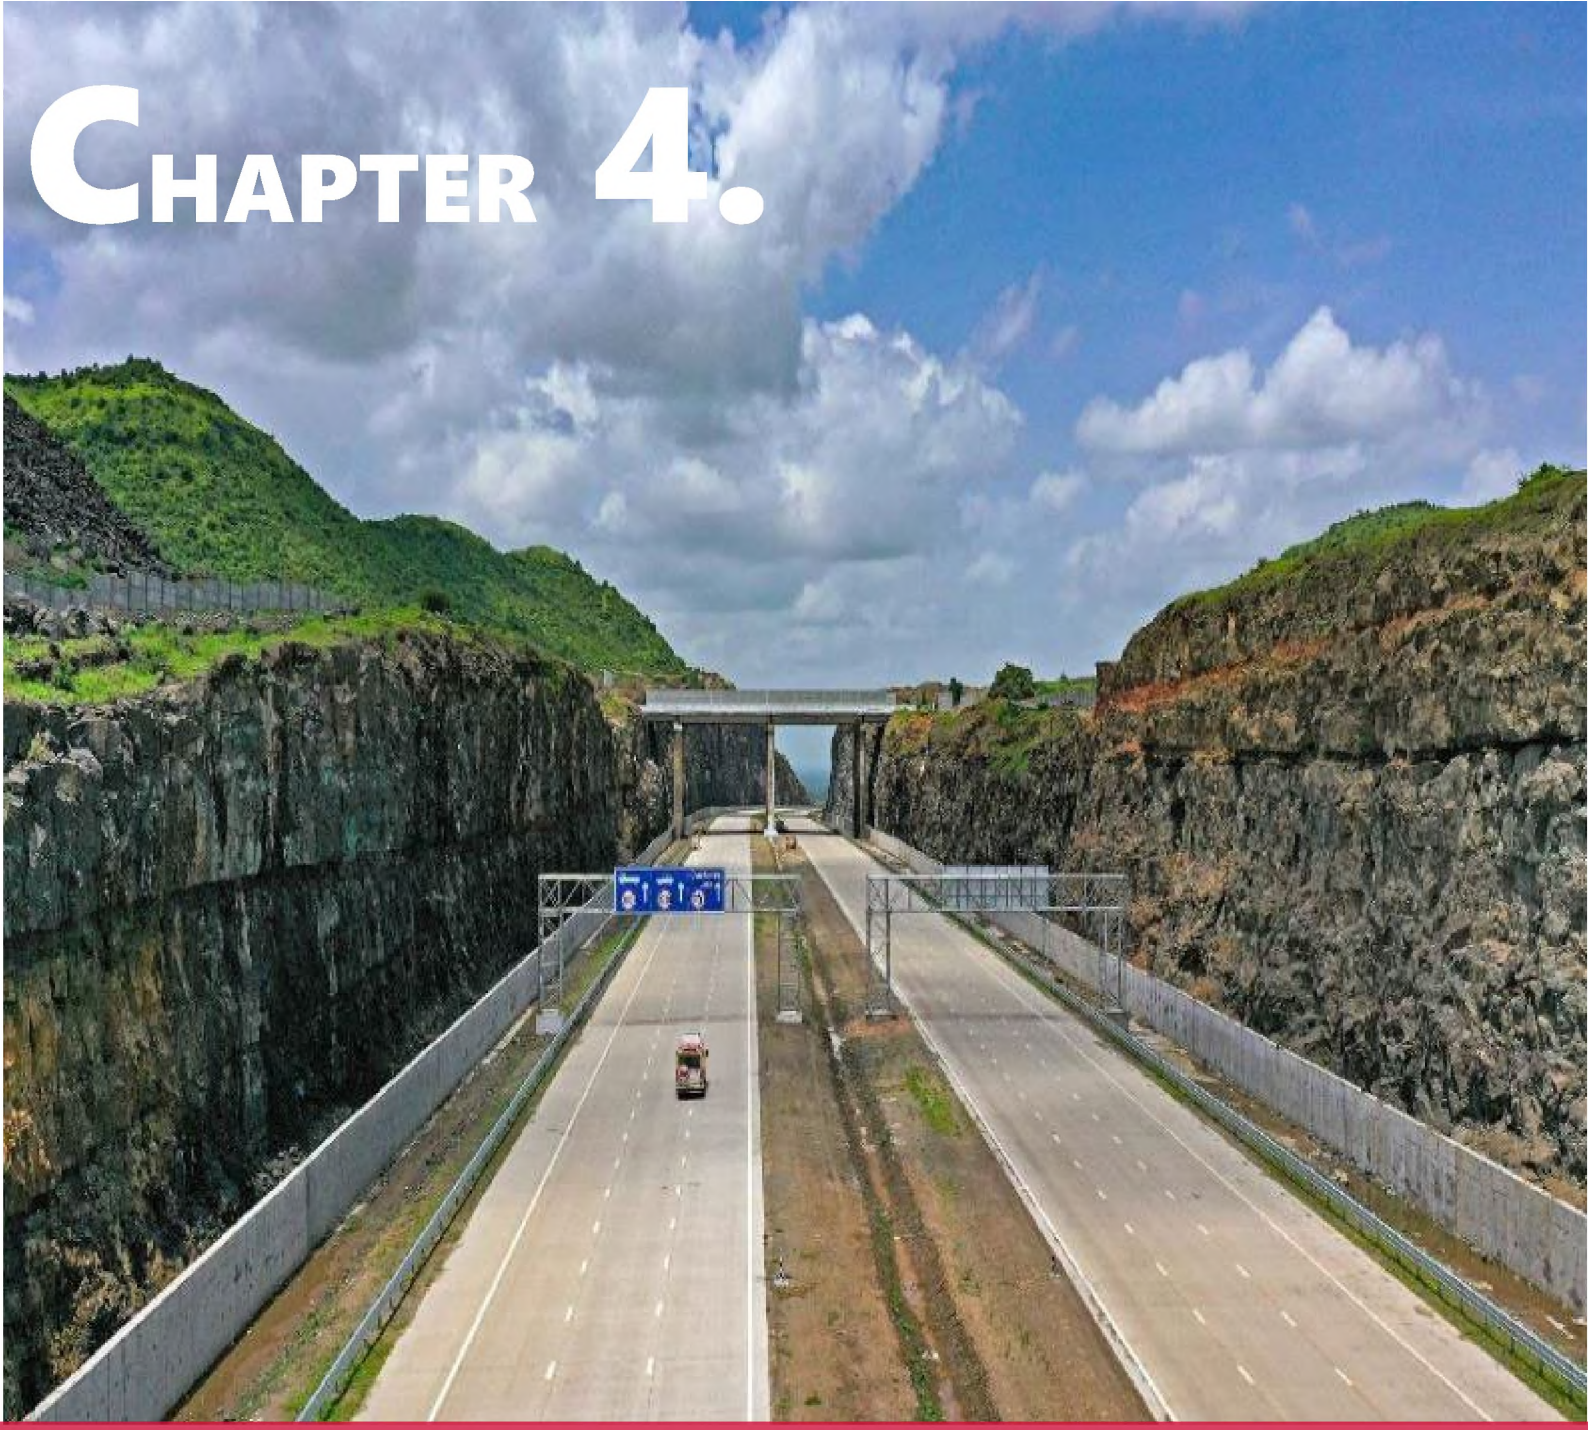
Exhibit 23: Key Terms of Toll Management System AMC Agreement

Parameter	Details
Date of Agreement / Purchase Order	30th June 2023
Employer / Purchaser	Athaang Infrastructure Pvt. Ltd. / Quazigund Expressways Pvt. Ltd. (QEPL)
Contractor / Service Provider	Techsture Technologies India Pvt. Ltd.
Purchase Order Reference	QB/IT/2023-24/86
Contract Period / Validity	01-Jul-2023 to 30-Jun-2024 (12 Months)
Automatic Renewal Clause	Automatically renewed annually unless terminated by either party with 30 days' prior written notice
Contract Value	**Base AMC: ₹14,98,600/-** **GST @18%: ₹2,28,600/-** **Total: ₹17,27,200/- (Rupees Seventeen Lakh Twenty-Seven Thousand Two Hundred Only)**
Payment Terms	• Monthly billing after successful completion of each month. • Payments subject to statutory deductions (TDS, GST, etc.).

Parameter	Details
Scope of Work	• Comprehensive AMC for TMS including hardware, software, ATMS support, lane systems, networking and control systems. • Daily/weekly preventive maintenance of critical components – barriers, printers, power supply, UPS, cabling, controllers. • Free software updates for compliance with IHMCL/NHAI standards. • Corrective maintenance including bug fixing, emergency rectification, and service restoration.
Manpower Deployment	• 1 Resident IT Engineer at each toll plaza (9 AM – 6 PM, emergency on-call support). • 1 Remote Software Engineer (offsite). • 1 Service Manager for escalation and reporting control.
System Uptime Requirement	Minimum **98% uptime** for toll system operations.
Penalty Clause	• If downtime >5% and attributable to contractor → **12% deduction on AMC value**. • Response to faults must be immediate (online support).
Maintenance & Reporting Protocol	• Daily and weekly system checklists to be logged. • Fault register maintained at plaza, signed by QEPL authority. • Weekly reports and MoM documentation for review meetings.
Training Obligations	Techsture to provide preventive and corrective maintenance training to QEPL technical team.
Spares Management	Contractor to provide list of recommended spares; QEPL to maintain onsite stock and manage issuance log.
Termination Clause	• QEPL reserves right to terminate anytime for non-performance or breach. • Supplier must refund any advance in case of early termination. • "Time is essence of contract" – delays qualify for termination action.

Parameter	Details
Confidentiality (Clause 13)	All toll data, system logs, configurations, and operational records are confidential. Breach is considered material → liable for termination.
Indemnity	Contractor indemnifies QEPL against all claims, damages, losses, or IPR-related disputes arising due to performance deficiencies.
Assignment / Subletting	Contractor shall not assign or subcontract any portion of the contract without written consent from QEPL.
Arbitration & Dispute Resolution	Arbitration under the Arbitration & Conciliation Act, 1996; Sole Arbitrator to be appointed by QEPL COO; Venue: Mumbai; Language: English.
Governing Law & Jurisdiction	Governed by the laws of India; Jurisdiction with Courts at Mumbai.

Chapter 4.



Review of Pavement Design

Chapter 4. CONDITION ASSESSMENT OF PROJECT ROAD

4.1 General

This chapter presents a detailed assessment of the existing condition of the Jammu–Udhampur Project Highway in accordance with the provisions of the Concession Agreement and relevant IRC guidelines. The objective of this assessment is to evaluate the current condition and performance of the pavement, structures, tunnels, toll plaza facilities, service roads, drainage systems, safety installations and other highway assets. The observations are based on site inspections, maintenance records, annuity performance, and interaction with the concessionaire's O&M team.

This section presents the findings of the **condition assessment** of the **Quazigund–Banihal Section of NH-44 (Km 189+350 to Km 204+700)** in the Union Territory of Jammu & Kashmir. The assessment has been prepared based on **field observations recorded during the site inspection conducted on 08 October 2025**, the results obtained from the **Falling Weight Deflectometer (FWD) survey carried out in June 2023**, and the **Mobile Bridge Inspection Unit (MBIU) survey conducted in December 2023**.

The integration of these three key datasets — *pavement deflection study (FWD)*, *structural evaluation of bridges (MBIU)*, and *visual field inspection* — provides a **comprehensive and reliable representation** of the current structural and functional condition of the project highway and its associated infrastructure.

The project corridor lies in a **mountainous and geotechnically sensitive zone** of the Himalayas, characterized by **steep gradients, sharp horizontal curves, high rainfall, and frequent exposure to adverse weather conditions**. The alignment commences near **Banihal village at Km 189+350** and terminates near **Quazigund at Km 204+700**, passing through two critical tunnel sections — a **single-tube short tunnel (Km 193+830 to Km 194+540)** and a **double-tube long tunnel (Km 194+700 to Km 204+000)**. The corridor serves as a **vital component of NH-44**, ensuring all-weather connectivity between Jammu and Srinagar.

The purpose of this condition assessment is to determine the **current structural health, performance efficiency, and serviceability** of the project highway and its assets. The study integrates data from both **instrumental evaluations** (FWD and MBIU) and **visual condition surveys**, enabling a holistic review of the **pavement system**, **structures**, **drainage**, and **associated highway facilities**.

Exhibit 24 Existing Vs Schedule B

Sl. No.	Particulars	As per Schedule–B	As Built & Deviations Settled in Supplementary Agreement
1	Project Road Start	Km 189+350 at Banihal	Km 189+350 at Banihal
2	Project Road End	Km 204+700 at Quazigund	Km 205+618 at Quazigund
3	Project Length	15.35 km	16.268 km
4	Tunnel	Short Tunnel – Km 193.792 to Km 194.488 (Length 696 m) Long Tunnel – Km 195.425 to Km 203.865 (Length 8.45 km)	Twin Tube Tunnel Tube 1 – 8457.70 m Tube 2 – 8463.38 m

The primary objectives of this assessment are to:

- Evaluate the **structural adequacy, layer stiffness, and residual life** of the pavement using **FWD test results (June 2023)**.
- Assess the **structural integrity and physical condition of bridges and culverts** based on the **MBIU inspection results (December 2023)**.
- Document the **on-ground physical condition of the pavement, structures, and roadside facilities** based on the **site inspection (08 October 2025)**.
- Identify **stretches requiring overlay, rehabilitation, or other maintenance interventions** to restore performance levels.
- Evaluate the **functionality of drainage, signage, tolling, and traffic management systems**.
- Verify **compliance with Operation and Maintenance (O&M) standards** as prescribed by **IRC codes** and the **Concession Agreement**.

This assessment has been carried out in accordance with the following key references:

- **IRC:115-2014** – *Guidelines for Structural Evaluation and Strengthening of Flexible Road Pavements using FWD Technique*
- **IRC:117-2014** – *Guidelines for Structural Evaluation of Rigid Pavements*
- **IRC:37-2018** – *Guidelines for the Design of Flexible Pavements*
- **IRC:SP:35-2015** – *Code of Practice for Inspection and Maintenance of Bridges*
- **IRC:83-2019 (Part I & II)** – *Guidelines for Design and Condition Assessment of Bridge Components*
- **IRC:SP:16 and IRC:SP:83** – *Guidelines for Maintenance of Highways and Toll Facilities*

4.2 Pavement

The proposed pavement design for the **Quazigund–Banihal Section (Km 189.350–Km 204.700)** follows **IRC:37-2012** and **IRC:58-2015** standards for flexible and rigid pavements respectively.

Exhibit 25 Main Carriageway (Flexible Pavement)

S. No.	Layer	Material Description	Thickness (mm)
1	Bituminous Concrete (BC)	Wearing course using VG-30 grade bitumen	40
2	Dense Bituminous Macadam (DBM)	Binder course with VG-30 bitumen	110
3	Wet Mix Macadam (WMM)	Granular base layer	250
4	Granular Sub-base (GSB)	Well-graded granular material	200
	Total Crust Thickness		**600 mm**

Exhibit 26 Service Road Pavement

S. No.	Layer	Material Description	Thickness (mm)
1	Bituminous Concrete (BC)	Surface course using VG-30 bitumen	40
2	Dense Bituminous Macadam (DBM)	Binder course	60
3	Wet Mix Macadam (WMM)	Granular base	250
4	Granular Sub-base (GSB)	Granular sub-base material	200
	Total Crust Thickness		**550 mm**

Exhibit 27 Rigid Pavement (Toll Plaza / Tunnel Section)

S. No.	Layer	Material Description	Thickness (mm)
1	Pavement Quality Concrete (PQC)	M-40 grade concrete	300
2	Dry Lean Concrete (DLC)	M-10 grade concrete	150
3	Granular Sub-base (GSB)	Granular layer	150
	Total Thickness		**600 mm**
	Reinforcement Details		

4.3 Assessment of Highway

Knight Frank carried out a detailed review and assessment of the **project highway assets**, which included **Service Roads (SR), Intersections, TLBs, BLBs, Sign Boards, MBCBs, and other related infrastructure components**. The assessment was undertaken through **comprehensive visual inspections** along the entire project stretch, supplemented by a **review of relevant reports and maintenance records** shared by the Client during site visit.

The objective of this exercise was to evaluate the **existing physical condition, functionality, and maintenance requirements** of each asset category. Based on the observations and data collected, a **maintenance strategy** has been formulated covering **regular repair, preventive, and routine maintenance activities** to ensure the long-term sustainability and serviceability of the highway assets.

Furthermore, the **pavement condition** was assessed through a combination of **visual inspection, and Falling Weight Deflectometer (FWD) testing**, providing a comprehensive understanding of surface condition, structural strength, and performance.

Overall, the review indicates that the **project highway assets are in satisfactory condition**, with all key components performing as intended. Minor deficiencies identified during the inspection can be addressed through routine and preventive maintenance measures as part of the recommended asset management plan.

a) Service Road/Slip:

Total length of service road is 400 m & the width of service road is 4.5 m. Haulage Road length is 3.546 Kms & the width of Haulage Road is 6 m. Service Road / Haulage Roads is constructed along the project as flexible pavements. The overall pavement condition is good. Pavement Markings are also found in service roads but are faded at some places

b) Lighting

Highway lighting has been provided at key locations such as junctions, flyovers, tunnels, and toll plazas to ensure adequate visibility and road safety during night hours. High mast lighting systems are installed specifically at junctions and toll plaza areas for enhanced illumination. Additionally, solar-powered blinker signals have been installed at selected median openings to alert and guide motorists at potential conflict points.

c) Metal Beam Crash Barrier

Metal beam crash barriers and wire-rope barriers are installed at critical locations (carriageway edges, underpasses, approaches and high-embankment zones) to protect against vehicular run-offs.

During inspection, minor looseness in some wire-rope assemblies and local damage to parapets/railings were observed. These are localized issues that can be rectified through routine tightening, replacement of worn components, and targeted repairs to restore full safety performance.

d) Drainage

The **drainage system** along the **Quazigund–Banihal Section of NH-44**, including the **Banihal Tunnels (T1 & T2)**, is a **comprehensive surface and subsurface drainage network** designed to efficiently manage both stormwater runoff and groundwater infiltration. The system comprises **longitudinal side drains**, **cross-drainage connections**, and **inspection manholes** categorized as **Surface (S), Drainage (D), Cable Recess (R), Low Voltage (L), and High Voltage (H)** types, placed at regular intervals along both tubes. These drains are interconnected through **RCC channels and perforated pipes** located behind the waterproofing layer to prevent hydrostatic pressure and ensure proper discharge towards portal-side sumps and outfalls.

Drainage Statistics:

- **Total drainage length (T1 & T2 combined): ~18.3 km (both tubes)**
- **Manholes and access chambers: 520 Nos (S, D, R, L, H types)**
- **Average spacing between manholes: 25–30 m**
- **Discharge outlets / sumps: 4 Nos (2 per tunnel)**

e) Bus Bays /Bus Shelters & Truck Lay Byes:

The project includes **two bus bays with passenger shelters** and **two truck lay-byes**, located near the **tunnel portals and toll plaza approaches**. These facilities are provided on both carriageways for safe stoppage, passenger convenience, and parking of heavy vehicles. All areas are equipped with **paved surfaces, drainage, lighting, and signage**, and were observed to be **functionally operational and well-maintained**, with only **minor repairs and cleaning** required at isolated locations.

f) Median & Median Opening:

The **median width** along the **Quazigund–Banihal Section of NH-44** varies between **1.5 m and 4.0 m**, constructed with **RCC kerbs and reinforced concrete shoulders** as per the **Concession Agreement (CA)** specifications. **Median openings** have been provided at designated locations to facilitate controlled cross-movement in accordance with traffic and safety requirements approved by local authorities. These openings are delineated with **pavement markings and reflective studs** to guide vehicular movement. A total of **46 median openings** are provided along the project stretch.

During inspection, it was noted that **blinker lights and cautionary signboards** were missing at a few openings, which should be reinstated under routine maintenance to ensure continued compliance with **IRC:67 and MoRTH safety standards**.

KF View:

Overall, the project highway is in satisfactory condition, with all major assets performing as intended. Minor deficiencies such as faded markings, missing blinkers, and loose barriers can be addressed through routine maintenance to ensure continued safe and efficient operation.

4.4 Assessment of Structures

A **visual condition survey** of all bridge and culvert structures was carried out jointly by the **Knight Frank (KF) team** and the **Concessionaire**, with the objective of **identifying and quantifying structural deterioration** arising from various factors such as **dead load, live load, wind load**, and **physical or chemical influences** exerted by the environment. In addition to examining **damages caused by unpredictable natural events** or **vehicular collisions**, the inspection also aimed to detect or monitor the impact of any **construction-related imperfections** that may affect long-term performance. Such periodic inspections play an important role in **enhancing the service life and safety** of both existing and newly built bridge structures.

Knight Frank reviewed the **structural condition assessment** of bridges and culverts along the **Banihal village at Km 189+350** and terminates near **Quazigund at Km 204+700**, passing through two critical tunnel sections — a **single-tube short tunnel (Km 193+830 to Km 194+540)** and a **double-tube long tunnel (Km 194+700 to Km 204+000)** during the **Operation & Maintenance phase**, based on **visual inspection** and findings from the **Mobile Bridge Inspection Unit (MBIU) survey** carried out in **December 2023** . The assessment encompassed all **major and minor bridges**, as well as **underpasses** along both the **left-hand and right-hand carriageways** of the corridor.

The observations were made through detailed **visual inspection, functionality checks, and performance verification** of all civil, structural, and electromechanical components, including **bridges, tunnels, culverts, toll plazas, ventilation buildings, drainage systems, and associated road furniture**.

Exhibit 28 Details of Structures

S. No.	Type of Structure	Chainage (Km)	Description / Configuration
1	**Major Bridge No. 1 (LHS)**	189+435	3×36.63 m span, RCC abutments & piers
2	**Major Bridge No. 4**	190+310	RCC deck slab type
3	**Railway Over Bridge (ROB)**	190+400 – 191+100	45 m wide steel girder with RCC slab
4	**Viaduct (South Portal Approach)**	192+600 – 194+200	Multi-span elevated viaduct

S. No.	Type of Structure	Chainage (Km)	Description / Configuration
5	**Truck Parking – South Portal (Lamber)**	192+700 – 193+500 (LHS)	Concrete pavement area with drainage channels
6	**Tunnel T1 (Short Tunnel)**	193+792 – 194+488	Length 0.69 km; 8.50 m wide carriageway with 1.05 m footpath
7	**Tunnel T2 (Main Tunnel)**	195+425 – 203+865	Length 8.45 km; 9.35 m wide carriageway with 1.16 m footpath
8	**Viaduct / Bridge (North Portal Exit)**	204+100 – 204+600	RCC spans with expansion joints
9	**Box Culverts (3 Nos)**	204+814, 205+131, 205+527	RCC Box type structures
10	**Truck Parking – North Portal (Ujroo)**	205+100 (RHS)	Concrete pavement area with facilities
11	**Toll Plaza Building – South (Lamber)**	193+760 (Approx.)	Admin + ETC + Control Rooms
12	**Toll Plaza Building – North (Ujroo)**	203+880 (Approx.)	Admin + ETC + Power rooms
13	**Ventilation Building – South Portal**	193+750	Jet fans, axial fans, and control panels
14	**Ventilation Building – North Portal**	203+880	Louvers, dampers, DG set & exhaust shafts
15	**Drainage Systems (General)**	Throughout alignment	Longitudinal drains, sumps, de-oiling tanks

The inspection revealed that the overall condition of the project assets is **functionally satisfactory**, with **major structures, tunnels, and ancillary facilities in operational condition**, while a few **localized deficiencies** such as damaged gratings, faded signages, non-functional tunnel lights, open hydrant cabinets, and minor surface cracks were observed at specific chainages. Routine **maintenance, cleaning, repainting, and rectification** activities were found to be ongoing under the scope of the concessionaire.

KF View:

Overall, based on the review of the previous MBIU survey reports (conducted by the SPV in December 2023) and a comprehensive visual examination during the site visit, it was observed that most structures are in sound structural condition and maintained in a fair state of serviceability.

4.5 Assessment of Road Furniture & Project Facilities

The inspection of highway and road furniture included **signages, guardrails, pavement markings, hazard markers, drainage gratings, SOS boxes, and lighting systems**. The overall condition was **fair**, but several elements were found needing repainting, replacement, or cleaning.

Road safety devices like **hazard markers, chevrons, and reflective signs** were either faded or damaged at several chainages, and some **road studs and rumble strips** were missing or worn. Tunnel SOS boxes were functional but had **non-working LED indicators** at certain points.

Exhibit 29 Details of Road Furniture's Items

S. No.	Facility / Item	Chainage (Km)	Observation / Condition
1	**Hazard Marker (Damaged)**	189+520 (RHS)	Bent / missing marker
2	**Overhead Gantry Sign Boards**	189+350 & 205+618	Faded / damaged boards
3	**Chevron Signs (Faded)**	192+300 – 192+400 (RHS)	Reflective film worn out
4	**Weighbridge Sign Board (Missing)**	193+935 (LHS)	Missing near Lamber Toll Plaza
5	**Informative Sign – Toll Ahead (Faded)**	193+300 (LHS)	Film faded
6	**Hazard Marker (Rectified)**	192+350 (LHS)	Earlier missing, now fixed
7	**Drainage Gratings – Truck Parking SP**	192+700 – 193+500	Damaged gratings
8	**Pavement Cracks / Settlement Zone**	193+050 – 193+080 (LHS)	Settlement at MCW
9	**Median Plantation – Section 1**	189+350 – 191+000	Plantation with tree guards

S. No.	Facility / Item	Chainage (Km)	Observation / Condition
10	**Road Studs / Cat Eyes (Missing)**	Inside tunnels and viaduct	Missing at several locations
11	**SOS Boxes (LED not working)**	Inside tunnels	Few SOS box lights not functional
12	**Fire Hydrant Cabinets (Open)**	Inside tunnels	Doors unlocked and unprotected
13	**Median Kerb Painting (Trial Patch)**	First 500 m inside Tunnel T1	Trial painting executed
14	**ROW Poles / Boundary Markers**	Throughout corridor	Not installed per NHAI standards
15	**Plantation – North Portal Section**	205+000 – 205+618	Ongoing plantation
16	**Lighting (Tunnel & Toll Plaza)**	Both tunnels and portals	Many non-functional lights
17	**Ventilation Jet Fans (Dusty)**	Inside tunnels	Working intermittently
18	**Bridge Name & ID Boards**	All bridge locations	Damaged / faded
19	**Medical Aid Post (Toll Plaza Complex)**	South & North Toll Plazas	Functional
20	**Rumble Strips**	Tunnel approaches & junctions	Faint markings

4.5.1 Project Facilities

Project facilities include **ventilation buildings, truck lay-bys, drainage systems, and tunnel support structures**. These were found in operational state with periodic maintenance activities.

Exhibit 30 Details of Project Facilities

Facility	Chainage (Km)	Condition / Observation
Ventilation Building – South Portal	193+750	Minor dust accumulation: fan cleaning required
Ventilation Building – North Portal	203+880	GI sheets replaced; louver maintenance pending

Facility	Chainage (Km)	Condition / Observation
Truck Parking – South Portal	192+700 – 193+500	Drainage damaged; repair under process
Truck Parking – North Portal	205+100	ROW cleaning required; gratings damaged
Drainage System	Entire corridor	Desilting in progress

KF View:

Based on the site visit, Knight Frank is of the view that the road furniture and project facilities are functionally adequate but require targeted remedial and maintenance action. Most defects are localized and maintenance-driven; however, a small number of safety-critical items (non-working SOS LED indicators, open fire-hydrant cabinets, missing road studs and non-functional lighting) should be rectified immediately to maintain safety and serviceability

4.6 Assessment of Tunnels

The **Quazigund–Banihal Section of NH-44 (Km 189+350 to Km 205+618)** traverses the **Pir Pranjal range of the Middle Himalaya**, a geologically complex zone characterized by folded sedimentary formations of the **Murree and Siwalik Groups**. The alignment primarily passes through the **Middle Siwalik formation**, comprising **medium- to fine-grained sandstone, siltstone, shale, and claystone**, with interbedded argillaceous and arenaceous strata. The overburden varies significantly across the alignment due to steep topographical gradients and sharp elevation differences between the north (Quazigund) and south (Banihal) portals.

The project features **two major tunnels – Tunnel T1 and Tunnel T2**, forming the critical connectivity link between Banihal and Quazigund, thereby bypassing the earlier snow-prone Jawahar Tunnel stretch. Both tunnels are twin-tube structures designed to carry **unidirectional traffic**, with dedicated **ventilation, lighting, fire safety, and drainage systems** as per **MoRTH and IRC:SP:91-2010 guidelines**.

An overview of the tunnel details for the project is provided below.

Exhibit 31: Details of Tunnel

Tunnel No.	Section	Portal Location	Design Chainage (Km)	Length (m)
T-1 (Short Tunnel)	South Portal (Banihal)	193.792 – 194.488	193+792 to 194+488	**690 m**
T-2 (Main Tunnel)	South to North (Banihal–Quazigund)	195.425 – 203.865	195+425 to 203+865	**8,440 m**

- **Total Tunnel Length:** 9.13 km (comprising two twin-tube tunnels)
- **Tunnel Configuration:** 2 × 2 carriageways (unidirectional, twin-tube)
- **Cross Passages:** At 300 m intervals for emergency evacuation
- **Fire Hydrant System:** Provided along both tubes at 90 m intervals
- **Drainage Sumps and Pumps:** Installed at each portal for dewatering

4.6.1 Tunnel Drainage

During our site visit, two separated drainage systems are Observed in tunnel for carriageway (surface) water and groundwater.

a) SURFACE WATER DRAINAGE SYSTEM:

The surface water is collected at surface water manholes located inside the driving lane side with inlets at intervals of approx. 50-60 m.

b) GROUNDWATER WATER DRAINAGE SYSTEM

The groundwater is collected by the sidewall drainage and the sub-base drainage. The groundwater within the side wall drainage is discharged into the main ground water drainage at the maintenance niches at intervals of approx. 50-60 m.

4.6.2 Manhole

During the inspection, manholes were observed to be strategically positioned at regular intervals to allow for routine inspection of electrical cables and drainage systems. Various types of manholes are present within the tunnel, including:

- Surface Water Manholes
- Cable Recess Manholes
- Low Voltage (LV) Cable Manholes
- High Voltage (HV) Cable Manholes

The details of manholes and their location are

- **Driving Lane: HV cable manholes, Recess manholes, Surface drainage manholes**
- **Emergency Lane: LV cable manholes**

Based on the site visit, Knight Frank (KF) is of the view that the regularly provided surface drain boxes—typically spaced at 25–50 m—provide effective access to the principal drainage conduit running the length of the tunnel. At the time of inspection, the drain boxes showed no visible clogging, which indicates consistent and effective maintenance practices to keep the drainage system operating unobstructed.

4.6.3 Power Supply & Substations in Tunnels:

Each tunnel portal is served by a dedicated **33/11 kV substation**, ensuring reliable power supply for tunnel systems, control rooms and ancillary buildings. The substations are located at the **Banihal (South) and Quazigund (North) portals** and receive primary power from the local utility (JKPDD). Redundant feed arrangements (Circuit A and Circuit B) and a looped HT cable between portal ventilation buildings and the five in-tunnel substations provide continuity of supply along the tunnel. UPS units provide conditioned emergency power for TMS and essential lighting; diesel generators provide backup in the event of utility failure.

- **Substation–1 (South / Banihal):** receives 11 kV from JKPDD and feeds tunnel lighting, ventilation, TMS and fire systems.
- **Substation–2 (North / Quazigund):** independent 11 kV supply feeding ventilation fans, control room and firefighting systems.

Key power assets and configuration observed / provided:

- DG sets: **one 500 kVA (North) and one 600 kVA (South)** (capable of being synchronized to provide improved redundancy for critical loads).
- DG synchronizing panel with **3 × 1600 A ACBs**.
- Ventilation power panels with **3 × 1600 A ACBs** and **6 × 400 A MCCBs**.
- Four (4) distribution sub-panels (each with a **400 A MCCB** and multiple **100 A MCCBs**).
- **16 VFD panels** for jet-fan control.
- MV/LV transformers located inside the ventilation buildings and at five in-tunnel electrical cross-passage substations (ECP-01 to ECP-05), spaced at approximately **1,500 m** intervals.
- 11 kV MV cables routed in conduit beneath the tunnel carriageway; HT cables looped between all substations to enable cross-feeding.

Redundancy is provided by the dual-circuit arrangement: **each tunnel substation can be fed from either portal** (Circuit A via Tube-1 or Circuit B via Tube-2), allowing one portal to supply the combined emergency/UPS load in the event of a failure at the other portal. DGs are sized and configured principally to sustain **UPS and essential systems (TMS & emergency lighting)**; full-load support for all tunnel loads from DGs alone is limited and therefore utility redundancy and cable loop arrangements remain the primary resilience strategy.

All major subsystems and field equipment are integrated to the **Control Room** via server–client/Modbus interfaces. The control room features a widescreen video wall tied to operator workstations and a master–slave server configuration with a database management system for

logging events, alarms and maintenance records; a designated operator monitors and controls day-to-day operations.

4.6.4 Tunnel Ventilation System and Safety Features

The **ventilation system** in both tunnels is of the **longitudinal type**, designed to maintain acceptable air quality and visibility levels within the tubes. Each tunnel tube is fitted with **axial jet fans**, strategically placed to regulate air movement and remove exhaust gases. The system is integrated with **CO (Carbon Monoxide)** and **NO_2 (Nitrogen Dioxide)** sensors for real-time air quality monitoring and is controlled through a **centralized SCADA system** housed at the south portal control building.

- **Tunnel T1:** Equipped with **8 jet fans**, 4 CO sensors, and 4 NO_2 sensors.
- **Tunnel T2:** Equipped with **20 jet fans**, 10 CO sensors, and 10 NO_2 sensors.
- **Cross Passages:** Provided every 300 m for emergency evacuation and fire segregation.
- **Fire Safety:** Fire hydrant network with landing valves every 90 m; emergency fire extinguishers at both portals; CCTV and Public Address System integrated with ATMS.
- **Drainage:** Longitudinal drain with collection sumps and submersible pumps at each portal to remove seepage and stormwater.

Exhibit 32: Summary of Tunnel Systems

Component	Description / Quantity	Status
Number of Tunnels	2 (Twin-Tube Configuration)	Operational
Total Length	9.13 km	Functional
Jet Fans	28 Nos. (T1 – 8, T2 – 20)	Operational
CO & NO_2 Sensors	28 Nos. (distributed along tunnels)	Functional
Cross Passages	300 m interval	Operational
DG Sets	2 Nos. (500 KVA each) per portal	Working
Substations	2 Nos. (Banihal & Quazigund)	Active
Fire Hydrant Points	At 90 m intervals	Functional
Drainage Sumps	2 (one at each portal)	Operational

4.7 Assessment of Tunnel FIREFIGHTING SYSTEM

The firefighting system includes both portable fire extinguishers and a pressurized hydrant network. The tunnel hydrant system is specifically designed to deliver pressurized water through hydrant valves positioned within the tunnel. Two-way hydrants are installed in designated niches at **250-meter intervals**, while **isolation valves** are provided every **1,000 meters** to enable sectional control. The system utilizes **150 NB main header pipes** to distribute water throughout the tunnel. Fire pump houses are located at both the **north and south portals**, each responsible for covering half the tunnel length. The **pumping capacity** of the system is **144 m^3/h**.

Each pump house is equipped with:

- **One electric motor-driven horizontal centrifugal pump**
- **One standby diesel engine-driven horizontal centrifugal pump**, activated during power failure or main pump breakdown
- **One jockey pump** to maintain system pressure during minor leakages

At each portal, **fire water storage tanks** with an effective capacity of **144 cubic meters** are installed. These tanks are divided into compartments and fitted with essential monitoring equipment such as **level indicators** and **temperature transmitters** to ensure reliable operation.

4.7.1 List of Key Major Fire Fighting Equipment observed at site during visit

I. **Hydrant Main Pumps** – 2 units

II. **Hydrant Standby Pumps** – 2 units

III. **Jockey Pumps** – 2 units

IV. **Circulation Pumps** – 2 units

V. **HSD Tank** – 1 unit

Knight Frank review the Maintenance and Inspection Schedule adopted by company for the maintenance of Firefighting system.

The following schedule is followed by site team for the maintenance of firefighting system.

- **Fire Hydrants** – Inspected biannually to check for damages, leaks, and operational readiness
- **Hydrant Functional Tests** – Conducted twice a year or as needed to ensure proper valve function and system response
- **Fire Extinguishers** – Inspected twice a year by an authorized third-party agency
- **Fire Alarm System** – Checked periodically in accordance with the Standard Operating Procedure (SOP)
- **Sprinkler Systems** – Inspected as per the SOP or maintenance manual to ensure leak-free and unobstructed operation
- **Emergency Lighting** – Tested monthly or quarterly to ensure functionality during power outages
- **General Maintenance** – Carried out in line with the project-specific maintenance manual for all components

KF View:

Based on the site visit, Knight Frank is of the view that the firefighting installation (hydrants, pump houses, storage tanks and portable equipment) is fit for purpose and maintained to acceptable standards. KF advises targeted actions such as regular diesel engine exercise under load, documented monthly pump performance logs, and an annual full-system functional test to mitigate operational risk.

4.8 Assessment of TUNNEL VENTILATION SYSTEM

The **ventilation system** in both tunnels is of the **longitudinal type**, designed to maintain acceptable air quality and visibility levels within the tubes. Each tunnel tube is fitted with **axial jet fans**, strategically placed to regulate air movement and remove exhaust gases. The system is integrated with **CO (Carbon Monoxide)** and **NO_2 (Nitrogen Dioxide)** sensors for real-time air quality monitoring and is controlled through a **centralized SCADA system** housed at the south portal control building.

Knight Frank team reviewed the tunnel ventilation system adopted for the project which is as follows

- The ventilation system designed with the heat release rate of 50MW consists of two tubes with unidirectional traffic flow.
- The first tube, known as the Northbound tube, leads traffic in the northern direction towards Srinagar,
- Second tube, called the Southbound tube, leads traffic in the southern direction towards Banihal
- There are two ventilation stations each at one portal end with total of eight fans (four at each end) located at the ends of these ducts. Half of both the tubes are catered by one fan station from North & South bound portals. The ventilation duct of each tube is separated by a remotely operated fire damper.
- The tunnels are also featured by booster jet fan (in group of two) which are strategically placed in the niches on side wall of the tunnel at 100 m spacing.

I. **Northbound Tube**

- Number of Jet Fans: 60
- Number of Fan Groups: 30
- Fan Diameter: 1000 mm
- Power Rating (each): 30 kW

II. Southbound Tube

- Number of Jet Fans: 66
- Number of Fan Groups: 33
- Fan Diameter: 1000 mm

- Power Rating (each): 30 kW

KF View:

Both the Ventilation Stations house a total of eight axial fans, All the axial fans are reversible

In emergency situations, the fans operate based on demand, with their speed and operation directly proportional to the fire's location within the tunnel.

4.8.1 List of Major Equipment for Tunnel Ventilation System:

S. No.	Item Description	Qty (nos.)	Equipment Design Life
1	Axial Fan135 m^3/s @ 3381 Pa (incl. transition piece) **Motor**: 1500 kW, 807 A, 1500 rpm	8	30 Years
2	VFD Panel- VFD Module: 400V, 880A & 500 kW- Main ACB: 690V & 1250A	8	15 Years
3	Jet Fan26.3 m^3/s, 1004 N (incl. 2 silencers & 1 fan bracket) **Motor**: 130 kW, 52.6 A, 1475 rpm	126	20 Years

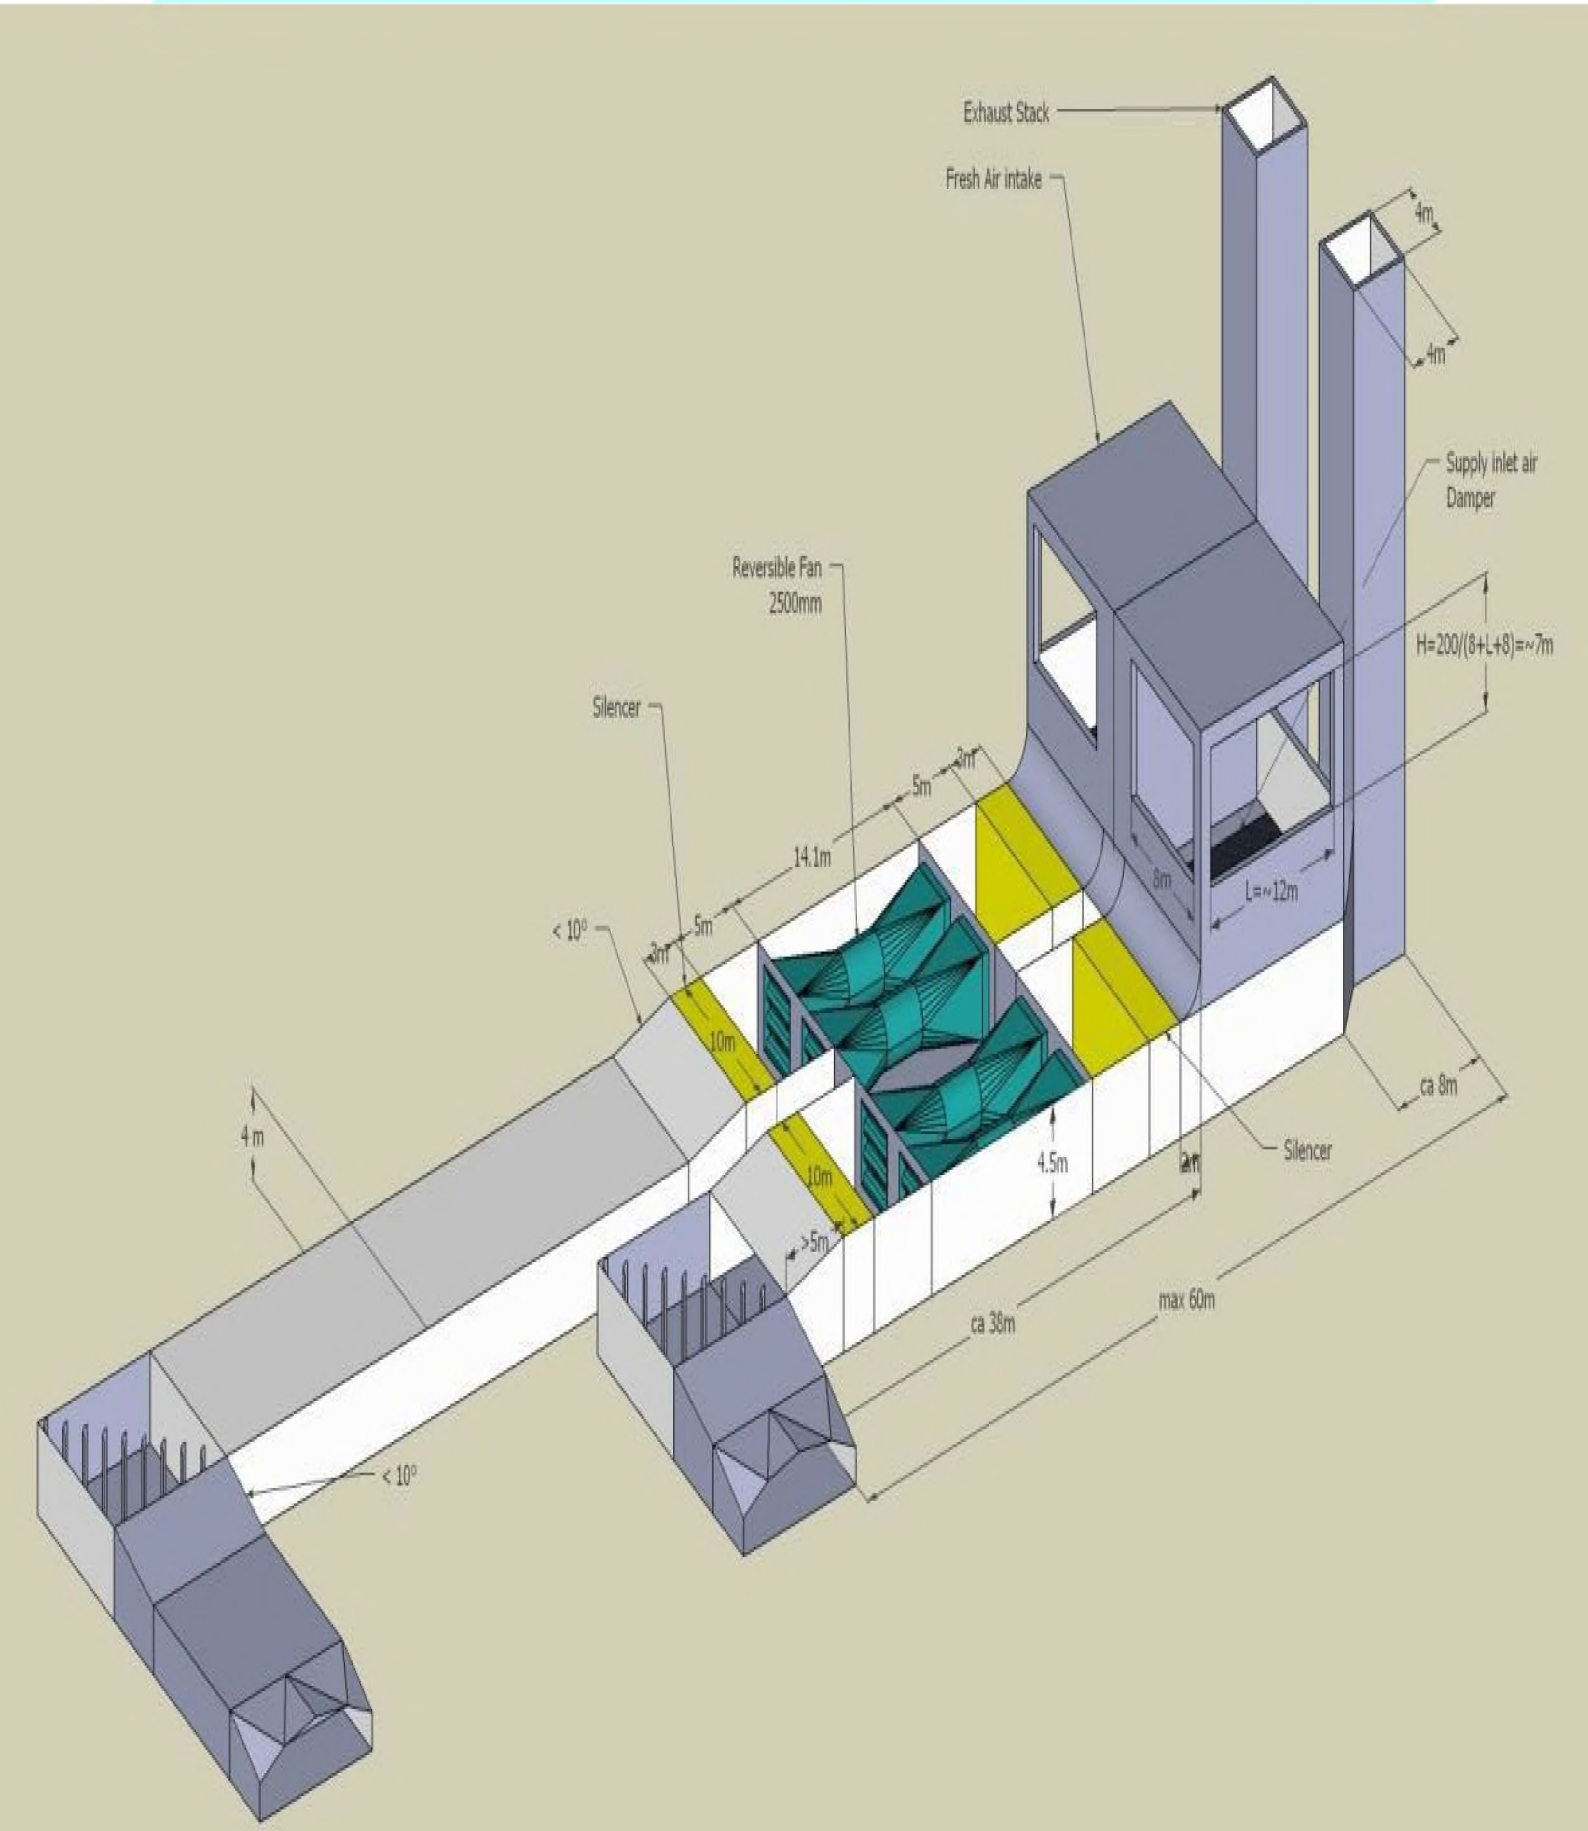
List of Maintenance Check & Frequency

Activity	Brief Description
Inspection	Check fans, dampers, systems for wear, noise, vibration.
Cleaning	Remove dust/debris to maintain airflow and efficiency.
Equipment Testing	Test fans/dampers; full tests post-fire incidents.
Monitoring Systems	Track air quality; adjust ventilation in real time.
Emergency Protocols	Define and train for emergency system use.
Fire Doors	Check closure, seals, and integrity.
Cross Pressure Test	Routine checks to detect air leakages.

KF View:

Based on the site visit, Knight Frank is of the view that the ventilation arrangement (two portal fan stations with 8 axial fans plus 126 jet fans and remotely-operated dampers) is fit for purpose and operates on demand as intended. To mitigate operational risk KF advises targeted actions: scheduled VFD and motor insulation

tests, vibration and bearing monitoring, regular jet-fan anchorage and silencer inspections, calibration of air-quality/smoke sensors, cross-pressure validation and annual full-load/realistic fire drills with control-system verification.



4.9 Assessment of INTEGRATED TUNNEL MANAGEMENT SYSTEM (ITMS)

Knight Frank team reviewed the Integrated Tunnel Management system adopted for the project which is as follows

- The ITMS network is composed of the optical fiber infrastructure installed inside the tunnels and the Ethernet switching equipment that provide the transmission backbone.
- The ITMS network transmission system will interface with the following systems to provide IP and ethernet services.
  - Emergency call station
  - CCTV Surveillance system & AID
  - Linear heat sensing
  - Traffic control system
  - Ventilation system
  - Tunnel lighting system
  - PLC & Power supply
  - Toll collections

KF View:

Knight Frank is in view that implementation of an Integrated Tunnel Management System (ITMS) leveraging fiber optic and Ethernet networks integrates multiple critical systems—CCTV, emergency call stations, ventilation, lighting, and traffic control—ensuring enhanced tunnel surveillance, control, and incident response capabilities.

4.10 Assessment of Toll Plaza

Two toll plaza complexes are located near **Lamber (South)** and **Ujroo (North)**, housing toll booths, administrative offices, control rooms, electrical panels, and washrooms. Both complexes are structurally stable and operational, though minor civil maintenance and electrical works were observed in progress.

Exhibit 33 Details of Toll Plaza

S.no	Toll Plaza Details		
1	Chainage (Km)	193+760	203+880
2	Toll plaza name	Lamber Toll Plaza	Urjoo Toll Plaza
3	No of lanes	6 lanes (3 each direction) – ETC & Manual mix	6 lanes (3 each direction) – ETC & Manual mix
4	Admin Building	Yes	Yes
5	Static Weigh Bridges (SWB)	2	2
6	Toilets	2	2
7	High mast lights	4 No's	4 No's
8	Toll Booths	12 No's	12 Nos.
9	Ambulance	2 Nos.	
10	Crane	2 No's	
11	Highway Patrolling Vehicles	2 No's	
12	Hybrid	10 No's	
13	Medical-Aid Post	Yes	Yes
14	Canteen	Yes	Yes
15	Control & Server Room	Yes	Yes
16	Firefighting System	Yes	Yes
17	Separator width at Toll booths (m)	1.8	1.8
18	Toll lanes width (m)	3.5	3.5
19	Extra Wide Lane width (m)	5.5	5.5

KF View:

Knight Frank reviewed the two toll plazas located at Km 193+760 (Lamber Toll Plaza) and Km 203+880 (Urjoo Toll Plaza) during the site visit, in line with the provisions of the Concession Agreement. Both plazas are equipped with 5 + 1 lanes

in each direction, operating under a Hybrid Electronic Toll Collection (ETC) system comprising both manual and electronic lanes.

Each toll plaza is provided with key facilities such as canopy and high mast lighting, administrative and control buildings, toilet blocks, static weighbridges, tow-away cranes, highway patrolling vehicles, paramedical booths, ambulance services, canteen, and firefighting systems.

Based on the inspection, Knight Frank is of the view that both Lamber and Urjoo Toll Plazas are in good operational condition, with all essential systems functional and routine maintenance being carried out satisfactorily.

4.11 Assessment of Toll Management System (TMS)

Knight Frank conducted a review of the **Toll Management System (TMS)**, including the **Electronic Toll Collection (ETC)**, **Weigh-in-Motion (WIM)** systems, and associated control mechanisms along the **Quazigund–Banihal Section of NH-44 (Km 189+350 to Km 205+618)** during the **site visit.**

The assessment was undertaken through field inspections, system demonstrations, and a review of documents and operational data provided by the Concessionaire. The TMS has been established to ensure **efficient, transparent, and automated toll collection**, integrating ETC, video surveillance, data logging, and centralized monitoring through control rooms at the **Lamber (Km 193+760)** and **Ujroo (Km 203+880)** toll plazas.

The system operates under a **Hybrid ETC framework**, equipped with **automatic vehicle classifiers, smart card readers, loop detectors, WIM sensors, automatic barriers, and CCTV cameras**. All systems are supported by **UPS and DG power backups** to maintain uninterrupted operation. Based on the inspection, the **TMS, ETC, and WIM systems were found to be in good working condition**, with only minor issues related to periodic calibration and sensor cleaning. Overall, the TMS is performing satisfactorily, ensuring smooth toll operations, reduced congestion, and improved transparency across the corridor.

4.11.1 Toll System Maintenance

The **Toll Management System (TMS)** for the **Quazigund–Banihal Section of NH-44** was installed by **M/s Techsture Technologies India Pvt. Ltd., Ahmedabad** and has been in continuous operation since its commissioning in **2017**. The **Concessionaire, M/s Quazigund Expressway Private Limited (QEPL),** has continued to engage the same system integrator under an **Annual Maintenance Contract (AMC)** for the operation and maintenance of all **TMS components**, including the **Hybrid Electronic Toll Collection (ETC) system** installed across all toll lanes at the **Lamber (Km 193+760)** and **Ujroo (Km 203+880)** Toll Plazas. The integrator remains responsible for the **upkeep, calibration, and servicing** of all tolling hardware and software systems to ensure uninterrupted functionality and compliance with NHAI standards.

4.11.2 Advanced Traffic Management System (TMS)

The ATMS installed in the tunnels includes **CCTV cameras, jet fans, ventilation controllers, and SOS panels**. Most systems are working, though several **CCTV cameras, jet fans, and LED indicators** require cleaning and calibration. The control rooms are functional, and operators were present during inspection.

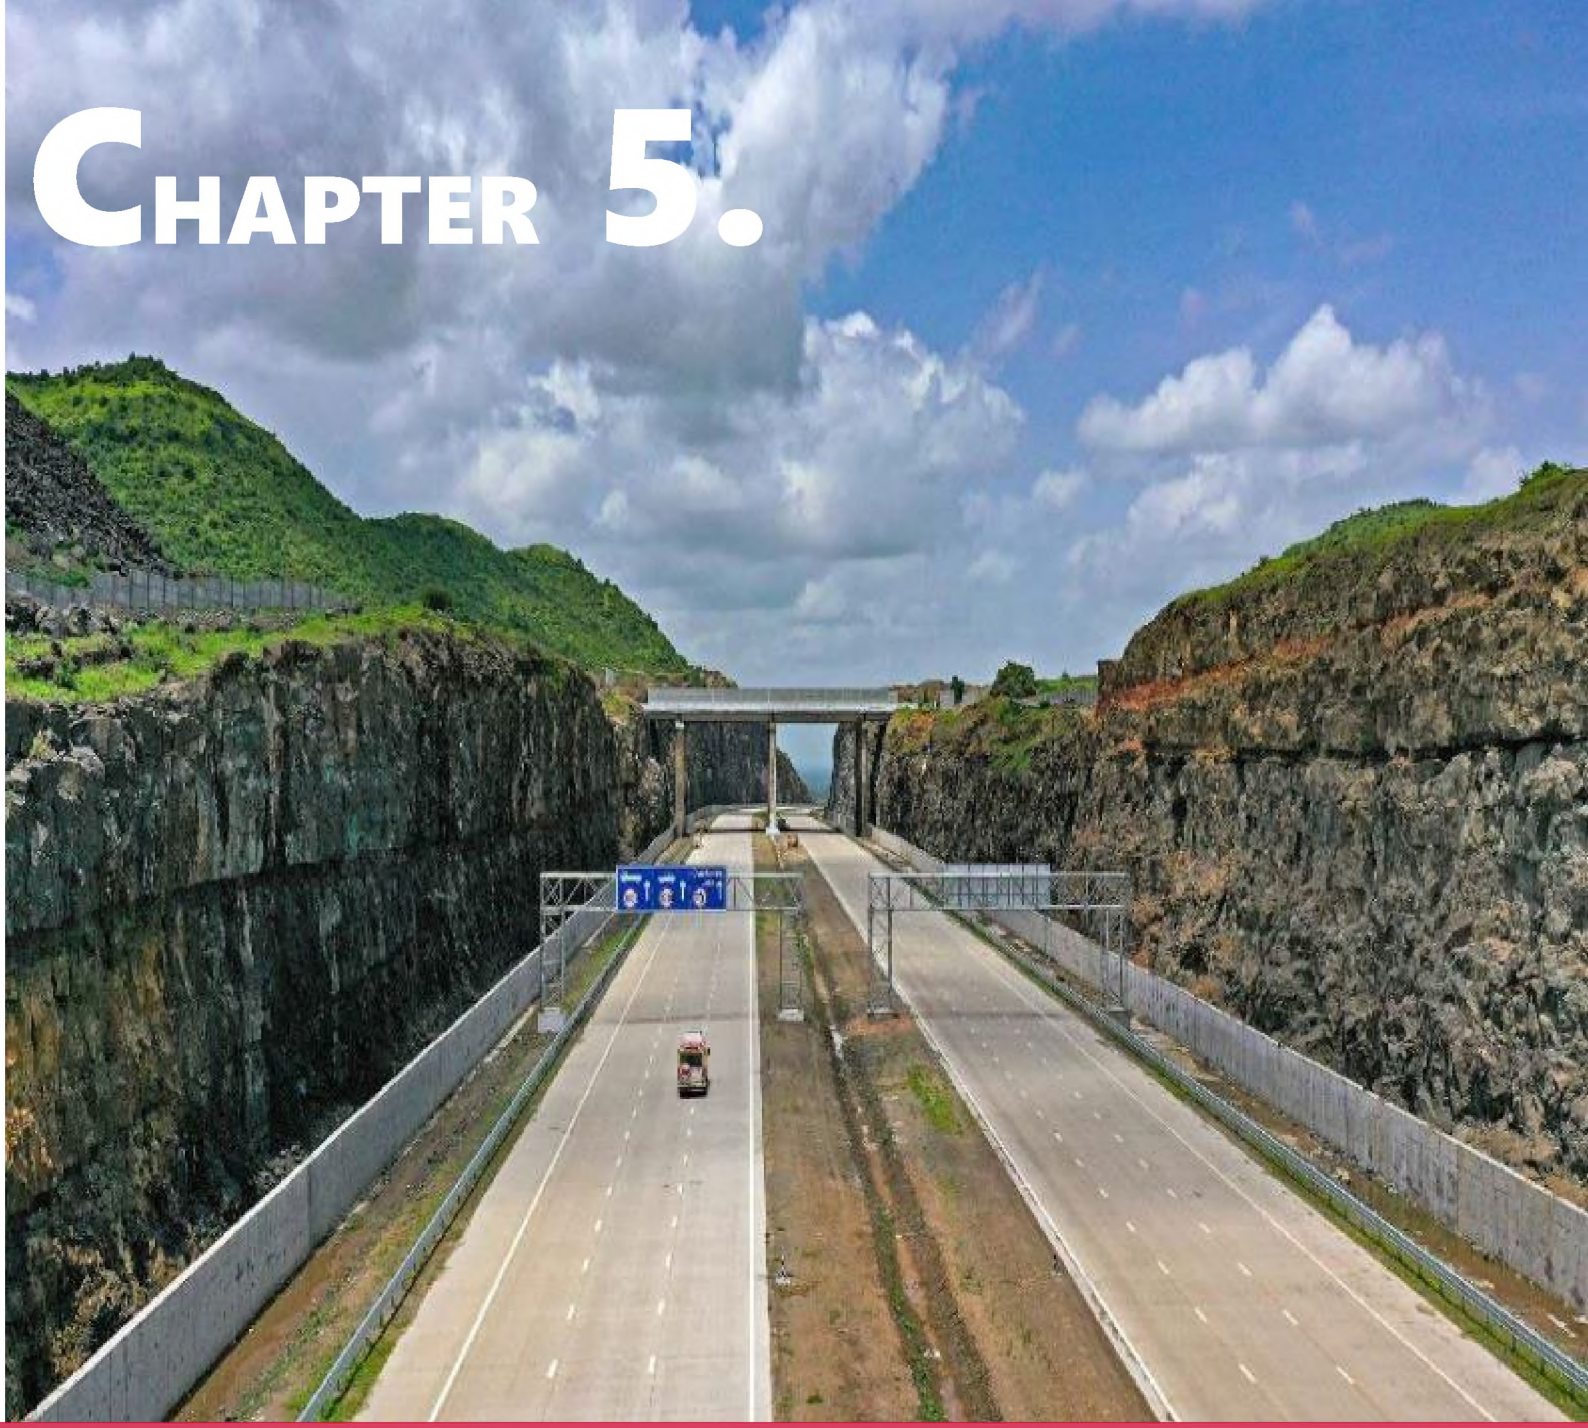
☛ Knight Frank reviewed the **Toll Management System (TMS)** installed along the **Quazigund–Banihal Section of NH-44 (Km 189+350 to Km 205+618)**, including **Electronic Toll Collection (ETC)** and **Weigh-in-Motion (WIM)** systems, through field inspections, system demonstrations, and review of operational records provided by the Concessionaire. The system operates under a **Hybrid ETC framework**, integrating **AVC, WIM, CCTV surveillance, and data logging** for centralized control at **Lamber (Km 193+760)** and **Ujroo (Km 203+880)** Toll Plazas.

The toll operations are being managed through a **third-party agency**, with the TMS presently **functional but operating with certain technical limitations**. The **Automatic Vehicle Classification (AVC)** system is profiler-based with local data storage; however, it does not transmit data independently when the lane controller is taken offline for maintenance. It was also observed that the **Lane Status Display Unit (LSDU)**—a critical component for real-time hardware monitoring and alert generation—has **not been installed**, leading to manual communication of equipment failures by toll operators or IT staff during inspections.

At present, the TMS functions primarily as a **ticketing-based system**, with toll transaction validation dependent on **manual inputs** from toll collectors. While overall tolling operations remain stable with no reported disruptions to revenue realization, **integration between AVC classification and Fastag validation** can be strengthened to improve transaction accuracy, transparency, and system reliability.

Based on the site inspection, Knight Frank is of the view that while the TMS and toll collection process are operational and performing satisfactorily, enhancements in real-time monitoring, system alerting, and data integration are recommended to ensure improved efficiency and long-term reliability.

Chapter 5.



Chapter 5. PAVEMENT INVESTIGATION & ASSESSMENT

5.1 General

The life of the Pavement has a co-relation with both its structural as well as Functional Condition. Inspecting and tracking of pavement condition, scheduling maintenance, and treating distress can have serious ramifications impinging on safety of road users and enhancing functional efficiency in end use of the Facility. It is therefore essential to carry out the assessment of the condition of the pavement on a given date taking into cognizance a variety of data to arrive at well-considered decisions and drawing up of the maintenance strategy and taking appropriate course of action to apply funds and resources in optimizing the desired levels of operations on the road assets. Condition data can include factors like roughness, specific distresses, rut depth, friction, and structural health.

Once measurements of road condition are available, they are interpreted in such a way that allows the decision-making process to occur in a logical fashion. This might involve converting multiple physical parameters into a single index, allowing different sections of a road network to be directly compared against one another etc.

Pavement performance under prevailing as well as projected traffic and environmental conditions is crucial as it has a direct bearing on the economic returns from the project developments. While an under-designed pavement will fail prematurely, imposing undesirable Cost Over runs on the Project. It is therefore necessary to ensure the pavement layer thicknesses; configurations and materials are adequately designed and require minimal maintenance under the anticipated traffic loading throughout the life cycle of the project.

To achieve this objective and thereby to predict the performance of any pavement structure, it is necessary to analyze material characteristics, traffic condition, present physical condition of the pavement layers, local environment, and its impacts. In addition, it is also necessary to presume what level of performance and what pavement conditions will be considered satisfactory to estimate the future operation and maintenance cost of the road.

Due to the variety of variables involved, it is essential to determine the exact level of pavement performance through the project life. But, based on the assessment of present condition of pavement, analysis of available survey data, traffic projections and estimations regarding the pavement life, future maintenance requirements can be estimated.

This part of the report deals with the Review of Pavement Design and provides insights on Design Life of the Pavement, Crust thickness, History of Overlays over the Existing Pavement Etc. for sound pavement performance through the project life.

The pavement design for the Quazigund–Banihal Section of NH-44 (Km 189.350 to Km 204.700) has been carried out in accordance with the guidelines laid down in **IRC:37-2012**, **IRC:81-1997**, and **MoRTH Specifications (5th Revision)**. The design accounts for the heavy commercial vehicle traffic, high axle loading, subgrade strength, and environmental conditions prevalent in the mountainous terrain of Jammu & Kashmir.

5.2 Objectives

The project road passes through a high-altitude hilly region of the Pir Panjal range, characterized by steep gradients, low temperatures, and substantial rainfall and snowfall. The alignment includes open road sections, tunnels, viaducts, and approaches requiring both **flexible and rigid pavement designs**.

The objective of the pavement design is to ensure durability, structural strength, and riding comfort for the design life of the pavement, while minimizing maintenance requirements under varying climatic and loading conditions. The design life adopted for flexible pavement is **15 years**, and for rigid pavement (tunnel and toll plaza sections) is **30 years**.

5.3 Review of Pavement Design

A. Design CBR

As per the Pavement design report, the subgrade CBR of **8%** was adopted for all flexible pavement designs. This value was derived from field investigations and laboratory tests and is consistent with IRC 37:2012 requirements. The CBR has been used to compute the resilient modulus of subgrade and thereby establish the required layer thicknesses.

B. Design MSA

Traffic projections were computed using commercial vehicle counts, axle load data, VDF, lane and directional distribution factors. The **Appendix-1 MSA Report** confirmed the following:

- COD 2017 – 2.80 million standard axles (base year traffic).
- 2026 (10 years) – 40 MSA,
- 2031 (15 years) – 70 MSA,
- 2036 (20 years) – 107 MSA

This formed the basis for flexible pavement thickness design and for extrapolating rigid pavement requirements.

C. Pavement Crust of Main Carriageway

The adopted pavement composition for the main carriageway, derived from IRC:37-2012 guidelines and IITPAVE analysis.

The crust thicknesses are as follows:

Exhibit 34 Adopted Composition – Main Carriageway:

Layer	Thickness	Remarks
Bituminous Concrete (BC)	40 mm	Surface Course, VG_30 grade bitumen
Dense Bituminous Macadam (DBM)	110 mm	Binder Course
Wet Mix Macadam (WMM)	250 mm	Base Layer
Granular Sub-Base (GSB)	200 mm	Sub-Base & Drainage Layer
Total Thickness	**600 mm**	**Adequate for 70 MSA (15 year)**

Paved shoulders are to be constructed with the same crust as the main carriageway, as per **IRC SP:84-2014 Clause 5.10**

D. For Service Road/Slip Road

The service road pavement design was carried out as per IRC SP:84-2014 requirements, with a design traffic of 10 MSA and subgrade CBR = 8%.

The crust thicknesses are as follows:

Exhibit 35 Adopted Composition – Service Roads:

Layer	Thickness	Remarks
Bituminous Concrete (BC)	40 mm	Surface Course
Dense Bituminous Macadam (DBM)	60 mm	Binder Course
Wet Mix Macadam (WMM)	250 mm	Base Layer
Granular Sub-Base (GSB)	200 mm	Sub-Base
Total Thickness	**550 mm**	**Adequate for 10 MSA (10 year)**

This configuration is economical, structurally adequate, and suitable for expected traffic demand on service roads.

E. Rigid Pavement – Tunnel and Toll Plaza

Rigid pavements are proposed for the tunnel and toll plaza areas, designed as per **IRC:58-2015** for a **30-year design life**. These sections are expected to carry cumulative loading equivalent to >100 MSA.

The crust thicknesses are as follows:

Exhibit 36 Adopted Composition - Tunnel and Toll Plaza:

Layer	Thickness	Remarks
Pavement Quality Concrete (PQC)	40 mm	Designed with dowel/tie bars, flexural strength governed by IRC:58
Dry Lean Concrete (DLC)	60 mm	Minimum cement content, strength as per IRC SP:49; extended 0.5 m beyond PQC
Granular Sub-Base (GSB – drainage)	250 mm	Designed with permeability ≥ 20 m/day
Total Thickness	**550 mm**	**Adequate for 30 years (>100 MSA cumulative traffic)**

F. Overlay Design

At the stage, **no overlay has been prescribed**, as the project involves the provision of **entirely new pavements**. The need for **future overlays** will be assessed based on **deflection surveys**, **roughness measurements**, and **distress mapping** conducted during the pavement's service life. Based on current projections, it is anticipated that overlays may be required after approximately **10 to 12 years** of service, subject to the **actual performance** of the pavement over time.

5.4 Test Pits & Subgrade Investigations

No information related to test pits or subgrade investigations is provided

5.5 Network Survey Vehicles (NSV) Survey

No information related to test pits or subgrade investigations is provided

5.6 FALLING WEIGHT DEFLECTOMETER (FWD) SURVEY

5.6.1 Pavement Evaluation by Falling Weight Deflectometer (FWD) Technique

a) Introduction:

The project stretch on NH-44 (old NH-1A), from **Km 189+350 to Km 204+700**, in Jammu & Kashmir, was evaluated using the Falling Weight Deflectometer (FWD) technique in June 2023. The study aimed to assess the **structural strength, residual life, and overlay requirements** for both flexible and rigid pavement sections in accordance with **IRC:115-2014** and **IRC:37-2018** guidelines.

b) Project Road

The evaluated corridor lies in Pulwama district, beginning near **Banihal (Km 189+350)** and terminating near **Km 204+700**. The stretch includes a **short single-tube tunnel (Km 193+830 to Km 194+540)** and a **long double-tube tunnel (Km 194+700 to Km 204+000)**. The alignment passes through hilly terrain with heavy traffic loading and experiences harsh climatic conditions including severe winters.

c) Pavement Condition

The pavement evaluation revealed distinct characteristics across flexible and rigid pavement sections. **Flexible pavement sections** comprised **bituminous layers over granular base and sub-base**, with **variable field conditions**. These sections exhibited typical **distresses such as rutting, cracking, and ravelling**. In contrast, **rigid pavement sections** featured **PQC slabs** at selected stretches, particularly near **tunnel approaches**, where **Load Transfer Efficiency (LTE)** and **flexural strength assessments** were conducted to evaluate structural performance. Overall, the **surface condition ranged from fair to good**, although certain stretches with **low residual life** were identified, necessitating **immediate overlay interventions** to maintain serviceability.

d) Falling Weight Deflectometer

In order to evaluate the structural strength of the existing flexible pavement, Falling Weight Deflectometer (FWD) survey has been carried out along the project road as per IRC: 115-2014 guidelines on the Main carriageway. The **equipment and procedure** for the pavement evaluation involved conducting a **Falling Weight Deflectometer (FWD) survey** using impulse loading equivalent to a **40 kN axle load**, simulating an **80 kN standard axle**. Deflections were recorded at

offsets of **0, 200, 300, 450, 600, 900, and 1200 mm**, with tests spaced at **250 to 500 meters** along both the **left-hand side (LHS)** and **right-hand side (RHS)** carriageways. To ensure accuracy, **temperature corrections** (standardized to **35°C**) and **seasonal variation adjustments** for **monsoon conditions** were applied.

For analysis, **KGPBACK** software was used to **back-calculate layer moduli**, while **IITPAVE** facilitated **fatigue and rutting life analysis** as well as **overlay design**.

5.6.1.1 FWD Analysis

i. Flexible Pavement Analysis

- **Back-calculated Moduli (15th Percentile):**
  - **Bituminous Layer:** 1644 – 2807 MPa (LHS), 1474 – 2234 MPa (RHS).
  - **Granular Layer:** 74 – 195 MPa (LHS), 72 – 253 MPa (RHS).
  - **Subgrade:** Stabilized at ~100 MPa (standardized).
- **Remaining Life & Overlay Requirement:**
  - **Design traffic considered:** 22 MSA.
  - **LHS:**
    - Section Km 191+200–193+500: Remaining life only **2.6–3 MSA**, requiring **80 mm overlay (30 mm BC + 50 mm DBM)**.
    - Section Km 204+370–204+700: Remaining life ~**4 MSA**, requiring **70 mm overlay (30 mm BC + 50 mm DBM)**.
    - Other stretches showed adequate life with no immediate overlay required.
  - **RHS:**
    - Section Km 193+800–191+700: Remaining life only **2 MSA**, requiring **80 mm overlay (30 mm BC + 50 mm DBM)**.
    - Section Km 191+700–189+350: Remaining life ~**12 MSA**, requiring **40 mm BC overlay**.
    - Other sections have sufficient rutting and fatigue life without overlay.

ii. Rigid Pavement Analysis

- **Methodology:**
  - Analysis followed **IRC:117-2014** using deflection basin parameters, load transfer efficiency (LTE), modulus of subgrade reaction, and flexural strength of concrete.
  - Fatigue behaviour checked through stress ratio (SR) models.

5.7 Structural Investigations

a. Introduction:

The MBIU survey was carried out in December 2023 to assess the structural and functional condition of bridges and viaducts along the Quazigund–Banihal section of NH-44. The objective was to record inventory details, identify maintenance requirements, and provide a comprehensive health check of the existing structures in service

b. Project Scope:

The inspected stretch covers NH-44 from Km 189+350 to Km 204+700. The inventory includes:

Total structures inspected: 14

Breakdown: 2 Major Bridges, 8 Minor Bridges, 2 RUBs (Road Under Bridges), and 2 Viaducts

Exhibit 37 List of Bridge Inspected

S. No	Chainage	Vent Size	Length of Bridge (m)	Type of Bridge
1	189+435 (Left)	3x36.63m	110.00	Major Bridge
2	189+435 (Right)	3x36.63m	110.00	Major Bridge
3	189+852 (Left)	1x22.654m	22.654	Minor Bridge
4	189+852 (Right)	1x22.654m	22.654	Minor Bridge
5	190+137	1x8.84m	8.84	Minor Bridge
6	190+318 (Left)	1x25m	25.00	Minor Bridge
7	190+318 (Right)	1x25m	25.00	Minor Bridge
8	191+097 (Left)	2x30m + 23.7m	83.70	RUB
9	191+097 (Right)	2x30m + 23.7m	83.70	RUB
10	191+427 (Left)	1x10.82m	10.82	Minor Bridge
11	191+427 (Right)	1x10.82m	10.82	Minor Bridge
12	193+395	1x9.2m	9.20	Minor Bridge
13	194+236 (Left)	38x36.60m	1390.80	Viaduct
14	194+236 (Right)	39x36.60m	1427.40	Viaduct

c. General Condition of Structure:

- Most structures are **serviceable** but exhibit early signs of distress.
- Common issues include:

- **Leakage through expansion joints** (observed at multiple bridges).
- **Clogged drainage spouts** across several structures.
- **Hairline cracks** on abutments, retaining walls, and underside decks (notably at Km 189+852).
- **Honeycombing and exposed reinforcement** near abutments and piers (e.g., A2 at Km 189+852).
- **Rusting in rivets and steel components** on viaduct piers (Km 194+236).
- **Debris accumulation** under and around bridges.

d. General Condition of Structure:

Exhibit 38 Inspection Reports of Bridges NH-44, Section: Banihal to Quazigund

S. No.	Location of Bridge (Ch)	Maintenance Requirements Observed During Inspection
1	189+435 (Left)	1. Leakage of Water through Expansion Joints. Needs to be repaired. 2. Clogging in Drainage Spouts, needs Cleaning.
2	189+435 (Right)	1. Leakage of Water through Expansion Joints Need to be repaired. 2. Clogging in Drainage Spouts, need Cleaning. 3. Slight settlement of 1st pier observed towards Quazigund, needs detailed inspection.
3	189+852 (Left)	1. Clogging in Drainage Spouts, need Cleaning. 2. Hair cracks were observed on the abutment surface & deck surface. 3. Honey combing & exposed reinforcement observed near A2 LHS, need to be repaired.
4	189+852 (Right)	1. Clogging in Drainage Spouts, need Cleaning. 2. Irregular surface of footpath, need proper plastering. 3. Hair cracks were observed on the surface of the deck underside & Abutment. 4. Steel bars were coming out of the retaining wall, need to be cut.
5	190+137	1. Bridge is in Good Condition.
6	190+318 (Left)	1. Clogging in Drainage Spouts, need Cleaning. 2. Debris observed in Expansion joints, need to be cleaned.
7	190+318 (Right)	1. Clogging in Drainage Spouts, need Cleaning.

S. No.	Location of Bridge (Ch)	Maintenance Requirements Observed During Inspection
8	191+097 (Left)	1. Bridge is in Good Condition. 2. Watermarks & leakage of water observed from the joints, need to be repaired. 3. The cover on the drainage in the footpath is damaged at a few locations, need to be replaced.
9	191+097 (Right)	1. Leakage of water from the joints was observed and rubber between the joints had also come out. Needs to be repaired. 2. The cover on the drainage in the footpath is damaged at few locations, need to be replaced.
10	191+427 (Left)	1. Clogging in Drainage Spouts, need Cleaning. 2. Debris under the bridge, require cleaning.
11	191+427 (Right)	1. Clogging in Drainage Spouts, need Cleaning. 2. Stone particles & Debris on footpath, need to be cleaned. 3. Steel reinforcement coming out of the parapet wall, need repairing.
12	193+395	1. Bridge is in Good Condition. 2. Stones & debris observed under the bridge, need cleaning. 3. Vegetation growth & accumulation of debris observed, require cleaning.
13	194+236 (Left)	1. Vertical cracks observed in the pier (4th & 5th). 2. Rusting started in rivets, need painting.
14	194+236 (Right)	1. Debris observed in the expansion joint, need to be cleaned. 2. Clogging in the Drainage spout, need to be cleaned. 3. Vertical cracks observed in pier no. 4th & 5th. 4. Steel beam in the expansion joints is damaged at the 17th expansion joint, needs repairing. 5. The Drainage spout at some location placed above deck level, need to be aligned properly. 6. Near 13th Expansion joints crash barrier is slightly damaged. 7. Horizontal surface cracks observed on 10th pier, require repair. 8. Rusting started in rivets, need painting.

e. <u>Repair and Maintenance Requirements:</u>

- **Expansion joints:** Repair of leakage and damaged sealing material.
- **Drainage spouts:** Cleaning, de-clogging, and realignment.
- **Cracks**: Repair of hairline and vertical cracks in abutments, piers, and decks with epoxy grouting/patching.
- **Concrete defects:** Honeycombing and exposed reinforcement require patch repair and protective coating.
- **Corrosion:** Application of anti-corrosive paint to rusted steel rivets and beams.
- **Structural safety:** Detailed inspection of the settled pier at Km 189+435 (RHS).
- **Debris removal:** Cleaning of accumulated debris beneath structures

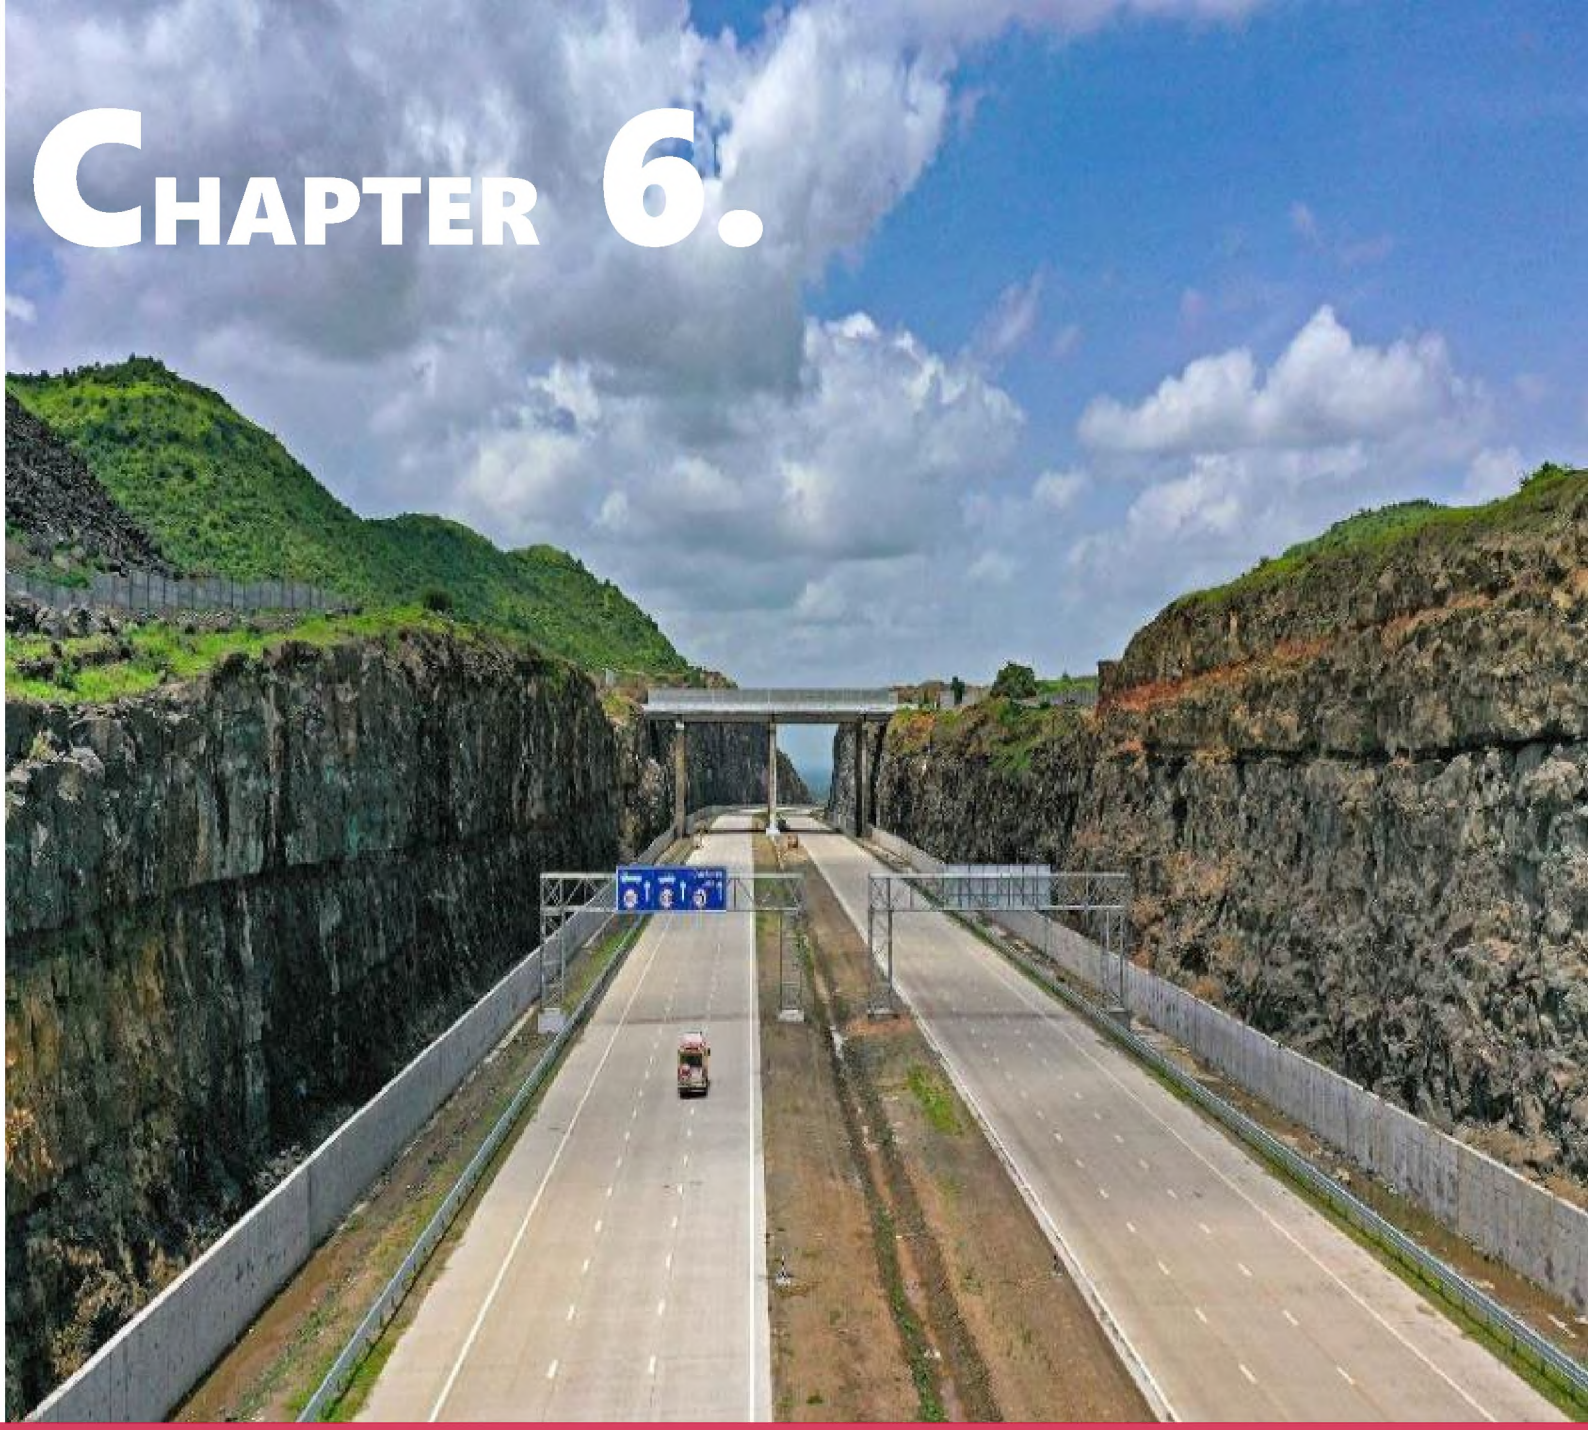
The MBIU survey indicates that the bridge and viaduct structures along the Quazigund–Banihal stretch are **generally in a functional condition** but show **localised defects** requiring attention. Timely intervention, particularly on drainage systems, expansion joints, and structural cracks, is essential to prevent further deterioration.

The **viaducts at Km 194+236** and **major bridge at Km 189+435** are critical locations requiring priority repair due to structural cracks, rusting, and settlement. Regular monitoring and preventive maintenance are recommended across the corridor.

5.8 Major Maintenance of Pavement

The periodic maintenance strategy has been developed considering the service life of flexible and rigid pavements, climatic conditions of the project corridor, and expected traffic loading. The project corridor (Km 189.350 – Km 204.700) includes both **flexible pavements** on the main carriageway and service roads, and **rigid pavements** at the toll plaza, tunnel sections, and lay-bys. Maintenance interventions are planned in two distinct **Maintenance Management (MM) Cycles**, ensuring the pavement network continues to perform within the serviceability criteria prescribed

Based on above test results, Concessionaire prepared Strategy, Major Maintenance details discussed at **Chapter 6**



Chapter 6.

Cost Estimate

Chapter 6. COST ESTIMATES

6.1 General

Based on the assessment carried out in previous chapters, various costs were worked out. The costs are divided into following categories –

I. Routine O&M Cost
II. Major Maintenance Cost
III. Periodic Replacement of TMS/ATMS system

Costs for different category are detailed out in subsequent sections along with the assumptions considered for rate and Escalation.

6.2 Rate Assumption

The cost estimates are based on the following assumptions:

Following assumptions are considered for unit rates of various items while estimating the cost –

1. Unit rates of different items (BC, DBM, Concrete, Road markings etc.) are calculated as per the MoRTH Standard data book. The input rates for MoRTH standard data book were adopted as below
   a) **Manpower and labor** – As per applicable minimum wages published by Ministry of Labour & Employment, Government of India
   b) **Bitumen** – Bitumen rates are considered to be sourced from IOCL Panipat Refinery. The distance (to- from) from the midpoint of Project Highway is considered as 550 kms. VG-30 and VG-40 grades of bitumen are considered in our cost estimate.

☛ ***Concessionaire has long term contract with IOCL for the procurement of bitumen and related products. Same discounts are considered on bitumen procurement for this analysis. Furthermore, we also understand that bitumen prices are primarily dependent on crude oil price and market demand and hence are likely to be very volatile and difficult to predict at this stage.***

Therefore, Bitumen prices are considered as per the client's forecast. Current published of bitumen are considered for unit rates calculation for FY24 and FY25. Average 10 years of price of bitumen are considered for unit rates calculation for FY26 and onwards, since bitumen prices have been range bound over the last five-six years. Following rates of bitumen are considered

Exhibit 39 Bitumen Rates (in INR/MT) - Ex-MI supply excluding discount and GST

Refineries	Grade	Rate for FY24 and FY25	Rate for FY26 onwards
IOC Mathura	VG10	45522	33955
IOC Mathura	VG30	46322	34552
IOC Mathura	VG40	48652	36290
IOC Haldia	VG10	45922	33258
IOC Haldia	VG30	46722	33838
IOC Haldia	VG40	49052	35525
IOC Barauni	VG10	46952	34004
IOC Barauni	VG30	47752	34584
IOC Barauni	VG40	50082	36271
CPC Chennai	VG10	44922	33541
CPC Chennai	VG30	45722	34138
CPC Chennai	VG40	48052	35878
IOCL Panipat	**VG10**	**45,830**	**33,915**
IOCL Panipat	**VG30**	**46,630**	**34,506**
IOCL Panipat	**VG40**	**48,960**	**36,230**

c) **Sand and Aggregate** are sourced from the nearest quarry located on project highway.

d) **Cement** is procured from the nearest local market.

e) **Machinery Hire charges** of Plant and Machinery for various items of works have been considered from J&K SOR 2022 and some rates are considered from MORT&H Standard Data Book 2001-2002. Escalation has been considered on MORT&H Plant and Machinery rates to arrive at the present rates of 2024-25.

f) **Material Rates** are obtained from SOR of J&K, PWD 2021-22.

g) Some of the rates are based on Consultant's experience on similar ongoing projects in adjacent locations.

h) **Overheads and profits** have been considered based on MORT&H Standard Data Book. Applicable taxes have been considered in the Rate Analysis.

Goods and Service Tax (GST) is considered as 18% as per the latest Government Guidelines

Exhibit 40 Adopted Unit Rates for Key items

S.nos	Items Description	Unit	Rates (₹)
1	Dense Bituminous Macadam	Cum	9,731
2	Bituminous Concrete	Cum	11,274
3	Slab replacement cost (PQC)-MCW	Cum	7,949
4	Joint Sealant Replacement/Repairs	Rm	191
5	PQC Taxing	Sqm	185
6	Micro surfacing	Sqm	220
7	Milling	Sqm	107
8	Raising of Road Kerb	m	409
9	Road Marking	sqm	518
10	Kerb and Crash Barrier Painting	sqm	116
11	Tack Coat	Sqm	14
12	Manhole	Nos.	26,695

- *The above unit rates are excluding GST.
- The unit rate of each item includes 10 % overhead for road works, 15 % overhead for structure works and 10 % contractor's profit.
- Details of components considered in rate analysis & quantification are presented in below **Exhibit 41**

Exhibit 41 Major Components Detail for Key items

Sr. No.	Particular	Source	Reference
1	Rate Analysis	MORTH	Standard Data Books published by MORTH
2	**Material**		
A	Aggregate Rates	Nearby Project Corridor	As per Local Market Rates
B	ATMS, TMS cost		As per Vendor offer.
C	Cement	As provided in Local market	As per Local Market Rates
3	Equipment hire cost	Nearby project location	Standard Data Books published by MORTH
4	Labour	As per minimum wages	As per minimum wages

6.3 Routine Operation & Maintenance (O& M) Cost

Operations and Routine Maintenance work required as per the CA. During the concession period, the Concessionaire is fully responsible for Operation & Maintenance of Project Highway. Schedule K elaborates the requirements of various service factor desirable level and acceptable level during O & M period along with time if any parameter level of service beyond acceptable limit.

The CA Stipulates that the Concessionaire shall Operate and Maintain the Project Highway in accordance with Article 17 – Operation & Maintenance & Schedule –K Maintenance Requirements of Concession Agreement. The obligation of Concessionaire as per Article 17 is as follows:

- permitting safe, smooth, and uninterrupted flow of traffic on the Project Highway during normal operating conditions; collecting and appropriating the Fee.
- minimizing disruption to traffic in the event of accidents or other incidents affecting the safety and use of the Project Highway by providing a rapid and effective response and maintaining liaison with the emergency services of the State.
- carrying out periodic preventive maintenance of the Project Highway.
- undertaking routine maintenance including prompt repairs too, cracks, joints, drains, embankments, structures, pavement markings, lighting, road signs and other traffic control devices.
- undertaking major maintenance such as replacement of panels in rigid pavement and associated activities
- preventing, with the assistance of concerned law enforcement agencies, any unauthorized use of the Project Highway
- preventing, with the assistance of the concerned law enforcement agencies, any encroachments on the Project Highway
- protection of the environment and provision of equipment and materials therefore
- operation and maintenance of all communication, control and administrative systems necessary for the efficient operation of the Project Highway
- maintaining a public relations unit to interface with and attend to suggestions from the Users, government agencies, media, and other agencies; and
- Complying with Safety Requirements in accordance with Article 18.

Routine O&M cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses, horticulture and ROW maintenance, routine maintenance and other miscellaneous expenses. The Concessionaire has provided the major agreements towards operation and maintenance for past years. Necessary assumptions have been made from the expenses of similar type of projects to arrive at the operating cost. The estimates are projected based on best industry practices and are compared with the operation cost in the vicinity of the project area. Same has been divided into following major head

1. Salary and Welfare Expenses
2. Tolling Operations Services
3. Incident Management Services
4. Electricity and Diesel Charges
5. TMS/HTMS/System Expenses
6. Office Operating Expenses
7. Vehicle Running Expenses
8. Professional Fees Expense
9. Insurance Expense
10. IE Fees
11. Horticulture & ROW Maintenance
12. Routine Maintenance Cost

In above, the Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey. Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or "wear-and-tear". Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards

6.4 O & M Strategy

Important Operations and maintenance work have been outsourced by the SPV. Details of important works are listed below

Exhibit 42 O & M Strategy

Sn	Activity	Strategy
1	Manpower	In-house
2	Civil work cost	In-house
3	Manpower for Electrical & Mechanical	Outsource
4	Agency for Toll Plaza (TMS)	Outsource
5	AMC for Electrical system	Outsource
6	ITMS AMC	Outsource
7	Rectification work for Electromechanical	Outsource

6.5 Manpower cost

Manpower costs have been estimated based on a combination of market benchmarks and historical contractual data, with appropriate price escalation factored in to reflect anticipated future cost increases. The manpower requirements are categorized into four primary segments:

1. **Project Office and Administration**: Covers expenses related to staff involved in overall project management, administrative duties, and associated benefits and overheads.
2. **Route Operations**: Includes salaries and benefits for frontline operational personnel such as toll operators, traffic controllers, and other essential staff ensuring uninterrupted tunnel functionality.
3. **Ancillary Services**: Encompasses costs for support roles like security staff, emergency response units, and other service teams vital to maintaining safety and operational readiness.
4. **Highway and Tunnel Maintenance and Repair**: Pertains to compensation for technical and maintenance staff responsible for routine upkeep, repairs, and general infrastructure support within the tunnel.

Total Manpower cost estimated by Knight Frank is ₹ 83.20 Crore for the balance concession period.

Exhibit 43 Manpower Cost

Manpower Cost			
Year in Nos	**Years**	**Manpower**	**Remarks**
			Each year 10% escalation is considered
1	FY26	10.8	
2	FY27	11.9	
3	FY28	13.0	
4	FY29	14.4	
5	FY30	15.8	
6	FY31	17.4	
Total Cost (₹- Crore)		**83.30**	

Detailed Manpower Costs covers following items cost

- **Project Office and Administration**: Costs are derived from prevailing market rates and past contractual terms, incorporating annual cost escalations.
- **Route Operations**: Calculated based on staffing requirements, specific roles, and associated employee benefits, ensuring adequate coverage for smooth tunnel operations.
- **Ancillary Services**: Includes estimated expenses for security and emergency response personnel, along with costs for necessary equipment and training.
- **Highway and Tunnel Maintenance and Repair Works**: Provides a thorough breakdown of costs for maintenance crews, factoring in labor, tools, and essential equipment required for upkeep and repairs.

6.6 Vehicle Maintenance Cost

Total Vehicle maintenance cost considered is ₹5.61 Crore for balance concession period. It is assumed that all required vehicles will be continuously available for the entire duration of the project. & following items considered for preventive maintenance work:

- **Maintenance Costs:** Assumed at 2.5% of the vehicle cost annually, accounting for regular upkeep and minor repair work.
- **Insurance Costs:** Estimated at 3% of the vehicle cost each year, ensuring coverage for accidents and associated liabilities.
- **Fuel Costs:** Projected based on typical fuel consumption patterns and prevailing fuel rates, with provisions for future price variability.
- **Price Escalation:** Incorporated across maintenance, insurance, and fuel components to reflect anticipated inflation and market shifts over the seven-year duration**.**

Details of Vehicle maintenance cost is tabulated in below **Exhibit 44.**

Exhibit 44 Vehicle Maintenance cost

Vehicle Maintenance Cost (₹-Crore)			
Year in Nos	**Years**	**Vehicles**	**Remarks**
			An annual escalation rate of 10% has been factored in each year.
1	FY26	0.7	
2	FY27	0.8	
3	FY28	0.9	
4	FY29	1.0	
5	FY30	1.1	
6	FY31	1.2	
Total Cost (₹- Crore)		**5.61**	

Above cost is including of GST

Breakdown of Vehicle Maintenance Costs:

- **Routine Maintenance**: Includes yearly expenses for regular servicing, part replacements, and minor repairs.
- **Insurance Premiums**: Calculated annually based on the vehicle's value and the required coverage.
- **Fuel Expenses**: Projected based on average fuel consumption and anticipated price escalation over time.

6.7 Civil work cost

Total Civil work cost considered is ₹12.33 Crore for balance concession period.

The civil cost component encompasses essential maintenance and repair activities for the tunnel and related infrastructure. The key elements include:

- **Painting**: Tunnel walls up to 4 meters high will be painted, with 30% of the total area refreshed annually to maintain appearance and structural integrity.
- **Bitumen and Concreting**: Includes roof concreting and waterproofing for the pump house and portal building, using a 50 mm concrete layer.
- **Grouting**: Applied to 20% of the tunnel length for crack repairs, with 20 nipples per location and 0.5 kg of epoxy per nipple. For water seepage, grouting is done on 2% of the tunnel length under similar specifications.
- **Drain Cleaning**: 25% of surface and main drains will be cleaned each year to ensure effective drainage and prevent clogging.
- **Instrumentation**: Installation of 1,000 crack meters is planned, with a dedicated instrumentation engineer stationed on-site to oversee monitoring and maintenance.
- **Miscellaneous Costs**: 10% of total civil expenses are reserved for unforeseen requirements and minor repair works.

Following items considered for Civil work:

- **Painting**: Includes costs for paint materials, labor, and equipment required for scheduled annual painting works.
- **Bitumen and Concreting**: Detailed cost allocation for concrete materials, waterproofing compounds, and associated labor charges.
- **Grouting**: Covers expenses for epoxy/resin materials, labor, and tools used for crack and water seepage grouting activities.
- **Drain Cleaning**: Encompasses labor, machinery, and waste removal costs for routine cleaning of surface and main drainage systems.
- **Instrumentation**: Costs related to procurement and installation of crack meters, along with the salary of an on-site instrumentation engineer.
- **Miscellaneous**: Budget provision for unforeseen repairs and incidental civil maintenance requirements.

The below **Exhibit 45** presents a detailed breakdown of costs related to manpower, vehicle maintenance, and civil works. It outlines specific estimates for each component across the seven-year period from FY 2026 to FY 2031, providing a comprehensive overview of all expenses associated with the operation and maintenance of the tunnel.

Exhibit 45 Civil Work Cost (₹-Crore)

S.No.	Description		FY26	FY27	FY28	FY29	FY30	FY31	Total Cost
1	***Painting***				3,54,13,735				**3,54,13,736**

Total Cost			**1,17,03,950**	**1,25,56,768**	**5,24,27,746**	**1,44,56,306**	**1,55,12,891**	**1,66,47,901**	**12,33,05,561**

Average Civil work Cost estimated is ₹1.86 Crore per year including GST.

6.8 Electrical and Mechanical (E & M) Cost

Total E & M Cost estimated is ₹26.82 crore for balance concession period including GST.

The following considerations have been made during calculation of E & M costs:

- **Component Replacement Costs:** Several parts of the Electrical & Mechanical (E&M) systems—particularly energy storage units—have defined operational lifespans and will require periodic replacement. These costs are essential to include in the Life Cycle Cost (LCC) analysis to accurately reflect future financial requirements.
- **Annual Maintenance for MEP Equipment:** Includes detailed costs for regular maintenance activities such as routine servicing, minor repairs, and replacement of worn-out components.
- **Annual Consumable Costs:** Covers frequently used items like lubricants, filters, lighting fixtures, and other expendables that are consumed during daily operations. These are non-repairable parts that must be replaced regularly.
- **Additional Electromechanical Works:** Accounts for costs related to enhancements necessary for ensuring effective functioning of the tunnel ventilation during fire incidents, protective measures for E&M systems, and fire safety provisions for critical areas like tunnel control rooms.
- **Annual Electricity Costs:** Reflects average yearly electricity expenses factored into the overall cost estimation.

Exhibit 46 Details of Total E & M Cost (₹-Crore)

Electrical & Mechanical Cost			
Year in Nos	**Years**	**Electrical & mechanical (₹-Crore)**	**Remarks**
1	FY26	3.56	
2	FY27	3.9	
3	FY28	4.2	
4	FY29	4.6	
5	FY30	5.0	
6	FY31	5.5	
Total E & M Cost (₹- Crore)		**26.82**	

Exhibit 47 Breakup of Yearly E & M Cost (₹-Crore)

S.nos	Items	Monthly Cost (₹-crore)
1	O&M Reports	0.18
2	O&M of Tunnel Ventilation System	0.71
3	O&M of MEP & SCADA	1.43
4	Miscellaneous	0.36
5	Energy Cost	0.89
Total Annual Cost (Annually)		3.56

Price Escalation: ***9% applied to replacement, maintenance, and spare consumable cost to account for inflation and other market changes over the 6-year periods.***

- **Tunnel Ventilation System:**

The tunnel ventilation system includes key components such as **Axial Flow Fans, Jet Fans, Dampers, and Attenuators**. Axial Flow Fans are primarily used for moving large volumes of air efficiently along the tunnel's length. Jet Fans are installed within the tunnel to provide longitudinal ventilation by pushing air in the direction of traffic flow. Dampers help regulate and control airflow by opening or closing specific ventilation pathways. Attenuators are used to reduce noise generated by the ventilation equipment, ensuring quieter and more efficient tunnel operations.

- **O & M of MEE & SCADA**

The tunnel's electrical and mechanical infrastructure comprises a range of essential components, including **Cable Trays**, **HV (High Voltage) Cables**, and **LV (Low Voltage) Cables** for power distribution. **Electrical Panels** and **Transformers** play a crucial role in regulating and managing electrical supply. Backup power is ensured through a **DG Set** and **UPS (Uninterruptible Power Supply)** systems.

For lighting and visibility, a robust **Lighting** setup is installed throughout the tunnel. **Fire Fighting Pipes**, **Pumps**, and **Valves** form the core of the fire suppression system, ensuring safety during emergencies. The HVAC system includes **HVAC Dampers**, **VRF (Variable Refrigerant Flow) units**, and **Extraction Fans** to manage air quality and temperature control. Additionally, **SCADA-PLC**

systems provide automation and centralized monitoring of all tunnel operations, enhancing safety and efficiency.

The average Electrical & Mechanical (E&M) Cost as per calculation is ₹6.83 Crore per year, which seems reasonable as per industrial practice.

6.9 Toll Plaza TMS Cost

The total cost estimated towards Toll Plaza TMS is ₹1.2 Crore per including GST.

The cost estimation for the **Agency for Toll Plaza TMS** spans from FY26 to FY31, starting at ₹0.15 million in FY26 and increasing annually by approximately 9%, reaching ₹0.20 million by FY31. This escalation accounts for inflation and cost adjustments over time.

☛ ***The cost considered for the Toll Plaza TMS is based on the purchase order issued to Techsture Technologies, the agency appointed by the concessionaire.***

6.10 Major Maintenance Cost

As mentioned in earlier chapter, Currently, the Project Highway is maintained by existing Annuity Concessionaire.

Based on RI & FWD Test results, SPV team made 01 MM cycles for the overlay of projects. Following items were considered during each MM cycle based on the ground requirements.

A. Flexible Pavement

- Overlay of 30-40 mm BC on MCW based on ground conditions and Test results.
- Overlay of 30 mm BC on service road considered.

B. Rigid Pavement

- Dismantling for existing PQC
- Relaying of dismantled panels
- Grouting with cement mortar
- Replacement and relaying of joints
- Diamond grinding with texturing

C. Replacement of Wearing Coat on structures

It is assumed that the pavement will be overlaid before handing over of the project confirming the pavement parameters kept within the limits as per Detailed strategy at **Exhibit 48.** Hence, the major maintenance cycles are proposed between year 2029.

6.11 Major Maintenance items

Based on detailed highway inventory carried out during site investigation and data provided by the concessionaire following items considered during major maintenance work

- Bituminous concrete for MCW using VG-30
- Dense Bituminous Macadam for MCW using VG-30
- Bituminous concrete for Service Road using VG-30
- Dense Bituminous Macadam for MCW using VG-30
- Micro surfacing
- Repair of Transverse & Longitudinal joints on MCW & Service Road for Rigid pavement area
- Joint Sealant replacement of rigid area
- PQC taxing for rigid pavement area
- Removal & Relaying of Panels
- Crack Sealing

6.12 Major Maintenance items

Major maintenance works to be considered in 01 cycles to the year 2029. A total Cost of ₹28.18 crore (Without Escalation) considered for major maintenance work Upto end of Concession period. Major maintenance Strategy is shown in **Exhibit 48. Detailed Cost Estimate attached as Annexure A.**

Exhibit 48 Major Maintenance Cycles & Cost

Major Maintenance Strategy & Cost Details for QB Project			
Cycle	**Year**	**Strategy**	**KF Cost (₹-Crore)**
MM Cycle-01	**(Year 2029)**	**A) Main Carriageway:** 01. 40 mm BC: 50% Length 02. 30 mm BC: 50% Length 03. 50mm DBM Rehabilitation: 5% Area 04. Road Marking: 100% Length 05. Kerb Painting: 100% Length 06. Kerb Raising: 100% Length 07. Manhole Repair: 100% **B) Service Road:** 01. 30 mm BC on 100% length	28.18

Major Maintenance Strategy & Cost Details for QB Project

		02. Road Marking 100% length **<u>C) Rigid-MCW</u>** 01. 5% Slab Replacement 02. 100% Joint Replacement 03. 100% Retexturing & Grinding 04. 100% Micro surfacing	
Total MMR Cost (₹-Crore) with GST			**28.18**

6.13 Summary of Cost

Different O&M cost have been worked out based on the investigations and assessment on Project Road. Cost for each of the category has already discussed in previous sections. Since the forecasting has been carried out for remaining concession period, the cost is summaries yearly for remaining concession period as below.

Exhibit 49 Summary of Cost

S.No.	Year of expense		FY26	FY27	FY28	FY29	FY30	FY31	Total Cost
1	**Routine O&M Cost**								
1.1	Manpower		10.8	11.9	13	14.4	15.8	17.4	83.20
1.2	Vehicles		0.7	0.8	0.9	1	1.1	1.2	5.61
1.3	Civil		1.2	1.3	5.2	1.4	1.6	1.7	12.33
1.4	Electro & Mechanical		3.6	3.9	4.2	4.6	5	5.5	26.82
1.5	Agency for Toll Plaza TMS		0.1	0.2	0.2	0.2	0.2	0.2	1.04

1 INTRODUCTION

1.1 Background

Cube Highways Fund Advisors Pvt. Ltd. (hereinafter referred as "the Client") is the Investment Manager of the Cube Highways Trust ("Trust" or "InvIT"). The Trust is registered with Securities and Exchange Board of India ("SEBI") as an Infrastructure Investment Trust under the SEBI InVIT Regulations. Cube Highways Fund Advisors Pvt. Ltd. has appointed **M/s. FP Project Management Consultancy Services Private Limited** (hereinafter referred as "Technical Consultant" or "FPPM") to carry out Technical Due Diligence of Madurai to Kanyakumari section (Package-III) km. 116+500 to km. 180+000 in the State of Tamil Nādu (hereinafter referred as "Project Road").

Salaipudhur Madurai Tollway Private Limited (hereinafter referred as "Concessionaire") is a special purpose vehicle (SPV) for tolling, operation, maintenance, and transfer of Madurai to Kanyakumari Section (from km. 116+500 to km. 180+000) of NH-44. The project was awarded to Concessionaire on 20th October 2020.The length of Project Road is 63.50 kms with one toll plaza at Salaipudhur Village at km. 125+350.

Accordingly, Technical Consultant has undertaken the work of assessment of operation and maintenance (O&M) cost based on site inspections and filed investigations. The same is presented in this report.

1.2 Scope of Work

The detailed scope of work for conducting the technical due diligence of Project Road is presented as below:

- A reconnaissance of the Project Road to understand the current condition of the pavement, structures, road furniture, toll plaza and other highway assets
- Review and assessment of important technical documents like CA, pavement design report, O&M report, DPR, As-built drawings, O&M manual, COD / PCOD certificate, punch list, previous major maintenance etc.
- Review of recent pavement investigations and surveys conducted on Project Road like FWD, NSV, Axle load, material investigations etc.
- Formulation of future major maintenance strategy
- Estimation of any initial expenses to be incurred due to deficiencies observed in diligence.
- Estimation of Routine Maintenance and Major Maintenance forecast for remaining concession period
- Estimation of Annual Operation expenses along with Systems cost (TMS / HTMS) till the end of concession period.
- Review of balance work cost for Project Road including estimation of quantities and item rates.

1.3 Our Approach Philosophy

1.3.1 Composition of Team

Our team consists of well-qualified engineers and other professionals, whose experience covers all the skills and specializations required for undertaking such assignments. All the team personnel proposed are our regular employees and have a long and stable working relationship with our firm.

The Team Leader coordinates the activities between all the key staff who work closely together. The key staff is assisted by various support staff, who report to the respective key staff in their field of expertise. The Team Leader is the point of contact for Client on Technical Study.

The technical study includes review of all the available documents namely:

a) Concession Agreement including Technical Schedules
b) O&M Contract, work order and their provisions
c) Quality of construction based on available data, design, and drawings
d) Documents on historical expenditure on operation and maintenance
e) O&M cost schedule for the concession period
f) Review of Completion / Provisional Completion along with punch list items
g) Review of recent pavement surveys conducted
h) Correspondence regarding scope of works and during O&M
i) Recent O&M Report submitted to Authority
j) Toll operation manual / ATMS related documents

The review of above documents is the first step towards accomplishment of the task. This gives a complete idea of the project and is used as input data for preparation of report after necessary analysis.

1.3.2 Site Visit and Data Collection

A team of experts from various streams has carried out the preliminary site visit to understand the assessment of project assets, mainly condition of the pavement and structures.

- The site visit is undertaken for detailed reconnaissance and visual pavement condition assessment.
- The condition assessment of major structures by visual inspection
- The information like material sources and the probable cost is collected for the purpose of cost estimate.

The detailed design / drawings viz. Plan & L-sections, drainage design, structure design, layout drawings for project facilities like toll plaza, bus bay, truck lay-byes, highway lighting facilities etc. are studied. Also, design / drawing and provision pertaining to road furniture are studied.

The information on availability of material in the vicinity is gathered. It has direct impact on cost of maintenance work and balance work.

The basic approach for preparation of cost estimates for operation and maintenance is as per the practice of State PWD / MORT&H in respect of highways and structures.

1.3.3 Data Analysis

Based on the study of the available information and preliminary site visits, the consultants share their preliminary observations with the Client based on the evaluation of the technical data and reports provided by the Client.

1.4 Structure of the Report

This report has been prepared based on the information, reports and documents made available to us by the Company. We have also referred to publicly available reports, literature etc. and have made our best efforts to check the authenticity of the information available, analyze the same as per the best engineering / industry practices.

The site visit and inspection were carried out from **17th March 2026 to 18th March 2026**.

The report is organized with the following chapters for easy understanding of various issues.

Chapter 1 **Introduction:** The chapter gives an overview of the project background, detailed scope of work, approach, and methodology for due diligence studies.

Chapter 2 **Project Description:** The chapter describes existing project features, and overview of project development.

Chapter 3 **Condition Assessment of Project Road:** The chapter presents the details and condition of various essential features of the Project Road based on site visit.

Chapter 4 **Pavement Investigation and Assessment:** The chapter describes the summary of pavement surveys and investigations carried out on Project Road along with the requirement of pavement maintenance.

Chapter 5 **Cost Estimates:** The chapter summarizes the forecasting of O&M and major maintenance costs over the remaining concession period.

2 PROJECT DESCRIPTION

2.1 Introduction

National Highways Authority of India signed the Concession Agreement with **Salaipudhur Madurai Tollway Private Limited** is a company promoted by Cube Highways or a Special Purpose Vehicle (SPV) formed for implementing this project on 27th December 2019. The Appointed Date for the Project Road is 20th October 2020.

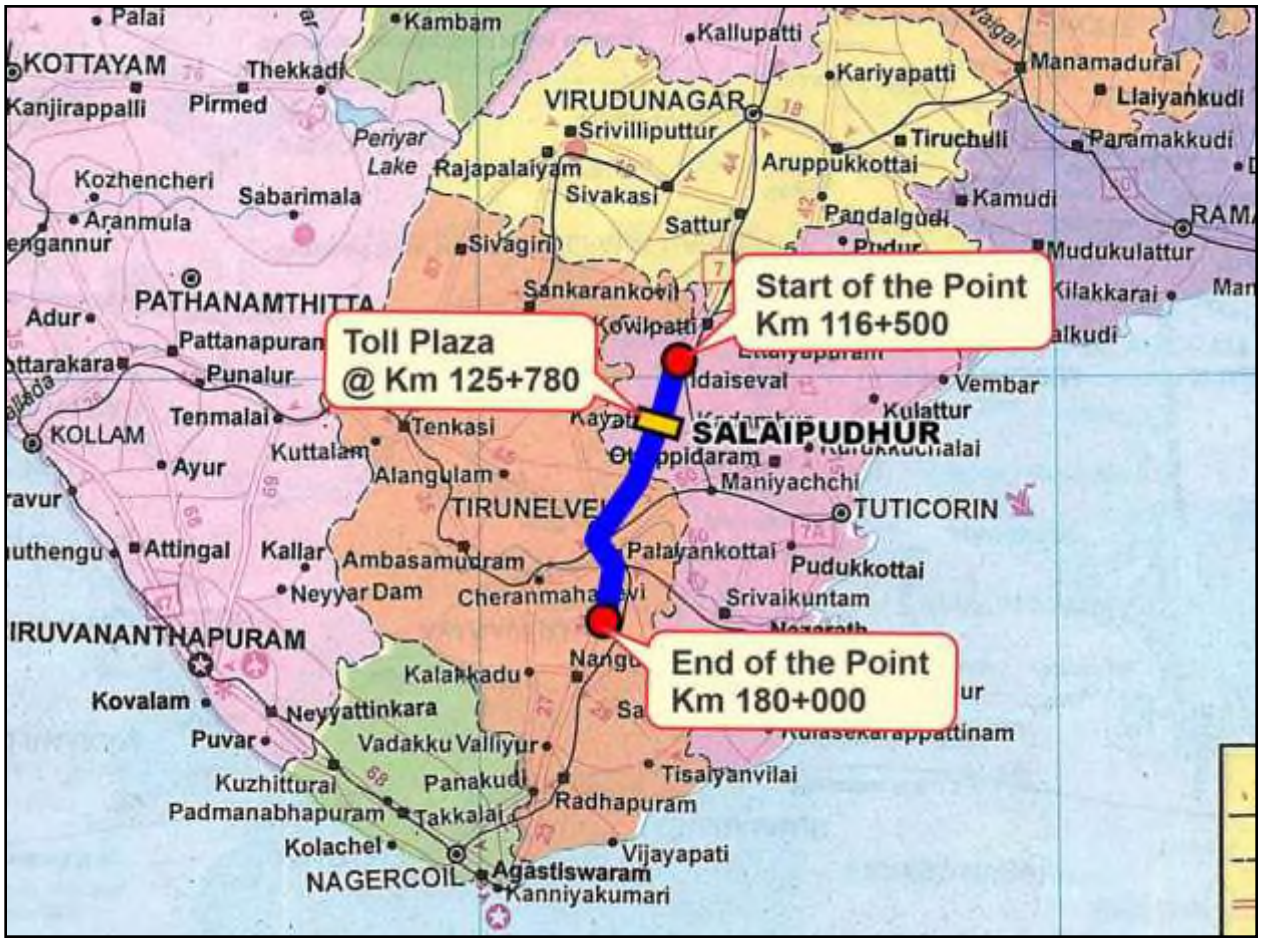
The project is being developed under TOT (Toll Operate Transfer) Bundle-3 with concession period of 30 years from the Appointed Date. The end of the concession period is 21st October 2050.

2.2 Location

The Project Road is part of National Highway No. 44 (old NH-7) of Madurai - Kanyakumari section in the state of Tamil Nādu. The total project length is 63.50 kms.

The Location Map of the Project Road is presented below:

Figure 2-1 Location Map



The photographs taken during the site visit are presented below.

Figure 2-2 Start and End of Project Road

Start of Project Road at km. 116+500

End of Project Road at km. 180+000

2.3 Climate

The project area being in the region of southeast of the western ghats, the area is hot and dry. Temperatures range between a maximum of 37 °C and a minimum of 22 °C. April to June are the hottest months and December and January are the coldest with temperatures rising towards the end of February. Rainfall occurs mostly during the north-east monsoon in the months of October to December. However, the project stretch receives little rainfall, averaging 840 mm. Annual rainfall has ranged from 964 mm to 228 mm during past decades.

2.4 Terrain

The Project Road, traverses through plain terrain.

2.5 Abutting Land Use

The land use along the Project Road is predominantly agriculture or barren with intermittent built-up area.

2.6 Right of Way

The width of the existing Right of Way (ROW) for the Project Road is 60 m throughout its length.

2.7 Existing Utilities

During widening of the Project Road, various affected utility services were shifted to proposed ROW. The different types of utilities found along the road include, electrical poles, telephone poles, OFC cables, etc.

2.8 Development as per Schedule-B

The Project Road from Kayathar (km. 116+500) to Nanguneri village (km. 180+000) has been developed as a four-lane divided carriageway with median width of 2 m, service road at some built-up locations and other arrangements. The Project Road passes through rural as well as built-up sections.

Following is the Scope of Work as per Schedule-B of Concession Agreement.

Table 2-1 Details of Scope of Work

Sr. No.	Type of Structure	Unit	Scope	Remark
1	O&M of Main Carriageway	km.	63.50	
2	Construction of Service Road	km.	3.02	Total (LHS+RHS)
3	Repair & rehabilitation of Major Bridges	Nos.	05	
4	Repair & rehabilitation of Minor Bridges	Nos.	17	
5	Repair & rehabilitation of Box Culvert	Nos.	24	
6	Repair & rehabilitation of Pipe Culvert	Nos.	86	
7	Repair & rehabilitation of Flyover	Nos.	01	
8	Repair & rehabilitation of ROB	Nos.	03	
9	Repair & rehabilitation Vehicular Underpass (VUP)	Nos.	16	
10	Junction Improvement	Nos.	10	
11	Provision of Unlined Drain	m	2501	Total (LHS+RHS)
12	Provision of RCC Cover Drain	m	150	RHS

3 CONDITION ASSESSMENT OF PROJECT ROAD

3.1 Pavement

The Project Road is four lane divided carriageway and generally has paved carriageway of 9.0 m with earthen shoulder of 1.5 m on either side. The Project Road has a median width of 2.0 m throughout its length.

The entire stretch of Project Road including service road is constructed with flexible pavement. The pavement type for the Toll Plaza including taper is of rigid pavement.

3.1.1 Pavement Condition Survey

Pavement condition survey was carried out from **17th March 2026 to 18th March 2026** through visual inspection for the entire project length. From the visual inspection, it is found that the average pavement condition of the Project Road is found to be Good.

Some of the photographs taken during the site visit are presented as below.

Figure 3-1 Photographs of Pavement Condition (MCW)

km. 122+700

3.2 Service Road / Slip Road

The service road with a width of 5.50 m is constructed in built-up areas and adjoining underpass locations. The Project Road has a total length of 46.040 km of existing and new service road (which includes service road on both sides).

Figure 3-2 Photographs of Service Road / Slip Road

Service Road at km. 127+650 (LHS)

Service Road at km. 169+450 (RHS)

3.3 Major / Minor Junctions

There are 03 nos. of major junctions and 31 nos. of minor junctions along Project Road. The junction details are presented in the table below.

Table 3-1 Details of Major Junctions

Sr. No.	Chainage (km)	Type of Junction	Name of Access Road		Surface Type of Access Road	
			LHS	RHS	LHS	RHS
1	138+720	Y	Old NH	-	BT	
2	142+450	T		Village		BT
3	144+350	T		Renacon		ER+BT

3.4 Condition Survey of Bridge

The inventory of structures including major bridges, minor bridges, ROB's, flyover, underpasses and culverts is presented in table as below:

Table 3-2 Details of Summary for Structures

Type of Structure	Total Number of Structures
Major Structures:	
Road Over Bridge (ROB)	03
Flyover	01
Major Bridges (MJB)	05
Minor Bridges (MNB)	17
Vehicular Underpass (VUP)	16
Culverts:	
Pipe Culverts	86
Box Culverts	24
Total	**152**

The detailed condition survey of structures was carried out by visual inspection. The observations and findings are presented in table below:

Table 3-3 Condition Survey of Major Structure

Sr. No.	Chainage (km)	Side	Span Arrangement (m)	Carriageway (m)	Deck Width (m)	Type of structure	Type of foundation	Remarks

3.5 Condition Survey of Culverts

The cross-drainage structure includes hume pipe culverts and box culverts at various locations. There are 110 Nos. of culverts along the Project Road. The height of culvert varies from 1.0 m to 3.0 m from bed level. During the condition survey of structure, these culverts were inspected on sample basis.

The project involves strengthening and widening of existing road to four lane divided carriageway. The culverts beneath existing alignment are either widened or reconstructed. The structural condition of culverts is generally found in sound condition. The quality of surface concrete of box culverts is satisfactory. The RCC parapet, crash barrier or RCC railing has been provided at culvert locations, which is maintained properly.

In most of culverts, the waterway is clear. However, near to urban area and some location is found blocked due to debris, drainage water or bushes, tree growth, which will be removed by the Concessionaire. The cement concrete pitching or stone pitching has been provided for slope protection.

The culverts are maintained by the Concessionaire during O&M period. However, in case of few culverts, cement concrete pitching has been damaged which required to be addressed under routine repair work by the Concessionaire.

The photographs taken during site visit is presented as below.

Figure 3-5 Photographs of Culverts

Pipe culvert at km. 122+835

Box culvert at km. 123+180

3.6 Drainage

There are 6.030 kms of existing drain (which includes drain on both sides) of the Project Road. However, 0.150 kms of RCC drain is additionally constructed in locations where service roads are provided.

3.7 Slope Protection

Slope protection and chute drains are found on Project Road at required locations. A few of the slope protection and chute drains are damaged which need to be rectified by the Concessionaire.

3.8 Road Furniture

The Concessionaire has provided additional road furniture along the Project Road as per the standards and specifications mentioned in Schedule-C. The details of the items are provided below.

a) Lighting Along the Project Road

Highway lighting is provided at underpasses, flyovers, toll plaza, ROBs and built-up locations. High mast lighting is provided at toll plaza location. Highway lighting is also provided at approaches of underpass and flyovers.

b) Transverse / Thermoplastic Bar Marking Locations

Transverse / Thermoplastic Bar Markings on either side of carriageway is provided as per Section 11.2 of IRC:35-2015.

c) New Installation of Safety Barriers

There are 3015 m of new installation of safety barriers installed by the Concessionaire along the Project Road.

d) Additional Gantry / Cantilever Sign Board

As per schedule-B, additional gantry/ cantilever sign is provided at the following locations.

Table 3-4 Details of Additional Gantry / Cantilever Sign

Sr. No.	Chainage (km)	Side	Location	Type
1	130+600	BHS	Underpass	Cantilever Gantry Sign Board
2	140+500	BHS	Underpass	Cantilever Gantry Sign Board
3	159+000	BHS	Flyover	Cantilever Gantry Sign Board
4	166+550	BHS	Underpass	Cantilever Gantry Sign Board

Pavement Marking

Pavement marking for the Project Road is done as per the design standards indicated in section 12 of Schedule-D. Pavement marking is faded at some locations which will be rectified by the Concessionaire. Some of the photographs of road marking are presented below.

Figure 3-6 Photographs of Pavement Marking

km. 126+800

km. 127+100

km. 156+210

km. 157+650

Road Studs

Road studs / Cat's eye for the Project Road is provided as per the design standards indicated in section 12 of Schedule-D. Road studs / Cat's eye has been fixed at junction and zebra crossings. However, at a few locations some cat eyes have been damaged, which will be rectified by the Concessionaire.

Traffic Signage / Median Kerb painting / KM Stone

Traffic signs includes roadside signs, overhead signs, kerb mounted signs and median signs along the Project Road. The design for the traffic signs along the Project Road is done as per the design standards.

The height, lateral clearance, location and installation are as per relevant clauses of Schedule 'D'. Overhead sign has been installed ahead of major intersections, toll plazas, start / end of Project Road and urban areas as per detailed design requirements.

Roadside signs, overhead signs, kerb mounted signs, Kilometre stones, vertical post of sign boards, chevron boards and median kerb paint are all in good condition.

Some of the photographs of sign boards are presented below.

Figure 3-7 Photographs of Sign Boards

Informatory warning board at km.118+440

Gantry board with name & direction at km.126+400

Km stone at km. 140+000

Hectometer stone at km. 128+200

Direction name board at km. 157+650

Indicative signage for median opening at km. 139+600

Highway Lighting

Highway lighting is provided at underpasses, flyovers, toll plaza, ROBs and built-up locations. High mast lighting is provided at toll plaza location. Highway lighting is also provided at approaches of underpass and flyovers.

Figure 3-8 Photographs of Highway Lighting

km.124+210

km. 160+400

Crash Barriers

Metal beam crash barriers are provided at bridge approaches, locations of high embankment and sharp curves. All the crash barriers provided by the Concessionaire are maintained at site.

Some of the photographs of metal beam crash barriers are presented below.

Figure 3-9 Photographs of MBCB / Crash Barrier

km. 123+200 (LHS)

km. 127+950 (RHS)

Delineators

The traffic delineators are provided by Concessionaire for road users in abnormal condition of weather for the Project Road. The same is maintained by the Concessionaire. Some of the photographs of delineators are presented below.

Figure 3-10 Photographs of Delineator

km. 125+400 (RHS)

km. 126+400 (LHS)

Pedestrian Guard Rail

The pedestrian guard rails are provided in the median. It is maintained by the Concessionaire.

Some of the photographs of pedestrian guard rails are presented below.

Figure 3-11 Photographs of Pedestrian Guard Rail

km. 142+020 (Service roadside)

km. 153+350 (Median portion)

Road Land Boundary

Road land boundary pillar has been found / available on Project Road.

3.9 Avenue Plantation and Median Plantation

Avenue plantations are done in open country location and median plantation has been provided in the project length as per IRC specification.

Some of the photographs taken during the site visit are presented below.

Figure 3-12 Photographs of Avenue Plantation

3.10 Toll Plaza

As per the Concession Agreement, there is one existing toll plaza at Salaipudhur Village at km. 125+350 with the following infrastructure.

Table 3-5 Details of Summary for Toll Plaza Items

Sr. No.	Particulars	Details
1	Toll Plaza Chainage	km. 125+350
2	Number of Tolling Lanes	8 lanes for toll operation plus 2 lanes for over dimensional vehicles.
3	Weigh in Motion Facility (Number of Lanes)	Yes
4	No. of ETC Lanes	in each direction
5	Number of Toll Booths	9 singles
6	Canopy	Present
7	Administrative Building	Present
8	Parking cum Toilet Block	Present
9	Availability of Tunnel or Elevated Walkway for Movement between Toll Lanes and Administrative Building	Tunnel/no
10	Availability of Static Weigh Bridge	Yes
11	Availability of Loading/Unloading Facility for Overloaded Vehicles	No
12	Storage facility for Overloaded Material	No
13	High mast Light	Yes
14	Streetlight	Yes
15	Low mast Light	No
16	User Fee Boards	4
17	Cantilever/Gantry Boards	Yes
18	Automatic boom barrier	Yes

Figure 3-14 Photographs of Toll Plaza

Toll Plaza at km. 125+350

Toll Plaza at km. 125+350

3.11 Lane Equipment

Following are the lane hardware and equipment installed at toll plaza.

1. RFID ETC Transceiver
2. Lane Controller with Industrial PC
3. AVC Sensors
4. Automatic Lane Barrier (ALB)
5. Lane Traffic Light and user fare display
6. Incident Capture Camera
7. Overhead Lane Signals
8. Traffic Lights
9. Toll Booth Equipment

3.11.1 RFID ETC Transceiver

RFID ETC Transceiver reads tags installed on the windshield of vehicles and mounted on a pole at about 6 m height. Handheld RFID readers are provided (1 no. in each direction).

RFID

3.11.2 Lane Controller with Industrial PC

Toll Lane Controller is located within the Electronic Enclosure placed inside each toll booth which are connected to the common server and are capable of independent storage of data.

Lane Controller at Toll Plaza

3.11.3 Automatic Vehicle Classification (AVC) Sensors

The AVC equipment comprises of a pair of height sensor poles, axle sensors and inductive loops. The height detector has a high sensing resolution and detects height when object blocks the path. The presence of vehicle is detected by inductive loop. The loop sensors embedded on the pavement trigger the AVC height sensors located on parallel pillars.

AVCC at Toll Plaza

3.11.4 Automatic Lane Barrier

Boom barriers installed on all lanes are in working condition and have a working time of 0.6 - 0.9 s. Automatic Lane Barrier is used to allow only authorized vehicles to pass through the lane. The barrier is activated only on generation of user fee receipt or other relevant vehicle processing activity. A torque motor powers the barrier for raising and lowering the boom. The motor can be blocked at any position without causing any damage. In the event of power failure, the boom is automatically raised. The boom weight is exactly balanced by built-in springs.

ALB at Toll Plaza

3.11.5 Lane Traffic Light (LTL) and User Fare Display (UFD)

Lane Traffic Light (LTL) is used to instruct vehicles to stop or pass through the lane. The LTL is RED when the toll collector is expecting the vehicle at the booth. After the transaction is done; the LTL turns Green to instruct the vehicle to pass through the lane. The User Fare Display is a part of electronic toll collection equipment located at the toll booth. It is a mini variable message sign (VMS) made of Light Emitting Diodes (LED). The user fare display is used to display the toll fare that is due and that must be paid by the motorist and the classification of vehicle selected by the collector.

LTL at Toll Plaza

3.11.6 Incident Capture Camera (AVC Camera)

The incident capture camera is installed on island of the booth to capture the image of the vehicle from the back side. The AVC triggers the Image capture system.

3.11.7 License Plate Image Capture Camera (LPIC)

License Plate Image capture camera is installed on a 3 m pole facing incoming vehicle to capture the image of the vehicle number plate.

3.11.8 Over Head Lane Signal (OHLS)

The **Overhead Lane Signal (OHLS)** for lane “Open” and “Close” sign consists of a pair of “GREEN” (arrow) and “RED” (cross) lights. The OHLS is located at the vehicle approaching side of the canopy to show the drivers whether the lane is open or closed.

OHLS at Toll Plaza

3.11.9 Toll Booth Equipment

Toll Booth Hardware / Equipment provided are:

- Toll Collector Display (Operator Monitor)
- Customized Industrial Keyboard
- Receipt Printer
- Intercom Slave unit
- Bar code reader
- Violation Light and alarm
- Manual Booth Control (MBC)
- Booth Camera

The operator monitor termed as Toll Collector Display (TCD) is located on the toll collector's desk. It is the system's interface to the toll collector, to display the status of transactions and status of the lane peripherals.

The keyboard on the toll terminal is a programmable keyboard for Registration of toll operations and is customized for different vehicle types and type of ticket.

Thermal printers are installed at the toll booths to print tickets. Intercom slave unit facilitates communication with the master unit located in the control room.

Violation system has an alarm switch which is triggered whenever there is a violation such as run-through happening on the lane. When there is an emergency, a foot switch pressed by the booth operator alerts the control room.

Booth Cameras are provided on the inside roof corner of the booth to provide surveillance through CCTV screen located in the control room. Manual Booth Controller is used to release exempt vehicles.

Toll Booth at Toll Plaza

3.11.10 Medium Speed Weigh in Motion (MSWIM)

Medium Speed Weigh in Motion (MSWIM) is installed on entry lanes of Toll Plaza.

MSWIM at Toll Plaza

3.12 Plaza Equipment

3.12.1 TMS Server

Plaza Server is provided in a hot standby configuration and provided with port non-POE network switch and Port PoE switch. Internet connectivity is available through one lease line (Airtel) and Jio WiFi module. Firewall with Sophos antivirus is provided.

3.12.2 55" LED screen for CCTV monitoring

55" LED screen for CCTV monitoring installed at the toll plaza admin block provides view of all the toll booths, important zones within the plaza where cash transactions take place (server room, control room, cash up).

The toll plaza manager is able to observe the activities at the toll lanes and toll booth. When the toll collector calls up on the intercom, the manager is able to comprehend the situation at the lane by a zoomed view of the particular lane.

3.12.3 Workstations in Control Room, POS room

Workstations are available in control room (lane monitoring, administration, and audit), cash room and PoS.

3.13 Advanced Traffic Management System (ATMS)

Advanced Traffic Management System (ATMS) installed for the Project Road is controlled by the ATMS center at the toll plaza location (km. 125.350). As per Concession Agreement, ATMS shall conform to ATMS Policy guidelines (2016) which comprises of the following:

- Automatic Traffic Counter cum Classifier (ATCC)
- Mobile Radio communication system
- Emergency Call Box
- Portable Weigh in Motion
- Meteorological Data system
- Variable Message Signboards (VMS)
- CCTV system

- Video Incident Detection System (VIDS)
- Vehicle actuated Speed Display (VASD)

Status of these systems at site are described below:

3.13.1 Automatic Traffic Counter cum classifier (ATCC)

Automatic Traffic Counter cum Classifiers (ATCC) is installed at Toll Plaza (km. 125+350).

3.13.2 Mobile Radio communication System (MRCS)

Mobile Radio communication System (MRCS) is not yet installed. Application for MRCS UHF band has been sought from WPC, DoT, Ministry of Communications which is not yet allocated.

3.13.3 Emergency Call Boxes (ECB)

ECB's are not installed at site.

3.13.4 Portable Weigh in Motion (PWIM)

PWIM's are provided at site.

3.13.5 MET System

Meteorological sensors comprise of sensors to measure the atmospheric temperature, humidity, pavement surface temperature, visibility and equipment for measuring wind speed and direction and installed at Toll Plaza km 125.350.

3.13.6 Variable Message Signboards (VMS)

Variable message sign boards are installed at 10 locations. These display specific messages to the users based on the prevailing conditions on the highway. The message can be changed at any point of time from the HTMS centre. About 250 customised messages can be stored on the system.

3.13.7 CCTV Surveillance Cameras

Surveillance cameras are installed at 34 locations along the Project Road. The ATMS control room has video wall to monitor these locations through the cameras installed.

3.13.8 Video Incident Detection System

45 nos. fixed CCTV cameras are installed as part of Video incident detection system.

3.13.9 Vehicle Actuated Speed Display (VASD)

VASD is installed at 11 locations each on LHS and RHS.

3.13.10 Adequacy of Toll Collection System and ATMS

- Adequacy-All lanes are hybrid ETC system as stipulated by NHAI in Technical Specifications of Hybrid ETC system. NHAI has approved maintenance costs for TMS. TMS shall be upgraded every 5 years at the cost of the Authority.

- Advanced Traffic Management System (ATMS) installed is as per specifications required by the Authority and in working condition.

3.14 Truck Lay-bye

The truck lay-bye are provided at the following locations on Project Road.

Table 3-6 Details of Truck Lay-bye

Sr. No.	Chainage (km)	Remarks
1	130+100	LHS
2	139+500	RHS

3.15 Traffic Aid Post and Medical Aid Post

Traffic Aid Post and Medical Aid Posts are present in the toll plaza location at 125.350.

3.16 Toilet Block

Toilet blocks are provided at the Toll Plaza on Project Road.

3.17 Bus Bays and Passenger Shelters

There are 36 Nos. of bus bays / shelter along the Project Road.

The photographs taken during the site visit are presented below.

Figure 3-15 Photographs of Passenger Shelter

3.18 Balance Work Status

There are no balance work to be executed as per the Concession Agreement.

It is to be noted that at present, at three different locations along the project highway, NHAI has allotted COS works to third party on stand-alone basis. In the said 02 locations, along the project length, underpass & approach construction is being carried out by the third party. Thus, a total length of 3.10 km of project length (where COS / new construction works are in progress), out of total project length of 53.50 kms, is not under the maintenance scope of the Concessionaire at present.

3.19 Operation and Maintenance

3.19.1 O&M Contract

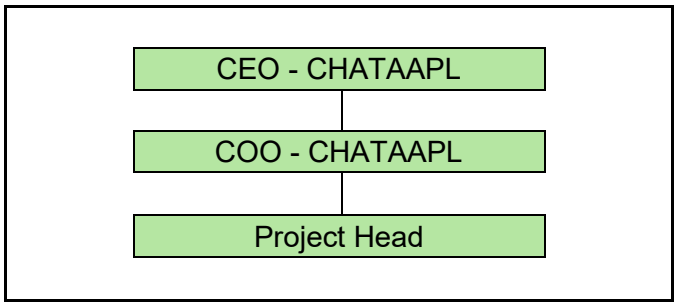
As per Concession Agreement, the Concessionaire shall operate and maintain the Project Road by itself, or through O&M Contractors and if required, modify, repair, improve the Project Road to comply with Specifications and Standards, and other requirements set forth in the Agreement through Good Industry Practice, Applicable Laws and Applicable Permits and manufacturer's guidelines and instructions with respect to toll systems. The Operation and Maintenance activities shall confirm to all the requirements laid down in MoRT&H, IRC Specifications and the Concession Agreement. The Concessionaire has outsourced for carrying out the activities related to operation and maintenance of the Project Road including toll operation services, security services, AMC for TMC and AMC for DG set.

3.19.2 Organization Chart

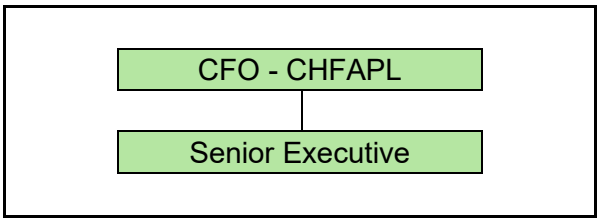
The Concessionaire has shared the Organization Chart at site for Operation and maintenance. Accordingly, there is 01 Project Head, 01 Senior Executive (HR), 01 Manager (TMS / IT), 01 Executive (TMS / IT), 01 supervisor , 01 executive, 01 electrician 01 Plaza Manager, 01 Assistant Plaza Manager, 03 Cashiers and 04 validators to carry

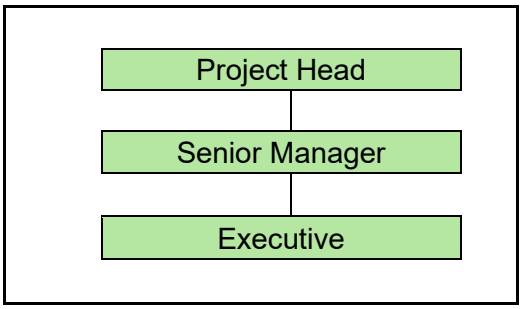
out O&M activities. The team controls the maintenance activities. However, the maintenance work is undertaken and executed through competent subcontractors.

Organization Chart

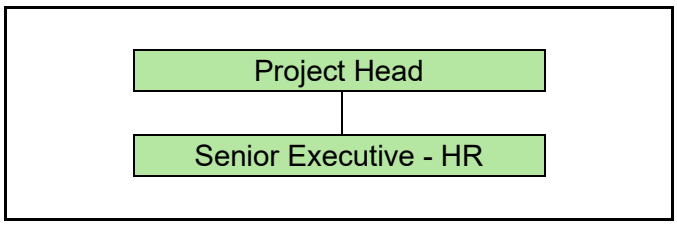


Finance & Accounts

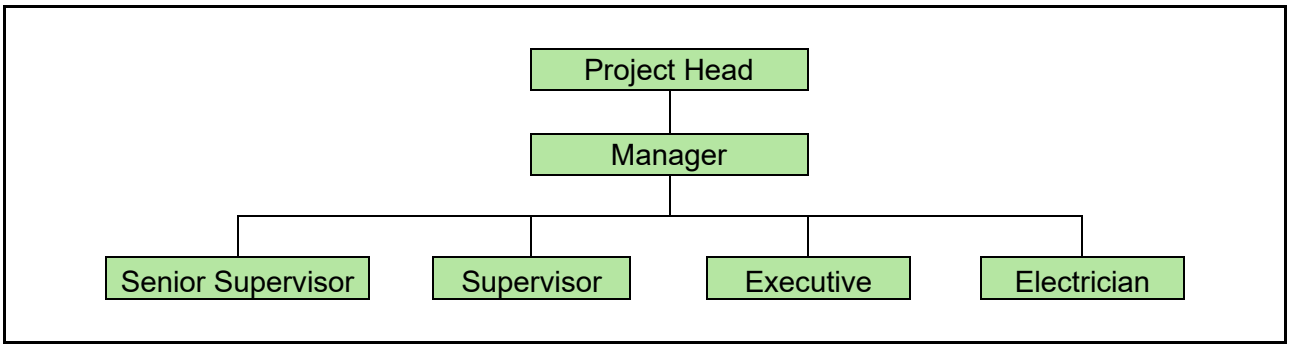




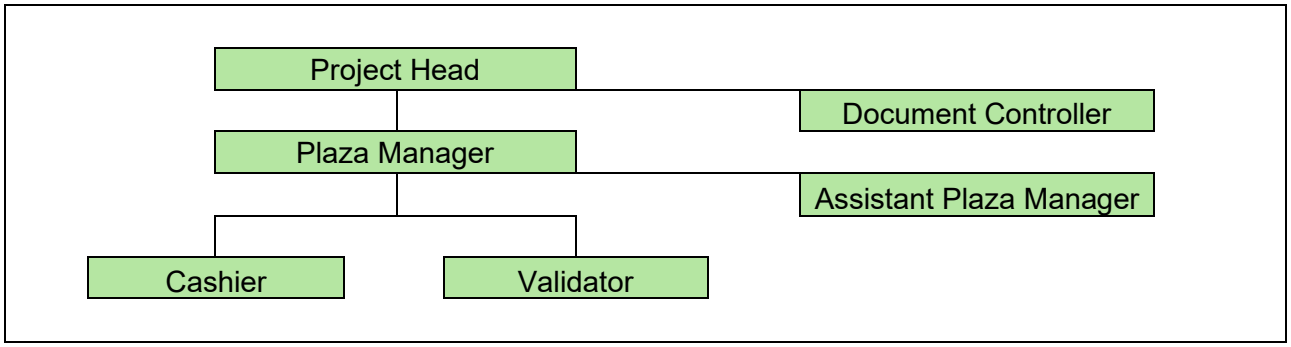
Human Resource



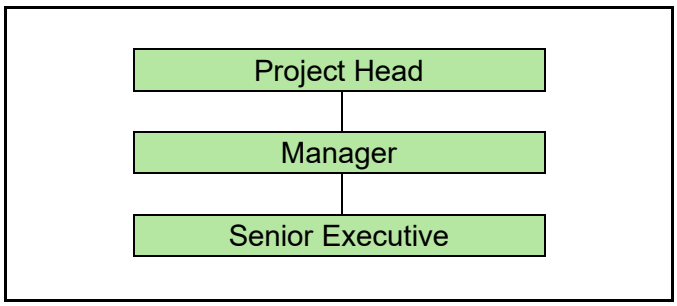
Operations & Maintenance



Operations System



Traffic and safety



3.19.3 Operation

Operation cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses and other miscellaneous expenses. The Concessionaire has provided the expenses occurred towards operation expenses for past years. Necessary assumptions have made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area.

The Operation Cost is presented in the subsequent chapter.

3.19.4 Routine Maintenance

The Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey.

Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Maintenance Cost is presented in the subsequent chapter.

4 PAVEMENT INVESTIGATION AND ASSESSMENT

4.1 General

Article 15 and Schedule-F of the Concession Agreement defines the Operation and Maintenance requirement during the concession period.

The project is currently under the Operation and Maintenance stage. The concession period of the project is 30 years from the Appointed Date (as TOT Package i.e., 20th October 2020) including construction period.

4.2 Axle Load and VDF

The Concessionaire has conducted the Axle Load Survey on Project Road at km. 125.780 (near Toll Plaza) from 17th March 2020 to 19th March 2020. The summary of Vehicle Damage Factor (VDF) calculated as provided by the Concessionaire is tabulated below.

Table 4-1 Vehicle Damage Factor

Weighted Average VDF Values			
Sr. No.	Vehicle Type	Direction	
		Madurai - Kanyakumari	Kanyakumari - Madurai
1	BUS	0.777	0.968
2	LCV	0.808	0.695
3	2-Axle	2.921	3.279
4	3-Axle	5.656	5.103
5	MAV	13.441	7.893

4.3 Design Traffic

Traffic in Million Standard Axles (MSA) for the homogeneous section based on the historical traffic data as provided by the Concessionaire, current traffic has been used for future projections and the estimated design MSA is computed and presented in subsequent table.

For the estimation of design MSA, Actual Traffic Growth Rates as provided by the Concessionaire were used.

Table 4-2 MSA Calculation

Year	MSA (LHS)	Cumulative MSA (LHS)	MSA (RHS)	Cumulative MSA (RHS)	Remarks
FY27	2.21	**2.21**	1.66	**1.66**

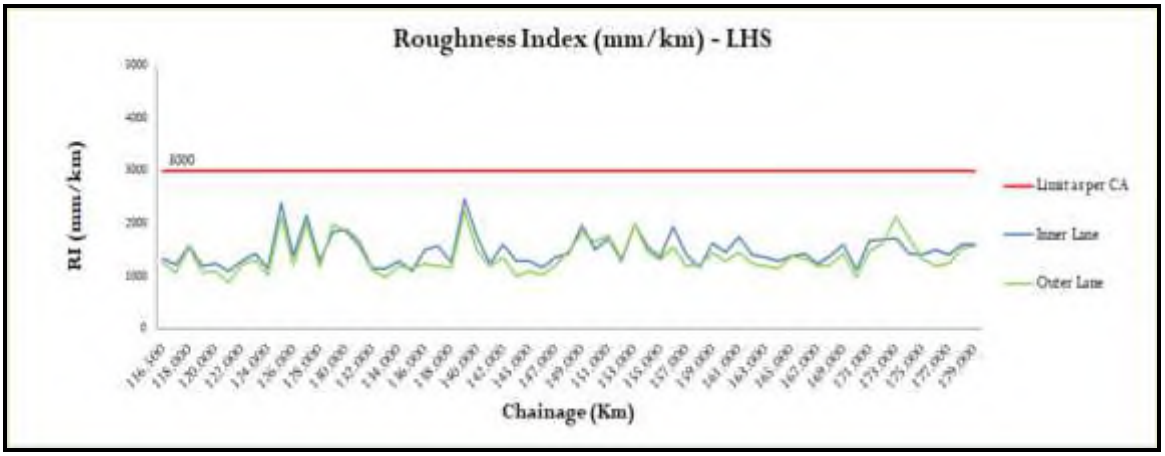
FY49	4.40	**74.28**	3.21	**54.75**	Augmentation 6-Laning (Assuming 3 years Construction Period)
FY50	3.62	**77.90**	2.64	**57.39**	
FY51	3.72	**81.62**	2.71	**60.10**	

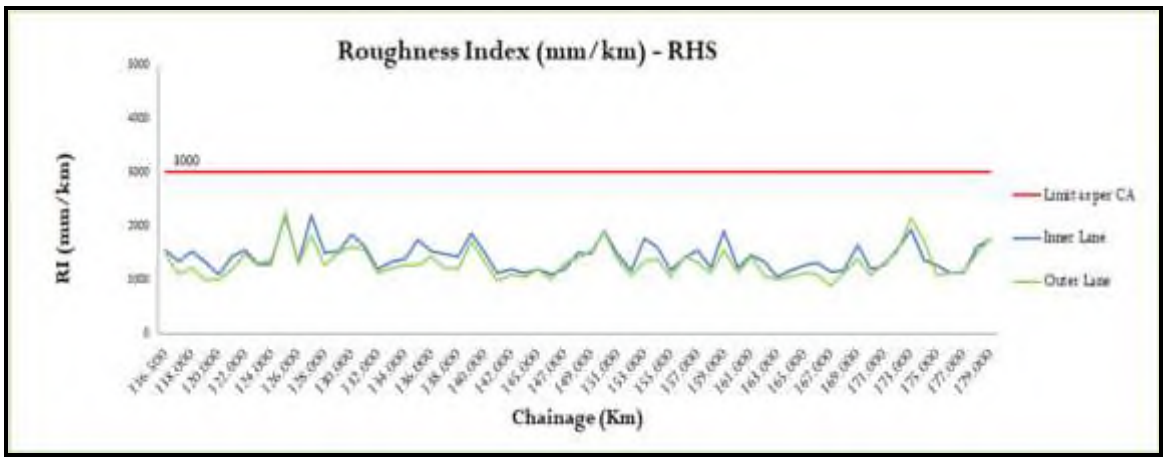
4.4 Network Survey Vehicles (NSV) Survey

The Concessionaire has conducted pavement condition survey on each lane of carriageway through NSV. The NSV survey was conducted on the Project Road on 1st March 2026. The summary of the same is presented below.

Table 2-3: Summarized condition of Roughness as per Concession Agreement for all lanes (MCW)

Roughness Summary % as per Schedule F of CA (mm/km) - MCW					
Condition	Limit as per Schedule F of Concession Agreement (mm/km)	LHS		RHS	
		Inner Lane	Outer Lane	Inner Lane	Outer Lane
Good	<3000	100.00%	100.00%	100.00%	100.00%
Poor	>3000	0.00%	0.00%	0.00%	0.00%

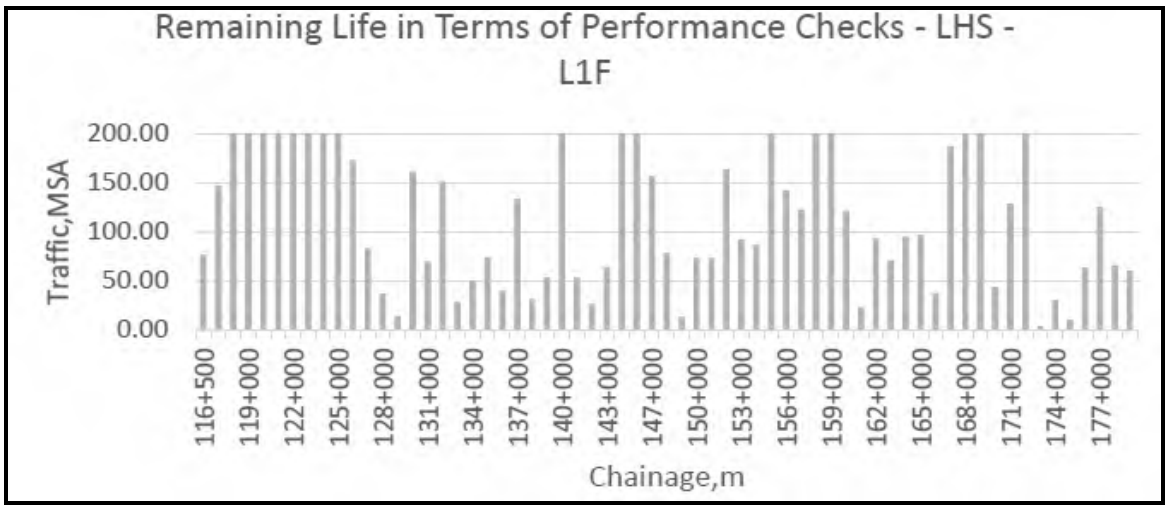


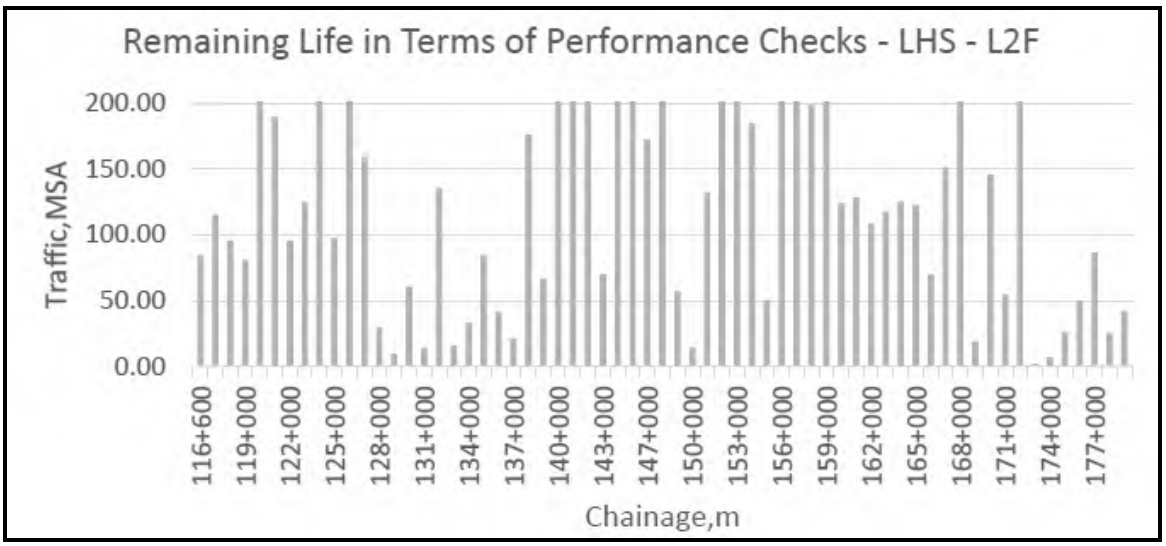


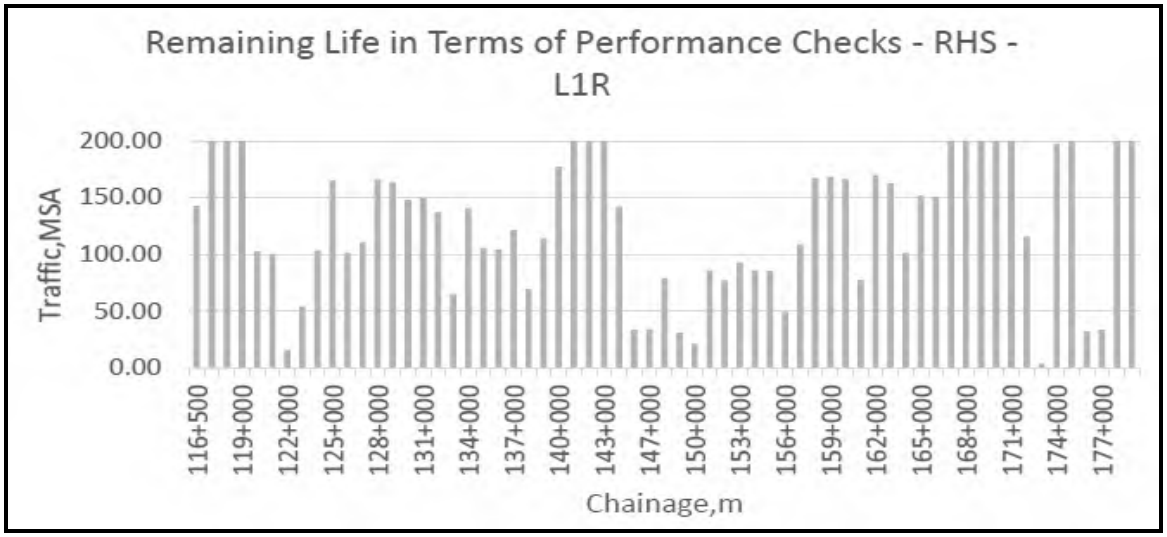
4.5 FWD Survey

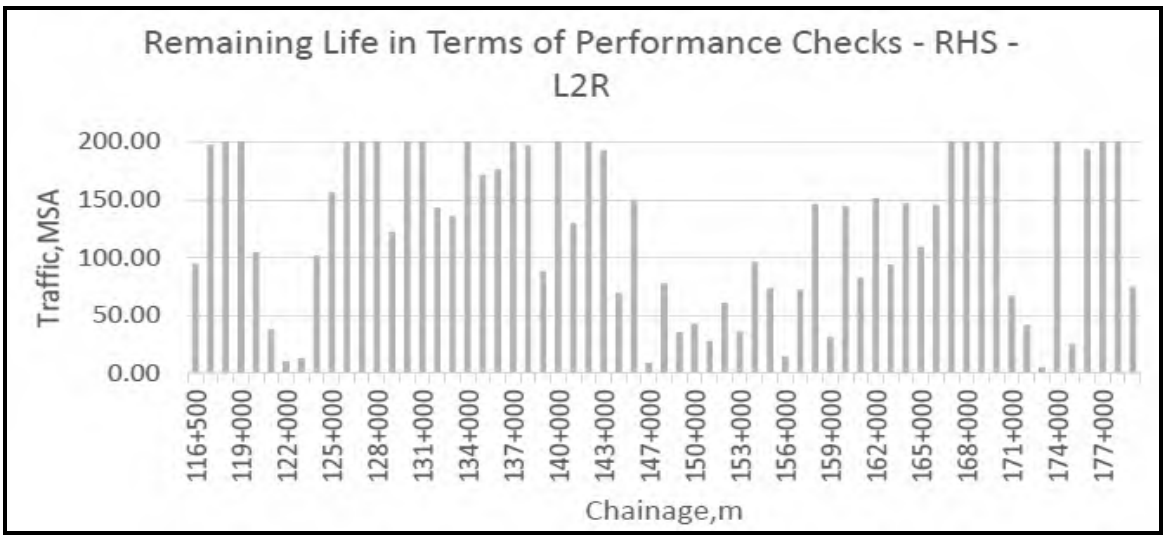
The structural evaluation and analysis of the remaining life of project was carried out in conformity with IRC:115-2014 “Guidelines for Structural Evaluation and Strengthening of Flexible Road Pavements Using Falling Weight Deflectometer (FWD) Technique”.

The FWD survey was conducted on the Project Road on 4th March 2026 to 09th March 2026. The summary of the same is presented below.









However, the maintenance can be carried out on as and when required basis and to the compliance of Schedule-F requirement to maintain the road in serviceable condition. However, improvement in Riding Quality is expected if the roughness value exceeds 3000 mm/km.

4.6 Test pit and Subgrade Investigation

The Concessionaire has carried out the subgrade investigation for Project Road. The results of the same as provided by the Concessionaire are tabulated as below.

Sr. No.	Road Name	Existing Chainage (km)	Side	DCP-CBR
1	NH-7	117+500	RHS	13.1
2	NH-7	120+000	LHS	24.3

4.7 Periodic Maintenance Strategy

Unlike the old Concession Agreements where periodicity and threshold limits were clearly described for the major maintenance, the Concession Agreement of this project does not specify the periodicity or the threshold limits for carrying out the full-length periodic maintenance. Schedule-F of the Concession Agreement specifies the threshold limits and the timeline for carrying out repairs to the distresses during the operation period.

The maintenance thus can be carried out as and when required basis and to the compliance of Schedule-F requirement to maintain the road in serviceable condition. Only improvement to Riding Quality is expected if the roughness value exceeds 3000 mm/km.

Overlay work is completed at site on both side of the carriageway in the month of October 2021 i.e., FY 2022. Thus, next cycle of the overlay is proposed in FY 2029 after 7 years from previous MM cycle.

As per Article 14 of CA, the Authority shall carry out capacity augmentation under EPC contract if traffic exceeds 40,000 PCU for three consecutive accounting years. As per the traffic study report submitted by the Company it is observed that the project traffic crosses 40,000 PCU in FY 2042, FY 2043, FY 2044. Assumption has made that execution of 6-laning of Project Road will start in the year 2047 or 2048. It is also assumed that during 6-laning of Project Road, the overlay of existing four lane road will be part of the capacity augmentation. Hence, the major maintenance cycle is adjusted accordingly.

The table below shows the major / periodic maintenance cycle throughout the concession period for the Project Road.

Table 4-5 Major Maintenance Cycle

Sr. No.	Year	Main Carriageway	Service Road
1	FY 2027 to FY 2028	-	-
2	FY 2029	Major maintenance with 30 mm BC with PMB (100%) + Milling & 50 mm DBM (6%)	Major Maintenance with 30 mm BC with VG-40 (50%) + Micro-surfacing (50%)
3	FY 2030 to FY 2035	-	-
4	FY 2036	Major maintenance with 30 mm BC with PMB (100%) + Milling & 50 mm DBM (5%)	Major Maintenance with 30 mm BC with VG-40 (50%) + Micro-surfacing (50%)
5	FY 2037 to FY 2042	-	-
6	FY 2043	Major maintenance with 30 mm BC with PMB (100%) + Milling & 50 mm DBM (5%)	Major Maintenance with 30 mm BC with VG-40 (50%) + Micro-surfacing (50%)
7	FY 2044 to FY 2046	-	-
8	FY 2047 to FY 2049	Assumption of Capacity Augmentation to Six Lane Configuration	
9	FY2050	-	-
10	FY 2051	End of Concession Period	

The projected cost for periodic / major maintenance is presented in the subsequent chapter.

5 COST ESTIMATES

5.1 General

Based on the assessment carried out in previous chapters, various costs were worked out. The costs are divided into following categories.

I. Balance Works Cost
II. Routine O&M Cost
III. Major Maintenance Cost
IV. Periodic Replacement of TMS / ATMS system

Costs for different category are detailed out in subsequent sections along with the assumptions considered for rate and escalation.

5.2 Rate Assumption

Following assumptions are considered for unit rates of various items while estimating the cost:

1. Unit rates of different items (BC, DBM, Concrete, Road markings etc.) are calculated as per the MoRTH Standard Data Book 2019. The input rates for MoRTH standard data book were adopted as below:

   a. **Manpower and Labour:** As per applicable minimum wages published by Ministry of Labour & Employment, Government of India.

   b. **Bitumen:** Concessionaire has long term contract with IOCL for the procurement of bitumen and related products. Same discounts are considered on bitumen procurement for this analysis. Furthermore, we also understand that bitumen prices are primarily dependent on crude oil price and market demand and hence are likely to be very volatile and difficult to predict at this stage.

      Therefore, bitumen prices are considered as per the forecast of Client. Current published of bitumen are considered for unit rates calculation for FY 2027. Average 10 years of price of bitumen are considered for unit rates calculation for FY 2028 and onwards, since bitumen prices have been range bound over the last five-six years. Following rates of bitumen are considered.

Table 5-1 Bitumen Rates - Ex-MI Supply excluding discount and GST

Supply Location	Applicability of Rates	Product	Current Published Price (FY 2027)	Long term price (Avg last 10 years)
Mathura	All States	VG-10	45,102	35,125
		VG-30	46,402	36,137
		VG-40	48,962	38,131
Panipat	All States	VG-10	45,102	35,125
		VG-30	46,402	36,137
		VG-40	48,962	38,131
Koyali	All States	VG-10	47,102	37,125
		VG-30	48,402	38,137
		VG-40	51,082	40,251
Haldia	All States	VG-10	46,602	35,683

Supply Location	Applicability of Rates	Product	Current Published Price (FY 2027)	Long term price (Avg last 10 years)
		VG-30	47,402	36,295
		VG-40	49,962	38,256
Barauni	All States	VG-10	47,132	36,213
		VG-30	48,432	37,325
		VG-40	50,992	39,286
CPCL	Kerala	VG-10	47,402	35,519
		VG-30	48,402	36,395
		VG-40	50,762	38,120
CPCL	Tamil Nadu	VG-10	47,902	36,019
		VG-30	48,402	36,395
		VG-40	50,962	38,320
CPCL	Telangana and Andhra Pradesh	VG-10	44,602	32,719
		VG-30	45,402	33,395
		VG-40	47,962	35,320
CPCL	Karnataka	VG-10	44,602	32,719
		VG-30	45,402	33,395
		VG-40	47,962	35,320

c. **Sand and Aggregate:** Rates are taken from Public works Department Tamilnadu SOR FY 2025-26.

d. **Cement:** Rates are taken from Public works Department Tamilnadu SOR FY 2025-26.

e. **Steel :** Rates are taken from Public works Department Tamilnadu SOR FY 2025-26.

f. **Machinery Hire charges:** Hire charges for the machinery are considered in accordance with applicable PWD SOR.

g. **Actual Rates of items as per work order:** The rates of road marking, road stud, kerb raising, micro surfacing, milling, median filling rates etc. are considered as per the work order shared by the client.

2. Goods and Service Tax (GST) is considered as 18% as per the latest Government Guidelines.

Summary of Unit Rates worked out using Standard Data Book adopted for major items is given below.

Table 5-2 Summary of Unit Rates

Sr. No.	Item Description	Unit	Rates (Rs.)
1	Dense Bituminous Macadam	Cum	9,217
2	Bituminous Concrete (VG40)	Cum	10,361
3	Bituminous Concrete (PMB)	Cum	12,205
4	Milling	Sqm	90
5	Micro-surfacing	Sqm	162

Sr. No.	Item Description	Unit	Rates (Rs.)
6	Kerb Re-laying	Rmt	330
7	Road Marking on BC surface	Sqm	573
8	Road Marking on micro surface	Sqm	713
9	Road Studs	Nos.	203

5.3 Balance Work Cost

As discussed in the previous chapter, the balance works cost for Project Road is **NIL**.

5.4 Routine O&M Cost

Routine O&M cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses, horticulture and ROW maintenance, routine maintenance and other miscellaneous expenses. The Concessionaire has provided the major agreements towards operation and maintenance for past years. Necessary assumptions have made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area. Same has been divided into following major heads.

1 Salary and Welfare Expenses
2 Tolling Operations Services
3 Toll Security Services
4 Incident Management & Emergency Services
5 Electricity and Diesel Charges
6 TMS / HTMS / System Expenses
7 Office Operating Expenses
8 Vehicle Running Expenses
9 Professional Fees Expense
10 Community Development
11 Communication Expenses
12 Conveyance Expenses
13 Insurance Expense
14 IE Fees
15 Routine Maintenance Cost (Project Road)
16 Horticulture & ROW Maintenance
17 Miscellaneous including Contingency

In above, the Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey. Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Operation and Maintenance cost (Routine O&M) is presented below. The detailed working of routine maintenance (Sr. No. 15 of below table) is presented in **Annexure-I**.

Table 5-3 Summary of Operation Cost

Sr. No.	Particulars	Amount (FY 2027 to FY 2050)	Amount (FY 2051)
1	Salary and Welfare Expenses	1,56,65,760	1,56,65,760
2	Tolling Operations Services	2,22,28,778	2,22,28,778
3	Toll Security Services	53,12,874	53,12,874
4	Incident Management & Emergency Services	1,91,15,165	1,91,15,165
5	Electricity and Diesel Charges	25,07,747	25,07,747
6	TMS / HTMS / System Expenses	49,76,982	55,07,640
7	Office Operating Expenses	13,52,244	13,52,244
8	Vehicle Running Expenses	27,60,000	27,60,000
9	Professional Fees Expense	71,89,624	1,05,24,646
10	Community Development	2,52,477	2,52,477
11	Communication Expenses	3,47,156	3,47,156
12	Conveyance Expenses	3,78,716	3,78,716
13	Insurance Expense	73,74,673	73,74,673
14	IE Fees	79,45,711	79,45,711
15	Routine Maintenance Cost (Project Road)	3,32,70,908	4,30,60,855
16	Horticulture & ROW Maintenance	2,13,01,100	2,13,01,100
17	Miscellaneous including Contingency	38,96,316	40,50,944
	Total Cost (Rs.)	**15,58,76,232**	**16,96,86,487**
	Total Cost (Cr.)	**15.59**	**16.97**
	Per km Cost (Lakhs)	24.55	26.72

5.5 Major Maintenance Cost

The summary of Major Maintenance Cost is provided as below. The detailed working of the same is presented in **Annexure-II**.

Table 5-4 Summary of Major Maintenance Cost

Sr. No.	Year	Major Maintenance Cost (Cr.)	Remarks
1	FY 2027 to FY 2028	-	
2	FY 2029	79.07	
3	FY 2030 to FY 2035	-	
4	FY 2036	87.30	
5	FY 2037 to FY 2042	-	
6	FY 2043	78.38	
7	FY 2044 to FY 2047	-	
8	FY 2048 to FY 2049	-	Capacity Augmentation in FY 2048 / FY 2049
9	FY 2050	-	
9	FY 2051	-	End of concession period
Total Cost (Cr.)		**244.75**	

5.6 Periodic Replacement of TMS / ATMS System

Every 7 years, replacement of cost of major TMS / ATMS system is considered. The same is provided as below.

Sr. No.	Year	HTMS O&M / Replacement Cost (Cr.)	Remarks
1	FY 2027	7.29	
2	FY 2034	7.29	
3	FY 2041	7.29	
4	FY 2048	7.29	
Total Cost (Cr.)		**29.16**	

5.7 Escalation Assumption

Following escalation has been considered for the O&M cost as provided by Client.

Table 5-5 Escalation

Year	Escalation	Year	Escalation
2025	-	**2041**	3.99%
2026	-	**2042**	3.99%
2027	5.25%	**2043**	3.99%
2028	4.86%	**2044**	3.99%
2029	4.44%	**2045**	3.99%
2030	4.24%	**2046**	3.99%
2031	4.13%	**2047**	3.99%
2032	4.08%	**2048**	3.99%
2033	4.01%	**2049**	3.99%
2034	4.00%	**2050**	3.99%
2035	4.03%	**2051**	3.99%
2036	4.01%	**2052**	3.99%
2037	3.98%	**2053**	3.99%
2038	3.98%	**2054**	3.99%
2039	4.00%	**2055**	3.99%
2040	3.99%	**2056**	3.99%

5.8 Summary of Cost

Different O&M cost have been worked out based on the investigations and assessment on Project Road. Cost for each of the category has already discussed in previous sections. Since the forecasting has been carried out for remaining concession period, the cost is summaries yearly for remaining concession period along with escalation as mentioned in clause 5.7.

Escalated O&M Cost (in INR Cr.)

Sr. No.	Year of expense	FY27	FY28	FY29	FY30	FY31	FY32	FY33	FY34	FY35	FY36	FY37	FY38	FY39	FY40	FY41	FY42	FY43	FY44	FY45	FY46	FY47	FY48	FY49	FY50	FY51

Ordinary Repairs

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity**
				More than 4500 CVD
				BT Surface
1	**2**	**3**	**4**	**5**
1	**Maintenance of Carriageway & Paved Shoulders (1.5m wide); B.T. Surface**			
	i) Potholes repair (50 mm deep)	100 % Pothole free	As & when required	1.00%
	Volume (cum)			5.00
	Rs/m^3			11446
	Cost in Rupees			57,230
	ii) Patch repair	100 % Patch less	As & when required	1.00%
	Area (sqm)			100
	Rs/m^2			458
	Cost in Rupees			45,784
	iii) Sealing (Crack)			
	a) Wider than 3 mm	100 % Crack Less	As & when required	1.50%
	Area (sqm)			150
	Rs/m^2			80
	Cost in Rupees			12,064
	b) Width less than 3 mm	75 % Crack Less	As & when required	2.50%
	Area (sqm)			187.5
	Rs/m^2			54
	Cost in Rupees			10,067
	iv) Repair of ruts and undulations			
	a) Greater than 20 mm	75%	As & when required	1.00%
	Area (sqm)			75
	Rs/m^2			458
	Cost in Rupees			34,338
	v) Road marking	14%	Once in 7th year &	14580

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity**
				More than 4500 CVD
				BT Surface
1	**2**	**3**	**4**	**5**
			@ Repaired location	
	SUB TOTAL			**1,74,063**
2	**Maintenance of earthen Shoulders:**			
	i) Renewal of earthen shoulders	80%	Once in a Year	6937
	ii) Jungle Clearance	100%	Twice in a Year	2276
	iii) Kuccha Drain Maintenance	100%	Twice in a Year	1219
	SUB TOTAL			**10,432**
3	**Maintenance of Cross Drainage works:**			
	i) Cleaning of culvert bed	100%	Once in a Year	3072
	ii) Repair of floors	100%	Once in a Year	5560
	iii) Repair of parapets	100%	As & when required	2317
	SUB TOTAL			**10,949**
4	**Maintenance of Minor & Major Bridges:**			
	i) Cleaning and removal of dirt & vegetation from pier caps, Bearings, Expansion Joints, Superstructure, Substructure and Retaining wall etc.	100%	As & when required	40,644
	ii) Spot painting & protective Coating required on Bearing and greasing of Bearings, railing, structural members, Expansion joints			
	iii) Repair of minor washouts, erosion scour and animal holes			
	iv) Sealing Cracks with Cement/ Epoxy Mortar			
	v) Replacement & Correction of safety barriers, Guard rails and damaged members			
	SUB TOTAL			**40,644**
5	**Miscellaneous Items:**			
	i) Turfing and Arboriculture		Once in a Year	2710

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year

1 INTRODUCTION

1.1 Background

Cube Highways Fund Advisors Pvt. Ltd. (hereinafter referred as "the Client") is the Investment Manager of the Cube Highways Trust ("Trust" or "InvIT"). The Trust is registered with Securities and Exchange Board of India ("SEBI") as an Infrastructure Investment Trust under the SEBI InVIT Regulations. Cube Highways Fund Advisors Pvt. Ltd. has appointed **M/s FP Project Management Consultancy Services Private Limited** (hereinafter referred as "Technical Consultant" or "FPPM") to carry out Technical Due Diligence of National Highway No. 47 including the section from Walayar to Vadakkancherry (km. 182+250 to km. 240+000 of NH-47) - Package NS-2/BOT/KL-2 - on DBFOT (Toll) basis under NHDP Phase-II in the State of Kerala (approx. 54.00 kms) (hereinafter referred as "Project Road").

Walayar Vadakkencherry Expressways Private Limited (WVEPL) (hereinafter referred as "Concessionaire") is a special purpose vehicle (SPV) for development, maintenance and management of National Highway No. 47 including the section from Walayar to Vadakkancherry on DBFOT (Toll) basis under NHDP Phase-II.

The Date of Concession Agreement is 17th September 2012. The concession period of the project is 20 years commencing from the Appointed Date including implementation period. The Appointed Date of the project is 18th May 2013. The Provisional Completion Certificate was issued on 18th May 2015 and the Commercial Operation commenced from 23rd May 2015. The Completion Certificate was issued on 31st October 2015 for total length of the project i.e. 53.495 kms.

Sr. No.	Description	Date
1	Date of Signing the Concession Agreement	17th Sep 2012
2	Appointed Date	18th May 2013
3	Scheduled Project Completion Date	13th Nov 2015
4	Scheduled End of Concession	17th May 2033
5	Date of issue of Provisional Completion Certificate	18th May 2015
6	Date of Commencement of Commercial Operation	23rd May 2015
7	Date of Issue of Completion Certificate	31st Oct 2015

Presently, the project is under operation and maintenance and the Technical Consultant has undertaken the work of assessment of operation and maintenance (O&M) cost based on site inspections and field investigations. The same is according to presented in this report.

1.2 Scope of Work

The detailed scope of work for conducting the technical due diligence of Project Road is presented as below:

- A reconnaissance of the Project Road to understand the current condition of the pavement, structures, road furniture, toll plaza and other highway assets
- Review and assessment of important technical documents like CA, pavement design report, O&M report, DPR, As-built drawings, O&M manual, COD / PCOD certificate, punch list, previous major maintenance etc.
- Review of recent pavement investigations and surveys conducted on Project Road like FWD, NSV, axle load, material investigations etc.

- Formulation of future major maintenance strategy
- Estimation of any initial expenses to be incurred due to deficiencies observed in diligence
- Estimation of Routine Maintenance and Major Maintenance forecast for remaining concession period
- Estimation of Annual Operation expenses along with Systems cost (TMS / HTMS) till the end of concession period

1.3 Our Approach Philosophy

1.3.1 Composition of Team

Our team consists of well-qualified engineers and other professionals, whose experience covers all the skills and specializations required for undertaking such assignments. All the team personnel proposed are our regular employees and have a long and stable working relationship with our firm.

The Team Leader coordinates the activities between all the key staff who work closely together. The key staff is assisted by various support staff, who report to the respective key staff in their field of expertise. The Team Leader is the point of contact for Client on Technical Study.

The technical study includes review of all the available documents namely:

a) Concession Agreement including Technical Schedules
b) O&M Contract, work order and their provisions
c) Quality of construction based on available data, design and drawings
d) Documents on historical expenditure on operation and maintenance
e) O&M cost schedule for the concession period
f) Review of Completion / Provisional Completion along with punch list items
g) Review of recent pavement surveys conducted
h) Correspondence regarding scope of works and during O&M
i) Recent O&M Report submitted to Authority
j) Toll operation manual / ATMS related documents

The review of above documents is the first step towards accomplishment of the task. This gives a complete idea of the project and is used as input data for preparation of report after necessary analysis.

1.3.2 Site Visit and Data Collection

A team of experts from various streams has carried out the preliminary site visit to understand the assessment of project assets, mainly condition of the pavement and structures.

- The site visit is undertaken for detailed reconnaissance and visual pavement condition assessment.
- The condition assessment of major structures by visual inspection
- The information like material sources and the probable cost is collected for the purpose of cost estimates.

The detailed design / drawings viz. Plan & L-sections, drainage design, structure design, layout drawings for project facilities like toll plaza, bus bay, truck lay-byes, highway lighting facilities etc. are studied. Also, design / drawing and provision pertaining to road furniture are studied.

The information on availability of material in the vicinity is gathered. It has direct impact on cost of maintenance work and balance work.

The basic approach for preparation of cost estimates for operation and maintenance is as per the practice of State PWD / MORT&H in respect of highways and structures.

1.3.3 Data Analysis

Based on the study of the available information and preliminary site visits, the consultants share their preliminary observations with the Client based on the evaluation of the technical data and reports provided by the Client.

1.4 Structure of the Report

This report has been prepared based on the information, reports and documents made available to us by the Client. We have also referred to publicly available reports, literature etc. and have made our best efforts to check the authenticity of the information available, analyses the same as per the best engineering / industry practices.

The site visit and inspection of the project site was carried out during the period from **04th March 2026 to 06th March 2026**.

The report is organized with the following chapters for easy understanding of various issues.

Chapter 1 **Introduction:** The chapter gives an overview of the project background, detailed scope of work, approach, and methodology for technical due diligence study.

Chapter 2 **Project Description:** The chapter describes existing project features, overview of project development etc.

Chapter 3 **Condition Assessment of Project Road:** The chapter presents the details and condition of various essential features of the Project Road based on the site visit.

Chapter 4 **Pavement Investigation and Assessment:** The chapter describes the summary of pavement surveys and investigations carried out on Project Road along with the requirement of pavement maintenance.

Chapter 5 **Cost Estimates:** The chapter summarizes the forecast for O&M and major maintenance costs over the remaining concession period.

2 PROJECT DESCRIPTION

2.1 Introduction

National Highways Authority of India signed the Concession Agreement with **Walayar Vadakkencherry Expressways Private Limited (WVEPL),** is a company promoted by Cube Highways or company a Special Purpose Vehicle (SPV) formed for implementing this project on 20th October 2020.

2.2 Location

The Site of the Four-Lane divided Project Road comprises the section of National Highway 47 commencing from km. 182.250 (Design Chainage km. 182.250) at Walayar to km. 240.000 (Design Chainage km. 236.135) (Approx Length is 53.495 kms) at Vadakancherry in the State of Kerala.

The Location Map of the Project Road is presented below:

Figure 2-1 Location Map

The photographs taken during the site visit are presented below.

Figure 2-2 Start of Project Road

Start of Project at km. 182+207 (LHS)

Start of Project at km. 182+207 (RHS)

Figure 2-3 End of Project Road

End of Project at km. 236+130 (LHS)

End of Project at km. 236+130 (RHS)

Lane marking in progress at End of Project at km. 236+130 (LHS)

2.3 Climate

The project location has a tropical wet and dry climate. Temperatures remain moderate throughout the year with the exception in March and April being the hottest months. A very high amount of precipitation is received in project area, mainly due to the South-West monsoon. July is the wettest month, and the total annual rainfall is around 83 inches (210 cm).

2.4 Terrain

The Project Road traverses through plain / rolling terrain.

2.5 Abutting Land Use

The Project Road passes through residential and agricultural zones.

2.6 Right of Way

The width of existing Right of Way (RoW) throughout the project stretch is 60.0 m, except Toll Plaza area.

2.7 Existing Utilities

During the widening of the Project Road, various affected utility services located along the project road were shifted out at the edge of the ROW. The different types of utilities found along the road include, electrical poles, telephone poles, hand pumps, permanent structures, temples etc.

2.8 Service Road

The total length of service road on both side is 49.338 kms.

2.9 Development as per Schedule-B

The Project Road from km. 182+250 (Design Chainage km. 182+250) at Walayar to km. 240+000 (Design Chainage km. 236+135) at Vadakancherry (Approx Length is 53.495 kms) has been developed as a four-lane paved carriageway 17.5 m wide excluding median. The Project Road passes through rural as well as built-up sections.

As per Article 2 of Concession Agreement, the scope of project defined in Schedule-A and Schedule-B, (the **"Scope of the Project"**) shall mean and include, during the Concession Period:

a) Construction of the project on the Site set forth in Schedule-A and as specified in Schedule-B together with provision of project facilities as specified in Schedule-C and in conformity with the Specification and Standards set forth in Schedule-D.
b) Tolling, operation, management, maintenance, and transfer of the Project Highway subject to and in accordance with the provisions of this Agreement.
c) performance and fulfilment of all other obligations of the Concessionaire in accordance with the provisions of the Concession Agreement and matters incidental thereto or necessary for the performance of any or all of the obligations of the Concessionaire under the Concession Agreement.

Following is the Scope of Work as per Schedule-B of Concession Agreement.

Table 2-1 Details of Scope of Work

Sr. No.	Particulars	Unit	Scope as per Schedule-B	Constructed as per site
1	O&M of Main Carriageway	km	53.885	53.495*
2	Rail Over Bridge (ROB)	Nos.	01	01
3	Grade Separator	Nos.	02	02
4	Major Bridge	Nos.	02	02
5	Minor Bridge	Nos.	17	17
6	Vehicular Underpass	Nos.	08	08
7	Culverts	Nos.	165	165

*Difference of about 0.39 km in the project length is due to the missing chainage. Hence, the total construction length is 53.495 kms.

3 CONDITION ASSESSMENT OF PROJECT ROAD

3.1 Pavement

The paved carriageway is 17.50 m wide excluding the median. The project is widened to a four lane-carriageway with a width of 17.50 m as per standard cross section including paved shoulders. Service Road of 7.0 m width has been provided on one side or both sides wherever required in the built-up area to cater for the local traffic.

The entire stretch of Project Road including service road is constructed with flexible pavement. The pavement type for the toll plaza including taper is of rigid pavement.

3.1.1 Pavement Condition Survey

Pavement condition survey was carried out from **04th March 2026 to 06th March 2026** through visual inspection for the entire project length. From the visual inspection, the pavement condition of the Project Road is found to be Good.

Some of the photographs taken during the site visit are presented as below:

Figure 3-1 Photographs of Pavement Condition (Main Carriageway)

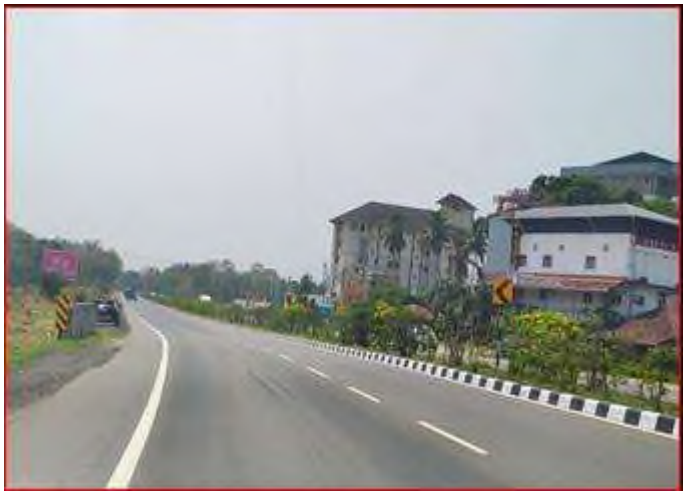
Pavement Condition at km. 184+850 (LHS)

Pavement Condition at km. 201+300 (LHS)

Pavement Condition at km. 214+250 (LHS)

Pavement Condition at km. 219+000 (RHS)

Pavement Condition at km. 222+200 (RHS)



Pavement Condition at km. 230+700 (LHS)

3.2 Service Road / Slip Road

The service road of width 7.0 is constructed in built-up area and adjoining underpass locations. The Project Road has total service road length of 49.338 kms. The condition of service roads at under construction VUP locations are poor and need to be repaired. After the completion of VUP construction, NHAI will repair the service road and hand it over to the Concessionaire for maintenance.

The photographs taken during the site visit are presented below:

Figure 3-2 Photographs of Service Road

Service Road at km. 184+850 (LHS)

Service Road at km. 113+600

Service Road at km. 223+360 LHS

Service Road at km. 222+000

3.3 Major / Minor Junctions

There are 09 nos. of major junctions and 36 nos. of minor junctions along the Project Road.

The photographs taken during site visit are presented as below:

Figure 3-3 Photographs of Major Junctions

Major Junction at km. 193+620

Major Junction at km. 196+000 (LHS)

Major Junction at km. 196+000

Major Junction at km. 203+000 (RHS)

Major Junction at km. 200+350

Figure 3-4 Photographs of Minor Junctions

Minor Junction at km. 218+920

Minor Junction at km. 220+400 (LHS)

Minor Junction at km. 231+850

Minor Junction at km. 213+100 (LHS)

3.4 Inventory and Condition Survey of Structures and Bridges

The inventory of structures including major bridges, minor bridges, ROB's, underpasses and culverts is presented in table as below:

Table 3-1 Details of Summary for Structures

Sr. No.	Type of Structure	Total Number of Structures as per Concession Agreement	Total Number of Structures as per site
1	Rail Over Bridge (ROB)	01	01
2	Grade Separator	02	02
3	Major Bridge	02	02
4	Minor Bridge	17	17
5	Vehicular Underpass	08	08
6	Culverts	165	165

All major structures and CD works were visually inspected. The structures are generally sufficient for storm water drainage. The waterway needs regular cleaning. All the old bridges are 2-lane and widened to 2 additional lanes. Old bridges have RCC railing. They are constructed in open foundation. Expansion joints in some of the bridges are observed to be damaged. Bearings of some of the bridges need to be re-inspected and repaired, if necessary. In case of some bridges, settlement in approaches and cracks in the pavement has been observed. New bridges are constructed in 2-lane with footpath keeping a provision of converting into 3-lane in future. Foundation is RCC pile foundation. The wearing course and expansion joints are found okay. Crash barriers are of RCC type and are in sound condition. Return wall are of RCC type and pitching has been provided in almost all bridges. ROB on Project Road is found in sound condition. Structures are of Box type and RCC type and are in sound condition. Expansion joints are in good condition. RE walls are provided for the approaches of the structure.

The detailed condition survey of ROB, major bridges, minor bridges, flyovers and culverts was carried out by visual inspection. The observations and findings are presented below.

3.4.1 Cross Drainage (Bridges and Culverts)

Slab culverts are visually inspected. Some culverts are old and widened. The old structures have been strengthened with repair and rehabilitation during widening. The widening is either concentric or eccentric. The quality of concrete of abutment, slab, and wing wall, or return wall, parapet wall is satisfactory except at some locations. Minor settlement on approach is observed at few culverts. The slope protection was done at a major location. The slopes are stable. Generally, all the slab culverts are found in sound condition. The waterway needs to be cleaned on both sides of the culverts. Box culverts are visually inspected. The RCC box culverts are retained and widened. The RCC quality of new box culverts is good. The structure number is painted on the parapet wall or crash barrier in most of the culverts. The waterway is clear in most of the culverts and needs to be cleared for a few culverts, particularly in urban areas.

Pipe culverts are visually inspected. The pipe culverts are either newly constructed or reconstructed, and the pipe culverts are retained and widened. The widening is either concentric or eccentric. In most of the culverts, the ends are blocked by debris, garbage or vegetation, or buried underground, especially in urban areas. Regular cleaning of the waterway is required to avoid damage to the pavement.

The following photographs were taken during the inspection of culverts.

Figure 3-5 Photographs of Culverts

Box culvert at km. 187+980 (LHS)

Box culvert at km. 114+750 (LHS)

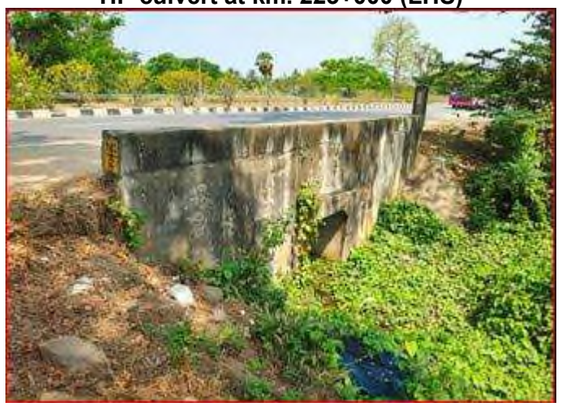
HP culvert at km. 223+370 (LHS)

HP culvert at km. 225+200 (LHS)

Box culvert at km. 221+250 (LHS)



Box culvert at km. 221+600 (LHS)

Box culvert at km. 218+950 (LHS)

3.4.2 Minor Bridges

Table 3-2 Details of New Minor Bridges

Sr. No.	Existing Chainage (km)	Design Chainage (km)	Proposed structural configuration	Proposed Structure type	Proposed span arrangement (m)	Total width of the structure (m)	TDD Consultant's Remarks
1	182+236	182+237	2 lane c/w with footpath	RCC Structure	3 x 9.15	12.00	RR masonry pier & Solid slab structure is on LHS. The pavement is in good condition. The new structure of RCC pier, abutment & T-beam girder is on RHS. Expansion joints, crash barriers, pavement is in Fair condition. Vegetation is noticed at LHS.
2	190+940	190+970	2 lane c/w with footpath	RCC Structure	1 x 16.50	12.00	The new structure is on LHS. The structure is in good condition. Condition of pavement, crash barrier, slope protection is in Fair condition. Minor vegetation is noticed on A1 RHS.
3	194+390	194+470	2 lane c/w with footpath	RCC Structure	1 x 22.00	12.00	The new structure is on RHS. The structure condition is good. The overall structure of the old bridge is in good condition. Cleaning and vegetation removal are necessary. Further, expansion joint and drainage spout cleaning is necessary.
4	201+l25	201+295	2 lane c/w with footpath	RCC Structure	1 x 11.20	12.00	Old structure is on LHS. The structure is in good condition. The new structure is on RHS. Both structures are in good condition.
5	204+539	204+680	2 lane c/w with footpath	RCC Structure	1 x 21.40	12.00	The new structure is on RHS. The structure condition is good. Vegetation and silt need to be removed. Cleaning of expansion joints is necessary for new structure.
6	209+350	209+950	2 lane c/w with footpath (Skew)	RCC Structure	2 x 13.00	12.00	The new structure is located on the right-hand side (RHS), and its condition is good. According to the NHAI proposal for the new construction of a Vehicular Underpass (VUP) at km. 209+900, the height of the minor bridge on both sides will be increased by another agency and the same work is completed.
7	212+568	213+160	2 lane c/w with footpath	RCC Structure	1 x 20.00	12.00	Single span structure with girders on both sides. Silt needs to be removed from the bed portion. Further, vegetation needs to be removed. Cleaning of expansion joint needs to be done
8	214+252	214+272	2 lane c/w with footpath	RCC Structure	1 x 13.50	12.00	RCC old structure is on LHS which is in good condition. Single span structure with girders, RCC pier and solid slab. The new structure is on RHS. The overall structure condition is good on both sides. Removal of heavy, thick vegetation and silt etc. on either side to be done and waterway to be cleared.
9	221+895	219+570	2 lane c/w with footpath	RCC Structure	1 x 9.00	12.00	RCC old structure is on RHS which is in good condition. The new structure is in good condition. Cleaning is required as there is presence of vegetation in the waterway of canal.
10	224+531	222+165	2 lane c/w with footpath (Skew)	RCC Structure	3 x 9.00	12.00	RCC old structure is on LHS which is in good condition. The new structure which is in LHS is in good condition. Rehabilitation is required as there is presence of vegetation and silt. Minor steel / Aggregate exposer noticed on P2 BHS Sub structure which needs to be rectified.
11	227+358	224+902	2 lane c/w with footpath	RCC Structure	3 x 16.40	12.00	RCC old structure is on RHS where concrete crash barrier is reconstructed. The new structure which is in LHS is in good condition. Rehabilitation is required in the form of cleaning of expansion joints, removal of vegetation in waterway etc.
12	239+030	235+180	2 lane c/w with footpath	RCC Structure	3 x 16.40	12.00	RCC Old structure is on RHS. The new structure which is in LHS is in good condition, but exposure of steel is observed on the side of deck slab which is repaired. Vegetation / silt removal is also required for both structures apart from rehabilitation. Minor settlement noticed at Approach road BHS.

Construction of New Cross Drainage Structures on Service Road at Minor Bridge Locations

Sr. No.	Existing Chainage (km)	Design Chainage (km)	Proposed structural configuration	Proposed Structure type	Proposed span arrangement (m)	Side (LHS / RHS)	Total width of the structure (m)	TDD Consultant's Remarks
1	194+390	194+470	2 lane c/w	RCC Structure	1 x 22.00	Both sides	8.50	The new structure is on RHS. The structure condition is good. Overall structure condition of old structure is good. Debris and vegetation removal are necessary.
2	212+568	213+160	2 lane c/w	Causeway	10 x 1.2m dia. HP	LHS	8.50	Single span structure. Silting and vegetation grown need to be removed from the bed portion. Cleaning of expansion joints is required.
3	212+568	213+160	2 lane c/w (Skew)	RCC box culvert	3 x 3.00	RHS	8.50	Single span structure. Debris and silt deposition need to be removed from the bed portion. Cleaning and repairing of expansion joint is required.
4	227+358	224+902	2 lane c/w	RCC Structure	3 x 16.40	Both sides	8.50	RCC structure (old) is on RHS where removal of thick vegetation and cleaning of expansion joint is required. On LHS (new structure), cleaning of expansion joint is required. Further, on both side removal of thick vegetation and desilting is necessary for waterway.

Sr. No.	Existing Chainage (km)	Design Chainage (km)	Proposed structural configuration	Proposed Structure type	Proposed span arrangement (m)	Side (LHS / RHS)	Total width of the structure (m)	TDD Consultant's Remarks
5	239+030	235+180	2 lane c/w	RCC Structure	3 x 16.40	RHS	8.50	RCC masonry pier and solid slab structure. Parapet wall rehabilitation work and wearing course overlaying is done. Honeycombing is observed on piers is repaired. Further, steel is exposed / came out at slab level. Pier foundation protection work is damaged. Hence, rehabilitation measures are required to be carried out to correct the deficiency / deterioration. Bearing replaced for Old Structure and drainage spouts found damaged. At A2 LHS approach slab repairing done.

The following photographs were taken during the inspection of Minor Bridges.

3.4.3 Major Bridge (length > 60 m)

There are 02 Nos. of Major Bridges on Project Road. Both Major Bridges were visually inspected. The structures are generally sufficient for the crossing of river water. The waterway needs regular cleaning. Old structures are present on the right side of both locations. All the old bridges are additional 2-lane lanes with footpaths. Old bridges have RCC railing. The sub-structures are constructed with RCC piers. Expansion joints on both the bridges need to be cleaned. Minor settlement in approaches and damage on pavement has been observed. New bridges are constructed in 2-lane with footpath. Old bridges on RHS have RCC pier and T-beam girders. The wearing course and expansion joints are found to be in good condition. W-beam and RCC type crash barriers are in sound condition. Drainage spouts and expansion joints need to be cleaned regularly. Further, vegetation and silt need to be removed from the waterway for smooth flow of water.

Table 3-3 Details of Major Bridges

Sr. No.	Design Chainage (km)	New Chainage (km)	Type of Structure	No. of Span	Span Arrangement (m)	No. of Lane with footpath	Side	Construction Scheme	TDD Consultant's Remarks
1	198+725	198+870	Major Bridge (Nagargampally River)	4	4 x 26.60	2	LHS	New Construction	The structure is in good condition. Pipe railing & Concrete crash barriers are in good condition.
				4	4 x 26.60	2	RHS	Old Construction	The structure is in fair condition. Apron Pitching needs to be repaired. Crash barriers are in sound condition. Rectification work of RHS is done with replacement of bearings.
2	207+260	207+900	Major Bridge (Yakkara River)	8	8x 21.40	2	LHS	New Construction	The structure is in good condition. Pipe railing and Concrete crash barriers are in good condition. Cleaning of Expansion joints is required.
				8	8x 21.40	2	RHS	Old Construction	The structure is in fair condition. In slope protection works vegetation needs to be clean. Drainage spouts cleaning is required. Bearings & Expansion joint replacement work is Completed as per IE requirement.

The following photographs were taken during the inspection of Major Bridges.

3.4.4 Underpasses

Table 3-4 Details of Vehicular Underpasses

Sr. No.	New Chainage (km)	Type of Structure	No. of Span	Span Width (m)	No. of Lane	Construction scheme	TDD Consultant's Remarks
1	197+730	VUP	1	17.50	4	New construction	The overall structure condition of all underpasses is found to be good. RCC crash barriers, W-beam crash barriers, slope protection work, wearing coat is found to be good. Minor settlement on approaches is noticed. In underpasses at km. 217+500 and km. 234+400 vegetation removal on RE wall portion and cleaning of drainage spout is required. At the old Vehicular Underpass at km. 209+076, a crack is observed on the slope protection. Vegetation removal on slab / crash barrier needs to be removed on old underpass Approach at A1 side. At LHS Median side Girder found some reinforcement exposed due to hitting of Vehicle needs to be rectified
2 (a)	209+076	VUP (L/S)	1	13.20	2	Old construction	
2 (b)	209+076	VUP (R/S)	1	13.20	2	New construction	
3	217+500	VUP	1	25.00	4	New construction	
4	234+400	VUP	1	17.50	4	New construction	
Note: The Concessionaire has constructed two underpasses under Change of scope apart from regular scope shown above. The structures are constructed at km. 202+760 and km. 206+310 (Skew).							

The following photographs were taken during the inspection of Underpasses:

VUP at km. 225+507 (bottom view)

3.4.7 ROB

There is 01 No. of ROB on Project Road at km. 208+975. A new structure is constructed on the right side and the existing structure is on the left side. Old structure is RCC box type. Steel reinforcement is exposed to the wing wall of old ROB. The steel railing of old ROB was found totally damaged. The new structure is constructed with RCC girder of single span. The structure is in good condition. Wearing coat is in good condition. The crash barrier for new structure is found to be in good condition.

Table 3-7 Details of ROB

Sr. No.	Design Chainage (km)	Type of Structure	Side	No. of Span	Span Width (m)	Length (m)	No. of Lane	Construction scheme	TDD Consultant's Remarks
1	208+375 / 208+975	ROB	LHS	1	10.50	6.50	2	Old construction	The pavement is in good condition. kerbs are re-cast. Hudge Vegetation is observed at slope protection area. Chute drains are not provided on embankment, as per the provision of CA. The Steel railing is totally damaged. So, all the lapses / defects mentioned above need to be attended.
			RHS	1	12.00	6.50	2	New construction	Overall, the structure is in good condition. The pavement & crash barrier condition is good. Vegetation noticed on RE Wall A1 RHS needs to be cleared.

The following photographs were taken during the inspection of ROB.

Figure 3-11 Photographs of ROB

Median View of ROB at km. 208+975

Abutment-2 and Girder of New ROB at km. 208+975

New ROB return wall & structure condition at km. 208+975 (RHS)

3.4.8 New Construction of VUP at Major Junction

The National Highways Authority of India (NHAI) has appointed a new agency for the construction of new Vehicle Underpass (VUP) with approaches at ten major junctions (Black spots) located at all Major Junctions. The work is in progress at km. 209+900, km. 215+750 and km. 226+700.

The following photographs were taken during the inspection.

Figure 3-12 Photographs of New VUP (under construction)

A1 Approach Road Work is in progress at km. 209+900 (LHS)

Work is in progress at km. 215+750

VUP Work is in progress at km. 226+700

3.5 Drainage

Drains are to be constructed at the Project Road to have good drainage. Lined drains are provided at the sides of the service road and at some locations covered lined drains are provided at the separators between the main carriageway and service road. Median cut drains are provided at superelevation locations. The drainage condition of Project Road is in order. Silt deposits need to be removed during routine maintenance. Total 11.2 kms of covered / open line side drain is found on site. The condition of the same is good to fair.

Some of the photographs taken during the site visit are presented below.

Figure 3-13 Photographs of Drainage

Earthen Drain at km. 231+400 (RHS)

Drain at Median km. 233+550 (RHS)

Drain at km 233+500 (RHS)

Earthen Drain at km. 229+850 (LHS)

3.6 Slope Protection

Slope protection is found on Project Road at certain locations. At a few locations, the slope protection is damaged, which needs to be rectified by the Concessionaire.

Some of the photographs taken during the site visit are presented below.

Figure 3-14 Photographs of Slope Protection

Slope Protection at km. 194+410

Slope Protection at km. 208+450 (RHS)

Slope protection at km. 224+700 (LHS)

Slope protection at km. 208+450

3.7 Road Furniture

3.7.1 Pavement Marking

The design and marking for the Project Road are done as per the design standards as indicated in Schedule-D and the location for various treatments are drafted in consultation with the Independent Engineer.

Some of the photographs taken during the site visit are presented below.

Pavement Marking at km. 213+050

Pavement Marking at km. 230+700 (LHS)

3.7.2 Traffic Signage

Traffic signs include roadside signs, overhead signs, curb mounted signs and road marking along the Project Road. The design for the Project Road is done as per the design standard indicated in Schedule-D.

The height, lateral clearance, location and installation are as per relevant clauses of Schedule 'D'. Overhead signs shall be installed ahead of major intersections, toll plazas and urban areas as per detailed design requirements.

3.7.3 Highway Lighting

Highway Lighting is provided in urban and semi-urban areas of the Project Road. Lighting is provided at the locations of truck lay-bye, rest areas, toll plazas, underpasses, ROBs, service road stretches and at intersections / interchanges. IS:1944 (Part I and Part II) is followed for lighting installations. High mast lighting systems are provided at major junctions, locations of ROB / Flyover / Underpass / Grade Separator.

Some of the photographs taken during the site visit are presented below.

Highway Lighting at km. 213+100 (Median)

Highway Lighting at km. 222+400 (BHS)

3.7.4 Road Studs / Cat's eyes

The Concessionaire has provided road studs / cat's eyes as per Schedule-D on the curves, road junctions, zebra crossings, in municipal area and village settlement and ramps etc. to provide the proper visibility to the road users. All the road studs / cat's eyes on the Project Road are replaced.

Some of the photographs taken during the site visit are presented below.

Road Studs at km. 218+930 (Junction)

3.7.5 Pedestrian Guard Rail

The pedestrian guard rails are provided between main carriageway and service road at built-up locations. Damaged / missing pedestrian guard rails are replaced or repaired.

3.7.6 Avenue Plantation and Median Plantation

Avenue Plantation is available intermittently along the Project Road. However, the same requires regular maintenance. Median Plantation too needs proper regular maintenance.

Trees were planted in ROW and on either side of the road with staggered pitch as per IRC:SP:21. At present, replantation is in progress wherever required on Project Road. Arrangements for plantation of trees is in accordance with the MORT&H Technical Circle No. NH-41 (34) / 69. A spacing of 10 m - 15 m c/c is recommended for spacing of trees parallel to the roads. Set back distance of trees needed in different situations is as per the IRC:SP:21 and IRC:66. Shrubs in median is normally exceed 1 m - 1.5 m heights and as per IRC:SP:21. The landscaping is carried out as per the extent policy of NHAI as is being done on NHAI's public funded projects.

Some of the photographs taken during the site visit are presented below.

Median Plantation at km. 198+800

Avenue Plantation at km. 214+550 (RHS)

3.7.7 Traffic Signage / Median kerb painting / KM Stone

Traffic signs include roadside signs, overhead signs, kerb mounted signs and median signs along the Project Road. The design for the traffic signs along the Project Road is done as per the design standards indicated in section 11 of Schedule-D.

The height, lateral clearance, location and installation are as per relevant clauses of Schedule 'D'. Overhead sign has been installed ahead of major intersections, toll plazas, start / end of Project Road and urban areas as per detailed design requirements.

Kilometre stones, vertical post of sign boards, chevron boards and median kerb paint are faded at few locations which will be rectified by the Concessionaire.

Some of the photographs of sign boards are presented below.

3.7.8 Crash Barriers

Metal beam crash barriers are provided at bridge approaches, locations of high embankment and sharp curves. All the crash barriers provided by the Concessionaire are maintained at site.

Some of the photographs of metal beam crash barriers are presented below.

Figure 3-16 Photographs of MBCB / Crash Barrier

MBCB at km. 201+350 (LHS)

Crash barrier at km. 222+400 (LHS)

3.7.9 Delineators

The traffic delineators are provided by the Concessionaire on the Project Road for road users. The same are maintained by the Concessionaire.

Some of the photographs of delineators are presented below.

Figure 3-17 Photographs of Delineators

Delineator at km. 219+000 (Median)

Delineator at km. 198+800

3.7.10 Chain link fencing

The chain link fencing is provided at the Major Junction Palakkad. It is maintained by the Concessionaire.

Some of the photographs of chain link fencing are presented below.

Figure 3-18 Photographs of Chain link fencing

Chain link fencing at km. 203+950 RHS Major Junction Palakkad

3.8 Toll Plaza

As per the Concession Agreement, there is one toll plaza on the Project Road at km. 189+400. The details of the Toll Plaza are as follows.

Table 3-8 Details of Summary for Toll Plaza Items

Sr. No.	Particulars	Details		Remarks
		LHS	RHS	
1	Number of Tolling Lanes	5	5	
2	Weigh in Motion Facility (Number of Lanes)	5	5	
3	No. of ETC lanes	5	5	
4	No of Toll booths	9 Singles		
5	Canopy	Present		
6	Administrative building	Present		
7	Parking cum Toilet block	Present		Toilet block available
8	Availability of Tunnel or Elevated walkaway for movement between Toll lanes and administrative building	Tunnel / Yes		
9	Availability of static weigh bridge	Yes		2 numbers
10	Availability of Loading/Unloading Facility for Overloading vehicles	No		
11	Storage facility for Overloaded material	No		
12	High mast light	Yes		
13	Streetlight	Yes		
14	Low mast light	No		
15	User fee boards	Yes		
16	Cantilever/Gantry boards	Yes		
17	Automatic boom barrier	Yes		

Figure 3-19 Photographs of Toll Plaza

Medical Facility at Toll Plaza

3.9 Lane Equipment

Following are the lane hardware and equipment installed at toll plaza.

1. RFID ETC Transceiver
2. Lane Controller with Industrial PC
3. AVC Sensors

4. Automatic Lane Barrier (ALB)
5. Lane Traffic Light and user fare display
6. Incident Capture Camera
7. Overhead Lane Signals
8. Traffic Lights
9. Toll Booth Equipment

3.9.1 RFID ETC Transceiver

RFID ETC Transceiver reads tags installed on the windshield of vehicles and mounted on a pole at about 6 m height. Handheld RFID readers are provided (1 no. in each direction) in case a tag is not detected by the fixed reader.

RFID at Toll Plaza

3.9.2 Lane Controller with Industrial PC

Toll Lane Controller is located within the Electronic Enclosure placed inside each toll booth which are connected to the common server and are capable of independent storage of data.

Lane Controller in Tunnel at TP

3.9.3 Automatic Vehicle Classification (AVC) Sensors

The AVC equipment comprises of a pair of height sensor poles, axle sensors and inductive loops. The height detector has a high sensing resolution and detects height when object blocks the path. The presence of vehicle is detected by inductive loop. The loop sensors embedded on the pavement trigger the AVC height sensors located on parallel pillars.

AVC at Toll Plaza

3.9.4 Automatic Lane Barrier

Boom barriers installed on all lanes are in working condition and have a working time of 0.6 - 0.9 s. Automatic Lane Barrier is used to allow only authorized vehicles to pass through the lane. The barrier is activated only on generation of user fee receipt or other relevant vehicle processing activity. A torque motor powers the barrier for raising and lowering the boom. The motor can be blocked at any position without causing any damage. In the event of power failure, the boom is automatically raised. The boom weight is exactly balanced by built-in springs.

ALB at Toll Plaza

3.9.5 Lane Traffic Light (LTL) and User Fare Display (UFD)

Lane Traffic Light (LTL) is used to instruct vehicles to stop or pass through the lane. The LTL is RED when the toll collector is expecting the vehicle at the booth. After the transaction is done; the LTL turns Green to instruct the vehicle to pass through the lane. The User Fare Display is a part of electronic toll collection equipment located at the toll booth. It is a mini variable message sign (VMS) made of Light Emitting Diodes (LED). The user fare display is used to display the toll fare that is due and that must be paid by the motorist and the classification of vehicle selected by the collector.

LTL & UFD at Toll Plaza

3.9.6 Over Head Lane Signal (OHLS)

The **Overhead Lane Signal (OHLS)** for lane “Open” and “Close” sign consists of a pair of “GREEN” (arrow) and “RED” (cross) lights. The OHLS is located at the vehicle approaching side of the canopy to show the drivers whether the lane is open or closed.

OHLS at Toll Plaza

3.9.7 Toll Booth Equipment

Toll Booth Hardware / Equipment provided are:

- Toll Collector Display (Operator Monitor)
- Customized Industrial Keyboard
- Receipt Printer

- Intercom Slave unit
- Bar code reader
- Violation Light and alarm
- Manual Booth Control (MBC)
- Booth Camera

The operator monitor termed as Toll Collector Display (TCD) is located on the toll collector's desk. It is the system's interface to the toll collector, to display the status of transactions and status of the lane peripherals.

The keyboard on the toll terminal is a programmable keyboard for Registration of toll operations and is customized for different vehicle types and type of ticket.

Toll Booth equipment's at Toll Plaza

Thermal printers are installed at the toll booths to print tickets. Intercom slave unit facilitates communication with the master unit located in the control room.
Violation system has an alarm switch which is triggered whenever there is a violation such as run-through happening on the lane. When there is an emergency, a foot switch pressed by the booth operator alerts the control room.

Booth Cameras are provided on the inside roof corner of the booth to provide surveillance through CCTV screen located in the control room. Manual Booth Controller is used to release exempt vehicles.

3.9.8 Medium Speed Weigh in Motion (MSWIM)

Medium Speed Weigh in Motion (MSWIM) is installed on entry lanes of Toll Plaza.

MSWIM at Toll Plaza

3.10 Plaza Equipment

3.10.1 TMS Server & UPS Server for Central LAN 20kv

Plaza Server is provided in a hot standby configuration and provided with port non-POE network switch and Port PoE switch. Internet connectivity is available through one lease line (Airtel) and Jio Wi-Fi module. Firewall with Sophos antivirus is provided.

UPS Central for LAN 20kv & TMS Server at Toll Plaza

3.10.2 55" LED screen for CCTV monitoring

55" LED screen for CCTV monitoring installed at the toll plaza admin block provides view of all the toll booths, important zones within the plaza where cash transactions take place (server room, control room, cash up).

The toll plaza manager can observe the activities at the toll lanes and toll booth. When the toll collector calls up on the intercom, the manager can comprehend the situation at the lane by a zoomed view of the particular lane.

3.10.3 Workstations in POS room

Workstations are available in control room (lane monitoring, administration, and audit), and POS.

Point of sale room at Toll Plaza

3.11 Toilet Block

There is one toilet block provided at Toll Plaza. A photograph of the toilet block is presented below.

Photographs of Toilet Block

3.12 Bus Bays and Passenger Shelters

There are 43 Nos. of bus bays / passenger shelter along Project Road. Some of the photographs of the bus bays are presented below.

Figure 3-20 Photographs of Bus Bays / Passenger Shelter

Bus bay at km. 187+950 (LHS)

Bus bay at km. 213+020 (LHS)

3.13 Balance Work Status

The project has received Completion Certificate on 31st October 2015 by completing all the works as mentioned in the Technical Schedules of Concession Agreement. Hence, there are no balance works to be executed as per CA.

3.14 Operation and Maintenances

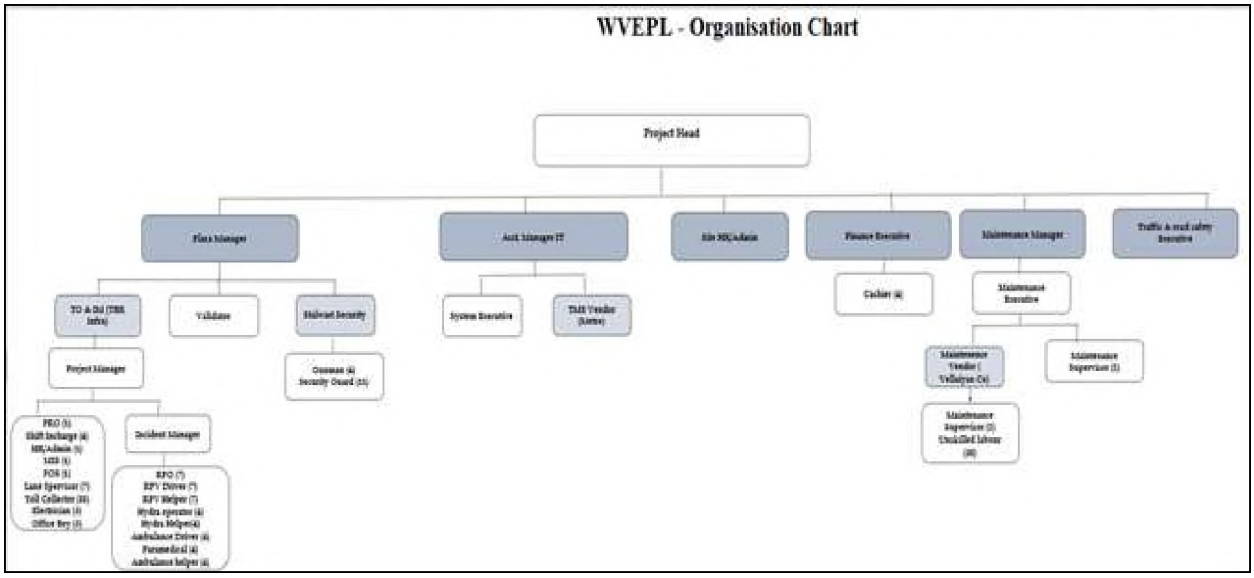
3.14.1 O&M Contract

As per Clause 15.1 of the Concession Agreement, the Concessionaire shall operate and maintain the Project Road by itself, or through O&M Contractors and if required, modify, repair, improve the Project Road to comply with Specifications and Standards, and other requirements set forth in the Agreement through Good Industry Practice, Applicable Laws and Applicable Permits and manufacturer's guidelines and instructions with respect to toll systems. The Operation and Maintenance activities shall conform to all the requirements laid down in MoRT&H, IRC Specifications and the Concession Agreement.

The Concessionaire has outsourced for carrying out the activities related to operation and maintenance of the Project Road including toll operation services, security services, AMC for TMC and AMC for DG set.

3.14.2 Organization Chart

The Concessionaire has given the Organization Chart at site for Operation and maintenance. Accordingly, there is 01 Project Head, 01 Senior Executive (F&A), 01 Senior Executive (HR), 01 Assistant Manager (TMS / IT), 01 Executive (TMS / IT), 01 Maintenance Manager, 01 Store Executive, 03 Supervisor, 02 Electrician, 01 Plaza Manager, 01 Document Controller, 04 Cashiers and 03 validators to carry out O&M activities. The team controls the maintenance activities. However, the maintenance work is undertaken and executed through competent sub-contractors.



3.14.3 Operation

Operation cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses and other miscellaneous expenses. The Concessionaire has provided the expenses occurred towards operation expenses for past years. Necessary assumptions have made from the expenses of similar types of projects to arrive at the operation cost. The estimates are projected based on the best industry practices and are compared with the operating cost in the vicinity of the project area.

The Operation Cost is presented in the subsequent chapter.

3.14.4 Routine Maintenance

The Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey.

Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Maintenance Cost is presented in the subsequent chapter.

4 PAVEMENT INVESTIGATION AND ASSESSMENT

4.1 General

Presently, the pavement of the Project Road is being maintained by the Concessionaire as per Scope of Work. The Concessionaire has received Completion Certificate on 31st October 2015 for the complete Project stretch.

The project is currently under the Operation and Maintenance stage. The concession period of the project is 20 years from the Appointed Date 18th May 2013 including construction period of 2.5 years.

4.2 Surveys and Investigation

4.2.1 Pavement Condition Survey

Pavement condition survey was carried out by the Technical Consultant from **04th March 2026 to 06th March 2026** through visual inspection for the project road and for the entire length.

The summary of pavement condition based on the visual inspection is tabulated below.

Table 4-1 Summary of Pavement Condition

Sr. No.	Chainage (km)		Length (km)	Visual Condition (As per IRC:115-2014)	
	From	To		Left Carriageway	Right Carriageway
1	182.207	236.130	53.495	Good*	Good

Observation and Conclusion:

From the above table, it is observed that the overall pavement condition for the entire project stretch is found to be Good.

*As compared to the RHS carriageway, the LHS MCW shows a higher extent of patchwork at certain locations, including crack sealing, milling, and relaying of bituminous concrete (BC).

4.2.2 Axle Load Survey

The Concessionaire conducted the Axle Load Survey on Project Road at km. 189+600 (near Toll Plaza) on 19th January 2021 and 20th January 2021. The summary of Vehicle Damage Factor (VDF) calculated as provided by the Concessionaire is tabulated below.

Table 4-2 Vehicle Damage Factor

Vehicle Category	Vehicle Damage Factor at km. 189+600 (near Toll Plaza)	
	Walayar - Vadakkancherry	Vadakkancherry - Walayar
Bus	0.856	0.759
LCV	2.000	0.470
2A	3.856	1.503
3A	9.218	2.419
MAV	17.073	6.082

4.2.3 Design Traffic

Traffic in Million Standard Axles (MSA) for the homogeneous section based on the historical traffic data provided by the Concessionaire, current traffic has been used for future projections and the estimated design MSA is computed and presented in subsequent table.

For the estimation of design MSA, Actual Traffic Growth Rates as provided by the Concessionaire were used.

Table 4-3 MSA Calculation

Year	LHS		RHS		Remarks
	MSA	Cumulative MSA (Walayar - Vadakkancherry)	MSA	Cumulative MSA (Vadakkancherry - Walayar)	
FY 2027	9.05	**9.05**	3.18	**3.18**	
FY 2028	9.77	**18.82**	3.44	**6.62**	
FY 2029	10.53	**29.35**	3.71	**10.33**	
FY 2030	11.03	**40.38**	3.89	**14.22**	
FY 2031	11.55	**51.93**	4.07	**18.29**	
FY 2032	11.87	**63.80**	4.19	**22.48**	
FY 2033	12.23	**76.03**	4.32	**26.80**	
FY 2034	12.83	**88.86**	4.53	**31.33**	End of concession period as per appointed date & CA
FY 2035	13.45	**102.31**	4.75	**36.08**	
FY 2036	14.10	**116.41**	4.99	**41.07**	
FY 2037	14.78	**131.19**	5.23	**46.30**	
FY 2038	15.49	**146.68**	5.48	**51.78**	End of concession period as per target revenue

4.2.4 Network Survey Vehicles (NSV) Survey

The Concessionaire conducted a pavement condition survey on each lane of each carriageway using NSV. The NSV survey was carried out on the Project Road from **05th March 2026 to 06th March 2026.**

Roughness Survey

Roughness Survey results were provided by the Concessionaire for analysis and to assess the riding quality on each direction (each lane) of the carriageway of Project Road.

The side-wise results of Roughness Survey are presented as below.

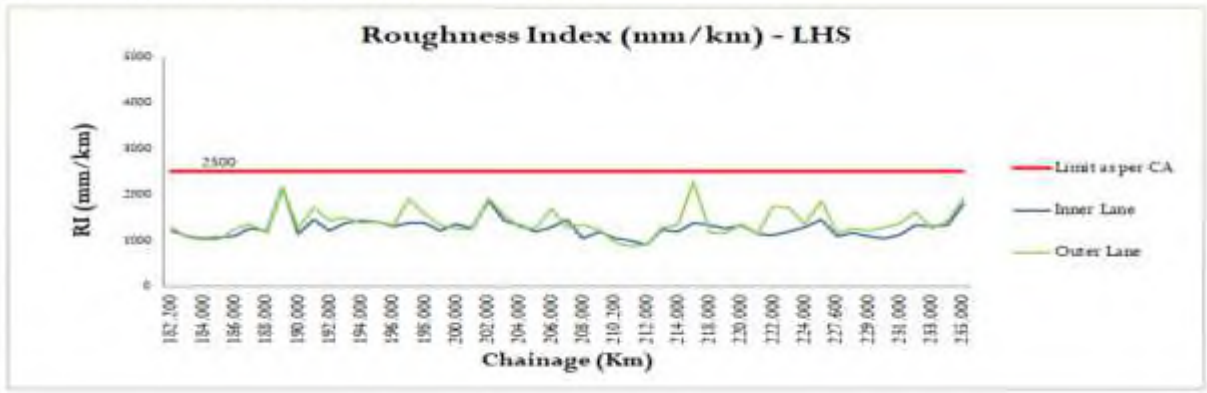
Table 4-4 Result of Roughness Survey

Table 2-1: Summary of RI Limit as per Schedule K of CA

Roughness Summary % as per Schedule K of CA (mm/km)					
Condition	Limit as per Schedule K of CA (mm/km)	LHS		RHS	
		Inner Lane	Outer Lane	Inner Lane	Outer Lane
Good	<2500	100.00%	100.00%	100.00%	100.00%
Poor	>2500	0.00%	0.00%	0.00%	0.00%

Roughness Index - LHS

Figure 2-3: Roughness Summary for WVEPL as per Schedule K of CA



Roughness Index - RHS

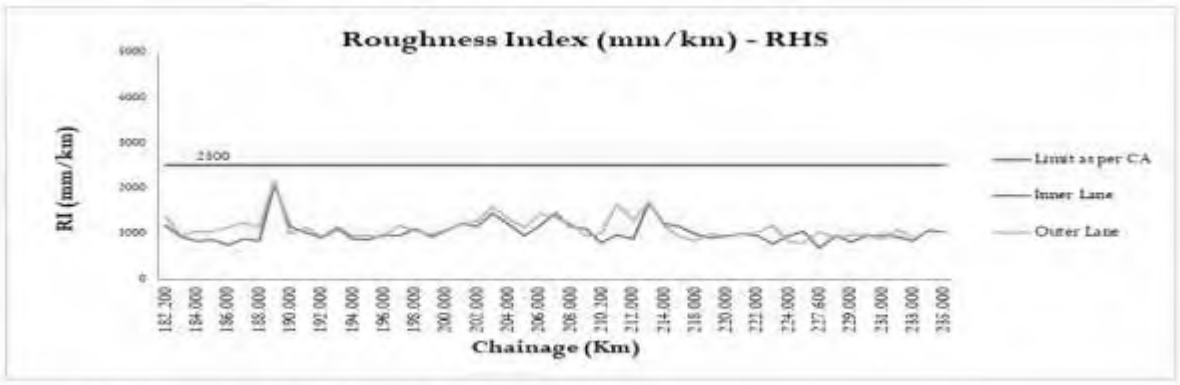


Figure 2-4: Roughness Index for WVEPL as per Schedule K of CA

Observation and Conclusion:

From the table of roughness survey result, it is observed that the overall pavement condition for the entire project stretch is found to be Good.

4.2.5 Structural Investigations

The structural evaluation and analysis of the remaining life of project was carried out in conformity with IRC:115-2014 “Guidelines for Structural Evaluation and Strengthening of Flexible Road Pavements Using Falling Weight Deflectometer (FWD) Technique”.

The FWD survey was conducted on the Project Road from **07th January 2026 to 09th January 2026**. The summary of the same is presented below.

Remaining Life of pavement on LHS

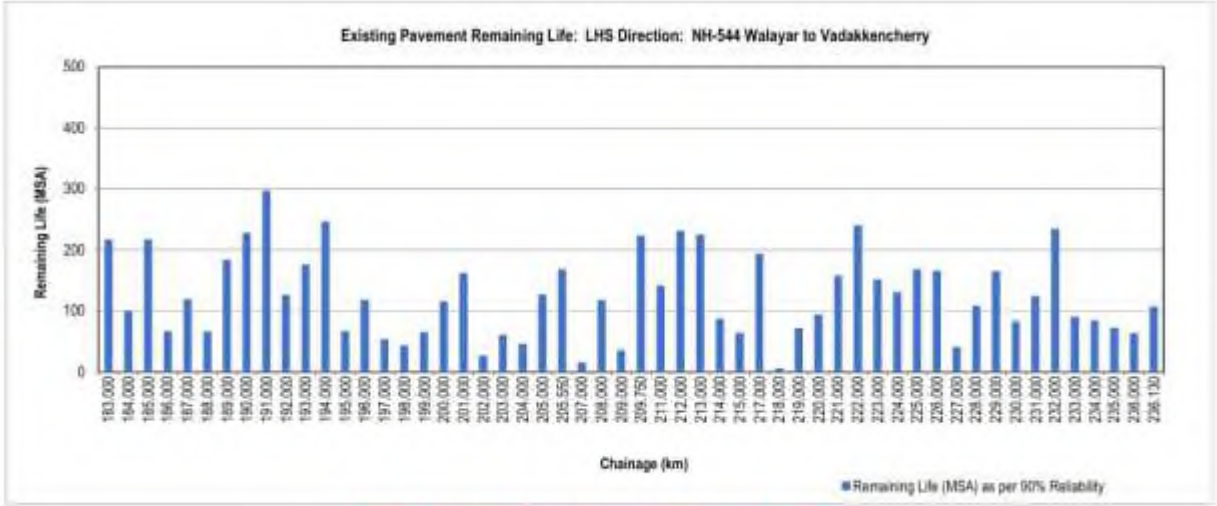

Figure 1-4: Remaining life of existing pavement on LHS Direction

Remaining Life of pavement on RHS

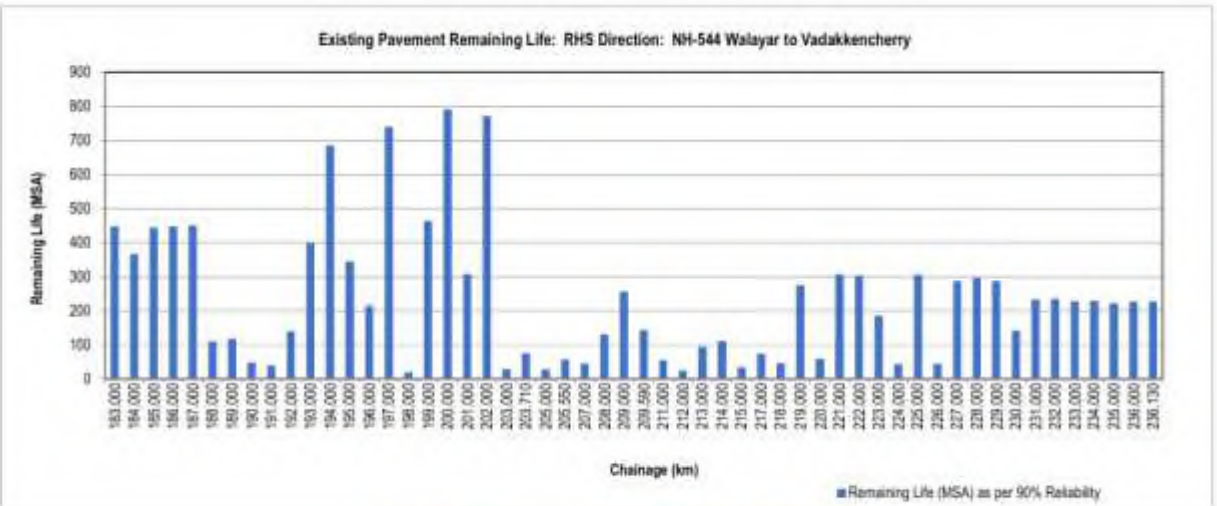

Figure 1-5: Remaining life of existing pavement on RHS Direction

However, the maintenance can be carried out on as and when required basis and to the compliance of Schedule-K requirement to maintain the road in serviceable condition. However, improvement in Riding Quality is expected if the roughness value exceeds 2500 mm/km.

4.2.6 Test pit and Subgrade Investigation

The Concessionaire carried out the subgrade investigation for the Project Road in February 2021. The results of the same as provided by the Concessionaire are tabulated below.

Table 4-5 Test Results Summary of Natural Ground Soil Samples

S. No.	Existing Chinage (Km.)	Side (LHS/RHS)	Soil Classification as per IS: 1498	Gradation: Percent by weight passing through the Sieve (IS:2720-IV)		Clay & silt content %	Atterberg Limits [IS :2720-Pt-V]			Modified Proctor Test (IS:2720-Pt-VIII)		In-situ Density		4-Days Soaked CBR (%)	Free Swell Index	Degree of Compaction (%)
				19.0 mm	4.75 mm		Liquid Limit (LL) %	Plastic Limit (PL) %	Plasticity Index (PI)	Max. dry density gm/cc.	OMC (%)	FDD (gm/cc)	FMC (%)			
1	182+500	LHS	SM	100.0	70.3	13.5	23	NP	NP	2.11	8.4	1.94	2.0	17.9	0.0	91.9

4.2.7 Periodic Maintenance Strategy

The Concessionaire has completed an overlay on both sides of project MCW throughout the entire project length and in Service Road, BC Overlay of 30 mm / 40 mm has been provided on both sides at distress locations in FY 2023.

The maintenance can be carried out as and when required basis and to the compliance of Schedule-K requirement to maintain the road in serviceable condition. Only improvement in the Riding Quality is to be made if the roughness value exceeds 2500 mm/km.

The table below shows the major / periodic maintenance cycle throughout the concession period for the Project Road.

Table 4-6 Major Maintenance Cycle

Sr. No.	Year	Main Carriageway	Service Road
1	FY 2023	Overlay completed for Project Length	Overlay completed at distress locations
2	FY 2024 to FY 2028	-	-
3	FY 2029	Major Maintenance with 30 mm BC (75%) and 40 mm BC (25%) + Milling & 50 mm DBM (11%)	Major Maintenance with 30 mm BC (50%) + Micro-surfacing (50%)
4	FY 2030 to FY 2035	-	-
5	FY 2036	Major Maintenance with 30 mm BC (100%)	Major Maintenance with 30 mm BC (50%) + Micro-surfacing (50%)
6	FY 2037	-	-
7	FY 2038	End of concession period as per traffic study	

**Actual end of concession period as per Concession Agreement is May 2033. However, as per traffic details submitted by the Concessionaire, the revised concession period is up to FY 2038 as per provision of Article 14 of CA.*

The projected cost for periodic / major maintenance is presented in the subsequent chapter.

5 COST ESTIMATES

5.1 General

Based on the assessment carried out in previous chapters, various costs were worked out. The costs are divided into following categories.

I. Balance Work Cost
II. Routine O&M Cost
III. Major Maintenance Cost
IV. Periodic Replacement of TMS / ATMS system

Costs for different category are detailed out in subsequent sections along with the assumptions considered for rate and escalation.

5.2 Rate Assumption

Following assumptions are considered for unit rates of various items while estimating the cost:

1. Unit rates of different items (Tack Coat, BC, DBM etc.) are calculated as per the PRICE (kerala.gov.in).

   a. **Manpower and Labour:** As per applicable minimum wages published by Ministry of Labour & Employment, Government of India.

   b. **Bitumen:** Concessionaire has long term contract with IOCL for the procurement of bitumen and related products. Same discounts are considered on bitumen procurement for this analysis. Furthermore, we also understand that bitumen prices are primarily dependent on crude oil price and market demand and hence are likely to be very volatile and difficult to predict at this stage.

      Therefore, bitumen prices are considered as per the forecast of Client. Current published of bitumen are considered for unit rates calculation for FY 2027. Average 10 years of price of bitumen are considered for unit rates calculation for FY 2028 and onwards. Following rates of bitumen are considered.

Table 5-1 Bitumen Rates - Ex-MI Supply excluding discount and GST

Sr. No.	Supply Location	Applicability of Rates	Product	Rate for FY 2027 (Rs. / MT)	Rate for FY 2028 onwards (Rs. / MT)
1	Mathura,	All States	VG-10	45,102	35,125
2			VG-30	46,402	36,137
3			VG-40	48,962	38,131
4	Panipat	All States	VG-10	45,102	35,125
5			VG-30	46,402	36,137
6			VG-40	48,962	38,131
7	Koyali	All States	VG-10	47,102	37,125
8			VG-30	48,402	38,137
9			VG-40	51,082	40,251
10	Haldia	All States	VG-10	46,602	35,683
11			VG-30	47,402	36,295
12			VG-40	49,962	38,256

Sr. No.	Supply Location	Applicability of Rates	Product	Rate for FY 2027 (Rs. / MT)	Rate for FY 2028 onwards (Rs. / MT)
13	Barauni	All States	VG-10	47,132	36,213
14			VG-30	48,432	37,325
15			VG-40	50,992	39,286
16	CPCL	Kerala	VG-10	47,402	35,519
17			VG-30	48,402	36,395
18			VG-40	50,762	38,120
19	CPCL	Tamil Nadu	VG-10	47,902	36,019
20			VG-30	48,402	36,395
21			VG-40	50,962	38,320
22	CPCL	Telangana and Andhra Pradesh	VG-10	44,602	32,719
23			VG-30	45,402	33,395
24			VG-40	47,962	35,320
25	CPCL	Karnataka	VG-10	44,602	32,719
26			VG-30	45,402	33,395
27			VG-40	47,962	35,320

c. **Sand and Aggregate:** Market rates are considered from the quarry located nearest to Project Road.

d. **Cement:** Market rates are considered from the nearest local market.

e. **Steel :** Rate of steel is taken from local market.

f. **Machinery Hire charges:** Hire charges for the machinery are considered in accordance with applicable PRICE (kerala.gov.in).

g. **Rates of items as per Work Order:** The rates of road marking, kerb raising, micro-surfacing, milling, road stud etc. are considered as per the Work Order issued to Contractor at Site shared by the client.

2. Goods and Service Tax (GST) is considered as 18% as per the latest Government Guidelines.

Summary of Unit Rates worked out using Standard Data Book adopted for major items is given below.

Table 5-2 Summary of Unit Rates

Sr. No.	Item Description	Unit	Rates (Rs.)
1	Dense Bituminous Macadam	Cum	9,733
2	Bituminous Concrete	Cum	10,932
3	Milling	Sqm	93
4	Micro-surfacing	Sqm	167
5	Kerb raising	Rm	268
6	Road Marking	Sqm	486
7	Road Studs	Nos.	193

5.3 Balance Work Cost

As discussed in the previous chapter, there are no balance works to be executed as per CA. Hence, the balance work cost is **NIL**.

5.4 Routine O&M Cost

Routine O&M cost is comprised of manpower cost, toll operation cost, power and electricity cost, office operating expenses, vehicle running expenses, administrative expenses, horticulture and ROW maintenance, routine maintenance and other miscellaneous expenses. The Concessionaire has provided the major agreements towards operation and maintenance for past years. Necessary assumptions have been made from the expenses of similar type of projects to arrive at the operation cost. The estimates are projected based on best industry practices and are compared with the operating cost in the vicinity of the project area. Same has been divided into following major heads.

1. Salary and Welfare Expenses
2. Tolling Operations Services
3. Toll Security Services
4. Incident Management Services
5. Electricity and Diesel Charges
6. TMS / HTMS / System Expenses
7. Office Operating Expenses
8. Vehicle Running Expenses
9. Professional Fees Expense
10. Community Development
11. Communication Expenses
12. Conveyance Expenses
13. Insurance Expense
14. IE Fees
15. Horticulture & ROW Maintenance
16. Routine Maintenance Cost

In above, the Routine Maintenance cost is derived based on the Ministry of Road Transport and Highways - Report of the Committee on Norms for Maintenance of Roads in India (published by Indian Road Congress New Delhi 2001) along with actual pavement condition assessed during condition survey. Maintenance cost constitutes the routine, day-to-day maintenance activities for project assets, including road pavement, shoulders, embankment, drainage, structures, plantations, roadside furniture, traffic signs, traffic safety devices etc. Past data has been used to assess maintenance costs due to normal usage or “wear-and-tear”. Likely costs of maintenance of structures are assessed based on their present condition and vintage, in combination with well-established guidelines and thumb rules given in Indian codes and standards.

The Routine Operation Cost is presented as below. The detailed working of routine maintenance (Sr. No. 15 of below table) is presented in **Annexure-I**.

Table 5-3 Summary of Operation Cost

Sr. No.	Particulars	Amount (FY 2027-38)
1	Salary and Welfare Expenses	1,22,82,000
2	Tolling Operations Services	2,43,09,078
3	Toll Security Services	49,90,395
4	Incident Management & Emergency Services	2,67,38,684
5	Electricity and Diesel Charges	87,30,539
6	TMS / HTMS / System Expenses	40,11,513
7	Office Operating Expenses	32,73,999
8	Vehicle Running Expenses	62,99,700
9	Professional Fees Expense	1,50,94,897
10	Community Development	14,36,848
11	Communication Expenses	3,64,514
12	Conveyance Expenses	3,97,651
13	Insurance Expense	1,48,34,137
14	IE Fees	1,30,00,790
15	Routine Maintenance Cost (Project Road)	2,42,00,758
16	Horticulture & ROW Maintenance	1,76,83,585
17	Miscellaneous including Contingency	54,30,590
	Total Cost (Rs)	**18,30,79,678**
	Total Cost (Cr)	**18.31**
	Per km Cost (Lakh)	**34.22**

5.5 Major Maintenance Cost

As informed by the Concessionaire, overlay has been completed in FY 2023 as a part of major maintenance. The Concessionaire has completed overlay of 40 mm BC (100%) on LHS and 30 mm BC (100%) on RHS. The pavement is also treated with 50 mm DBM on RHS at distressed section. As per the NSV test report conducted at site on 29th December 2023, MCW is in good condition and same has been verified during site visit.

The summary of Major Maintenance Cost is provided as below. The detailed working of the same is presented in **Annexure-II**.

Sr. No.	Year	Major Maintenance Cost (Cr.)	Remarks
1	FY 2024 to FY 2028	-	
2	FY 2029	67.71	
3	FY 2030 to FY 2035	-	
4	FY 2036	65.34	
5	FY 2037 to FY 2038	-	
Total Cost (Cr.)		**133.05**	

5.6 Periodic Replacement of TMS / ATMS System

Every 7 years, replacement cost of major TMS / ATMS system is considered. The same is provided as below.

Sr. No.	Year	HTMS O&M / Replacement Cost (Cr.)	Remarks
1	FY 2027	0.64	
2	FY 2034	0.64	
Total Cost (Cr.)		**1.28**	

5.7 Escalation Assumption

Following escalation has been considered for the O&M cost as provided by Client.

Table 5-4 Escalation

Year	Escalation	Year	Escalation
2028	4.86%	**2041**	3.99%
2029	4.44%	**2042**	3.99%
2030	4.24%	**2043**	3.99%
2031	4.13%	**2044**	3.99%
2032	4.08%	**2045**	3.99%
2033	4.01%	**2046**	3.99%
2034	4.00%	**2047**	3.99%
2035	4.03%	**2048**	3.99%

5.8 Summary of Cost

Different O&M cost have been worked out based on the investigations and assessment on Project Road. Cost for each of the category has already discussed in previous sections. Since the forecasting has been carried out for remaining concession period, the cost is summarised yearly for remaining concession period along with escalation as mentioned in Clause 5.7.

Escalated O&M Cost (in INR Cr.)

	Year of expense	FY 27	FY 28	FY 29	FY 30	FY 31	FY 32	FY 33	FY 34	FY 35	FY 36	FY 37	FY 38
1	Routine O&M Cost												
1.01	Salary and Welfare Expense	1.23	1.29	1.35	1.40	1.46	1.52	1.58	1.64	1.71	1.78	1.85	0.32

Ordinary Repairs

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity**
				More than 4500 CVD
				BT Surface
1	**2**	**3**	**4**	**5**
1	**Maintenance of Carriageway & Paved Shoulders (1.5m wide); B.T. Surface**			
	i) Pot holes repair (50 mm deep)	100 % Pot hole free	As & when required	0.50%
	Volume (cum)			2.50
	Rs/m^3			12744
	Cost in Rupees			31,860
	ii) Patch repair	100 % Patch less	As & when required	0.50%
	Area (sqm)			50
	Rs/m^2			510
	Cost in Rupees			25,488
	iii) Sealing (Crack)			
	a) Wider than 3 mm	100 % Crack Less	As & when required	2.50%
	Area (sqm)			250
	Rs/m^2			91
	Cost in Rupees			22,715
	b) Width less than 3 mm	75 % Crack Less	As & when required	2.00%
	Area (sqm)			150
	Rs/m^2			67
	Cost in Rupees			10,089
	iv) Repair of ruts and undulations			
	a) Greater than 20 mm	75%	As & when required	1.00%
	Area (sqm)			75
	Rs/m^2			510
	Cost in Rupees			38,232
	v) Road marking	14%	Once in 7th year & @	12902

Details of Ordinary Repair in Rs. For one km. of Two lane (7.0 m) of NH / SH per Year				
(Refer Annex. XXIV-E of REPORT OF THE COMMITTEE ON NORMS FOR MAINTENANCE OF ROADS IN INDIA, Page 112-113)				
Sr. No.	**Activity**	**Performance Standard Level of Maintenance**	**Frequency**	**Cost Per Km. as per Traffic Intensity**
				More than 4500 CVD
				BT Surface
1	**2**	**3**	**4**	**5**
			Repaired location	
	SUB TOTAL			**1,41,286**
2	**Maintenance of earthen Shoulders:**			
	i) Renewal of earthen shoulders	80%	Once in a Year	6306
	ii) Kuccha Drain Maintenance	100%	Twice in a Year	1108
	SUB TOTAL			**7,414**
3	**Maintenance of Cross Drainage works:**			
	i) Repair of floors	100%	Once in a Year	5055
	ii) Repair of parapets	100%	As & when required	2106
	SUB TOTAL			**7,161**
4	**Maintenance of Minor & Major Bridges:**			
	i) Spot painting & protective Coating required on Bearing and greasing of Bearings, railing, structural members, Expansion joints	100%	As & when required	36,950
	ii) Repair of minor washouts, erosion scour and animal holes			
	iii) Sealing Cracks with Cement/ Epoxy Mortar			
	iv) Replacement & Correction of safety barriers, Guard rails and damaged members			
	SUB TOTAL			**36,950**
5	**Miscellaneous Items:**			
	i) Lettering, Painting of Km stones & kerbs, sign boards, hectometer stone etc.		Once in a Year	3695
	ii) Replacement and providing additional retro reflective signage	20%	Covering Total Network in 4-5 Years	7390
	iii) Providing first aid kits, Umbrella, Safety Jackets, Vardi etc.		Once in a Year	1232
	iv) Traffic Census		Once in a Year	0
	v) Provision for roughness measurement		Twice in a Year	0

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through February 2026. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

Glossary Items

Acronym	Meaning
2A/ Truck	2 Axle/ Truck
3A	3 Axle
AADT	Annual Average Daily Traffic
BOT	Build Operate Transfer
CAGR	Compound Annual Growth Rate
CJV	Cars / Jeeps / Vans
COD	Commercial Operations Date
DPR	Detailed Project Report
ETC	Electronic Toll Collection, also referred to as FASTag
FY	Financial Year
GDP	Gross Domestic Product
GSDP	Gross State Domestic Product
HAM	Hybrid Annuity Model
HCM/ EME	Heavy Commercial Vehicles/ Earth Moving Machinery
IE reports	Independent Engineers' reports
IHMCL	Indian Highway Management Company Limited
INR	Indian Rupees
InvIT	Infrastructure Investment Trust

LMV	Light motor vehicles
MADT	Monthly average daily traffic
MAV	Multi Axle Vehicle
NH	National Highway
NHAI	National Highways Authority of India
NSDP	National State Domestic Production
OD	Origin Destination
OSV	Oversized vehicles
PCU	Passenger Car Unit; it is a measure of standard vehicle unit to convert all vehicle classes to a single unit by using PCU factors to compute total traffic on an asset.
Q1	Quarter 1 of financial year, from April to June
Q2	Quarter 2 of financial year, from July to September
Q3	Quarter 3 of financial year, from October to December
Q4	Quarter 4 of financial year, from January to March
RNP	Registered Number Plate
SCF	Seasonality Correction Factor

Acronym	Meaning
SH	State Highway
T&R	Traffic and Revenue
TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Delhi Agra Tollways Limited (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 11 project". It presents an update of the Asset's traffic and revenue forecasts over its remaining concession period based on actual traffic data available through February 2026 and latest macroeconomic, and network-related assumptions.

1.2 Our scope of work for the traffic and revenue forecasting process is presented in Table 1-1 below:

Table 1-1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Origin-Destination (OD) data, Vendor reports and documents	• Provided by Client for the period between FY16 and Mar '26, with FY26 base AADT and forecasts considering data up to Feb'26
• Historical analysis and forecasts for baseline growth, including – Background growth, – Seasonality	• Historical toll plaza data provided by Client and benchmarks from Assets in the vicinity wherever long time series historical data was not available
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue.
• OD analysis to understand growth drivers: – Zonal influence and Top OD pairs – Commodity distribution – Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer in 2026
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis based on Generalised Journey Cost spreadsheet-based analysis

Scope of work	Data source
• Historical revenue analysis and forecasts for revenue estimation, including – Toll segmentation and trip factors, – Overloading shares,	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor • Gross Domestic Product (GDP) forecast assumptions provided by Client
• Toll revenue estimation for the entire concession including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI) and latest actual Wholesale Price Index (WPI) trends as shared by the Client. • Assumptions of WPI forecasts and future tolling length changes provided by Client • Revenues estimated as a product of traffic forecasts and toll evolution

Our approach

1.3 The approach adopted by Steer for the preparation of these forecasts was designed to leverage existing understanding of the Asset, together with data provided by the Client and information obtained from publicly available sources. The methodology follows well-established industry practices for forecasting traffic growth on an existing (brownfield) asset. The analysis focused on two key areas of consideration, namely

- Understanding the traffic that is currently using the Asset; and
- Identifying how and why that traffic is likely to change in the future.

1.4 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data for KM46 and KM94 available from Jul'22 to Feb'26. The historical traffic and revenue presented in Chapter 3 considers information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.
  - TMS data for KM164 from FY13 to Feb '26
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous T&R studies and reports.
  - Bid and Lender studies.

  - Steer-commissioned OD survey at two plazas on the Asset: TP1 Gadpuri (KM46) and TP3 Mahuvan (KM164) to validate any change in growth drivers and travel patterns. Surveys were conducted at TP1 and TP3 on 25th and 27th February 2026 respectively.
  - Steer-commissioned TVC surveys from 25th – 27th Feb on TP1 and 26th to 28th February 2026 on both TP1 and TP3.
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plazas and subsequently matching it to the modelled revenue for FY26YTD using the prevailing toll rates and reported segmentation/toll-frequencies for FY26YTD. This is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plazas.

1.5 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against 11 months of actual traffic (Apr-Feb) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by Client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the remaining concession period. The analysis here includes the specific impacts of network-related developments, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case, and upside and downside scenarios.

Contents of this report

1.6 The report has been divided into the following chapters:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence.

- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits.
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC, and OD analysis.
- Chapter 4 presents the socio-economic context of India, the corridor and region/state containing the Asset, along with our approach and results on estimating background growth, and our key forecasting assumptions.
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth.
- Chapter 6 summarises our assessment of network-related impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for the upside and downside scenarios.

2 The Asset

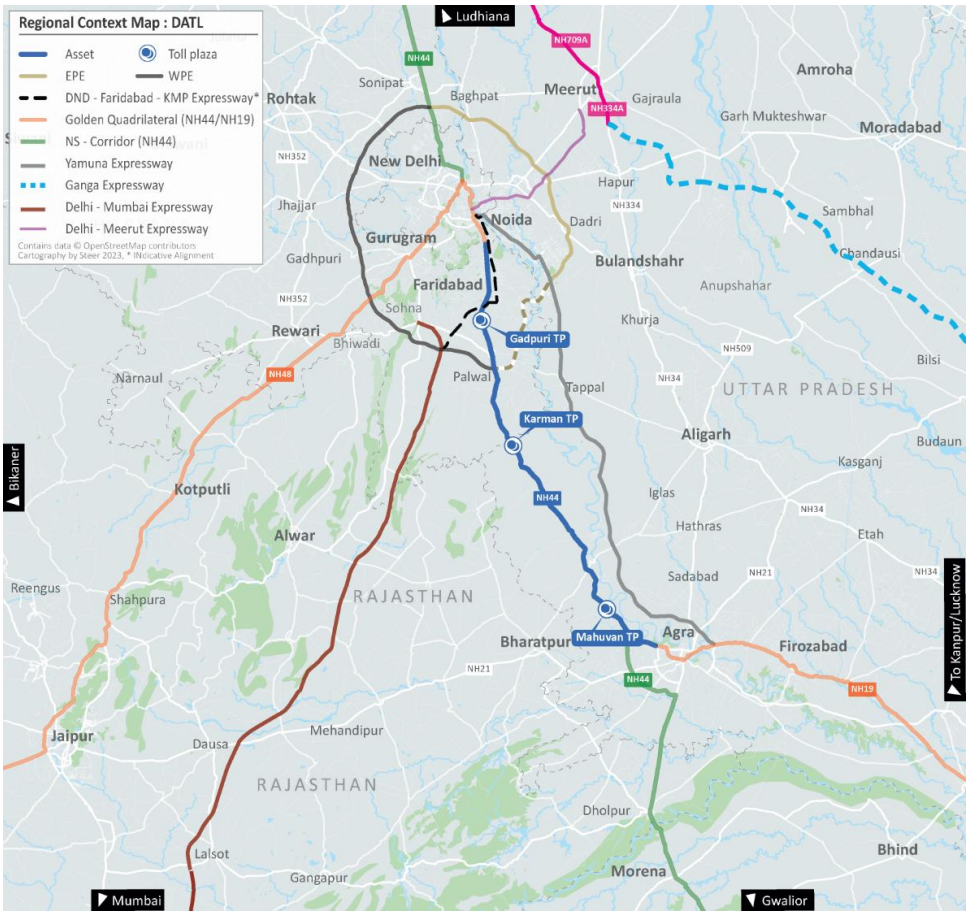
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the Asset's strategic network context, followed by key economic activities and network-related developments around the Asset.

Strategic Network Context

2.2 The Asset is situated in the states of Haryana (HR) and Uttar Pradesh (UP), connecting the Central National Capital Region (NCR; comprising Delhi) to Agra in the south, via Palwal (HR) and Mathura (UP). Figure 2.1 below presents the regional road network within which the Asset is located.

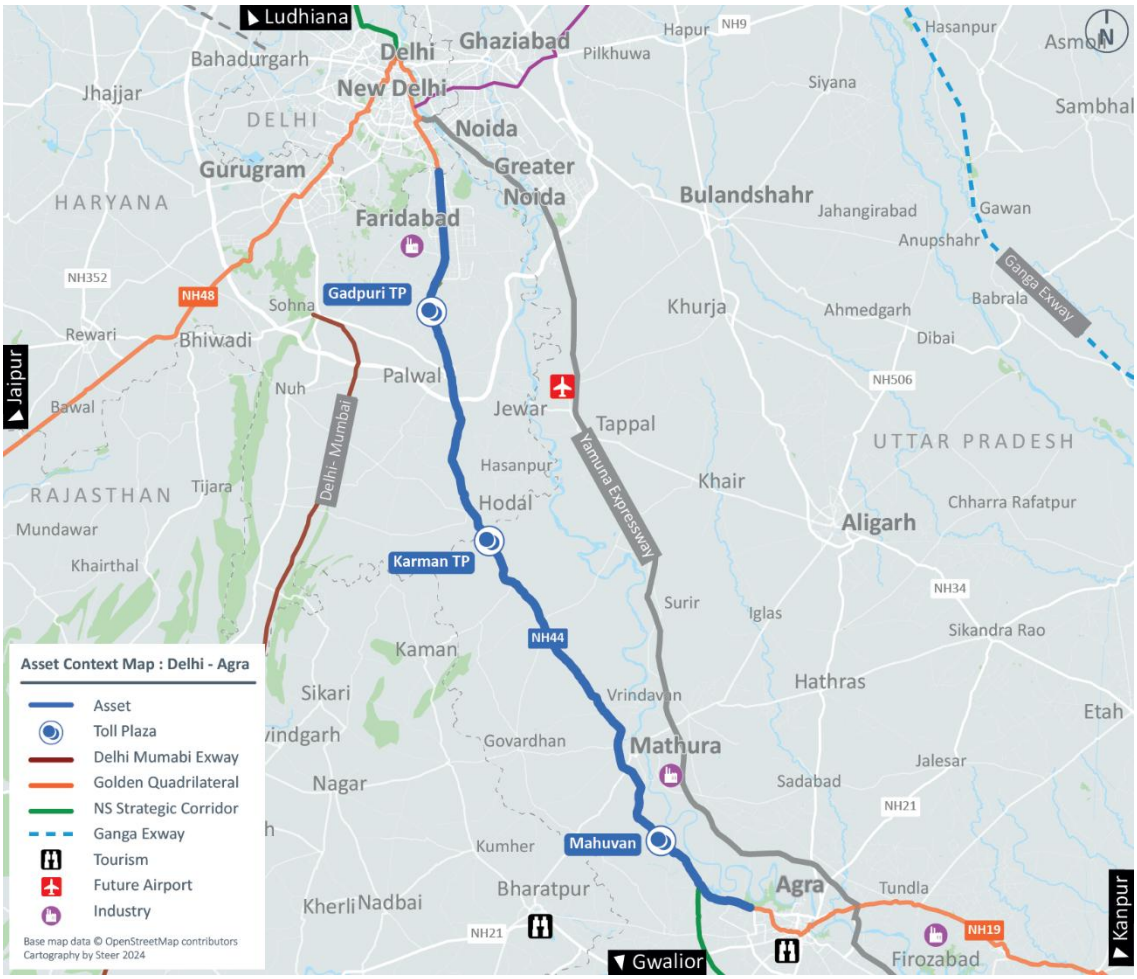
Figure 2.1: Regional Context



Source: Steer cartography using OpenStreetMap data

2.3 The Asset is a 179.5 km toll road between Delhi and Agra which forms part of the north-south NH44 corridor (Old NH2 in Haryana, and Uttar Pradesh). Previously, up to June 2022, the Asset operated two toll plazas i.e., Srinagar (KM74) and Mahuvan (KM164). On commencing full commercial operations (COD) from July 2022 onwards, the Asset began operating three toll plazas; Srinagar toll plaza (KM74) was split into two different toll plazas - Gadpuri (KM46), and Karman (KM94), which are now operational along with the existing plaza Mahuvan (KM164).

Figure 2.2: Asset context



Source: Steer cartography

2.4 The Asset forms part of the Grand Trunk Road – which is a part of the Asian Highway 1 (AH1). By virtue of its strategic location, it primarily caters to the following types of movements:

- **East-west long-distance movement** from Kashmir in North India to the India-Bangladesh border. This route originally connected Kabul in Afghanistan to Chittagong in Bangladesh. This movement caters traffic between northern parts of country and eastern states.
- **North-south long-distance movement** connecting Srinagar in Kashmir (northernmost state) to Kanyakumari in Tamil Nadu (southernmost state in mainland India). This movement caters traffic between northern parts of country (Delhi, Punjab) to the southern states of Karnataka, Telangana, etc.

- **Medium-distance movement** as a key corridor in this region, connecting Delhi with Lucknow, Kanpur, Indore etc. via Agra and Mathura.
- **Short-distance inter-urban movement** between towns and cities in and around Delhi, Palwal, Mathura and Agra.

Concession and tolling

2.5 The toll plazas on the Asset have been operational since December 2012, and the Client started the operations in FY20. There are still 13 years left in the concession period with FY39 being the last year of the concession. Table 2-1 below presents a summary of the concession.

Table 2-1: Summary of concession

Particulars	Details
State	Delhi, Haryana, Uttar Pradesh
Highway and lane configuration	• NH 19/NH 44 • Six-lane divided
Toll plazas	**Previously:** • KM74, Srinagar (till June 2022) • KM164, Mahuvan **Existing/Operational (July 2022 onwards):** • KM46, Gadpuri • KM94, Karman • KM196, Mahuvan
Length (KM) as per concession agreement, applicable	**Previously:** • KM74: 89.75 KM • KM164: 89.75 KM **Existing/Operational:** • KM46: 47.28 KM • KM94: 63.22 KM • KM164: 69.00 KM
Commencement of operations*	• KM46: July 2022 • KM94: July 2022 • KM164: December 2012
Operation by Client	FY20
Concession period	19 years
Last year of concession	FY39

Source: Concession agreement

2.6 Tolls are collected for toll categories including Single, Return, Local Commercial and Monthly Passes. Rates for Single Journey tickets on all three toll plazas are shown in Table 2-2 below.

2.7 All three toll plazas have dedicated ETC/FASTag lanes for electronic tolling. FY26 toll rates were revised in the start of FY26 fiscal year i.e., April 1, 2025.

Table 2-2: Vehicle-wise single toll rates on the Asset – applicable April 2025 to March 2026

Type of Vehicle	Single Journey Fee (INR)		
	KM46 – Gadpuri	KM94 - Karman	KM164 - Mahuvan
CJV	125	95	105
LCV	195	155	170
Bus/Truck	400	325	355
3A/MAV	615	510	555
HCM/EME/OSV	780	620	675

2.8 Figure 2.3 below illustrates a typical cross-section of the Asset and its associated toll plazas. Specifically, Pictures 1 and 2 depict the Gadpuri and Mahuvan toll plazas, while Pictures 3 and 4 showcase a cross-section and the quality of the Asset's road infrastructure.

Figure 2.3 (clockwise): Typical cross-section of the Asset and toll plaza

Source: Steer site visit

Key economic activities

2.9 The Asset connects the National Capital Territory (NCT) of Delhi at its northern end with the world-renowned tourist city of Agra at its southern end. Besides linking Agra to the national capital region, it also forms the initial section of a longer corridor that connects

Delhi and other parts of North India to Central, East and South India. As a result, the Asset observes significant volumes of all types of traffic, including, but not limited to:

- In terms of passenger movement, daily commuters travelling between Delhi and other smaller municipalities along the corridor (e.g., Palwal, Hodal, Mathura, Agra), and leisure travellers/tourists travelling to/from Agra and Delhi.
- In terms of commercial/goods movements, industry supplies and manufactured goods, as well as agricultural products, with a considerable share of consumption-based commodities.

Tourism

2.10 The Asset is surrounded by several major tourist attractions, with Delhi and Agra forming two of the three vertices of the Golden Triangle - one of India's most popular travel circuits for international tourists.[1] Delhi, Agra, Fatehpur Sikri and other towns in the region are home to several historical monuments and heritage sites, including the famed Taj Mahal (Agra). Religious tourism and pilgrimage sites include Surajkund, Badkhal Lake, Shivling at Hodal, ISKCON temple (all in and around Central NCR), and Banke Bihari and other major temples of Mathura and Vrindavan.

Industry

2.11 Major industrial and commercial centres are located at the northern end of the Asset, between Okhla, Badarpur, Faridabad[2], Ballabhgarh and Palwal[3], which are connected via the DND – KMP Expressway and the Asset. This includes North India's largest inland port and container transhipment terminal at Badarpur called ICD Tughlakabad[4]

2.12 Extending further south and east beyond the Asset, the Agra-Lucknow highway has historically been (and continues to be) an industrial corridor with leather and textile industries located in Agra[5] and Kanpur[6], and glassmaking industries located in Firozabad.

2.13 Mathura has an Indian Oil Corporation (IOCL) refinery with a capacity of 8.0 mmtpa[7]. Consequently, the Asset has a distinct industrial character, with a large share of traffic movements being good vehicles serving many of these industries.

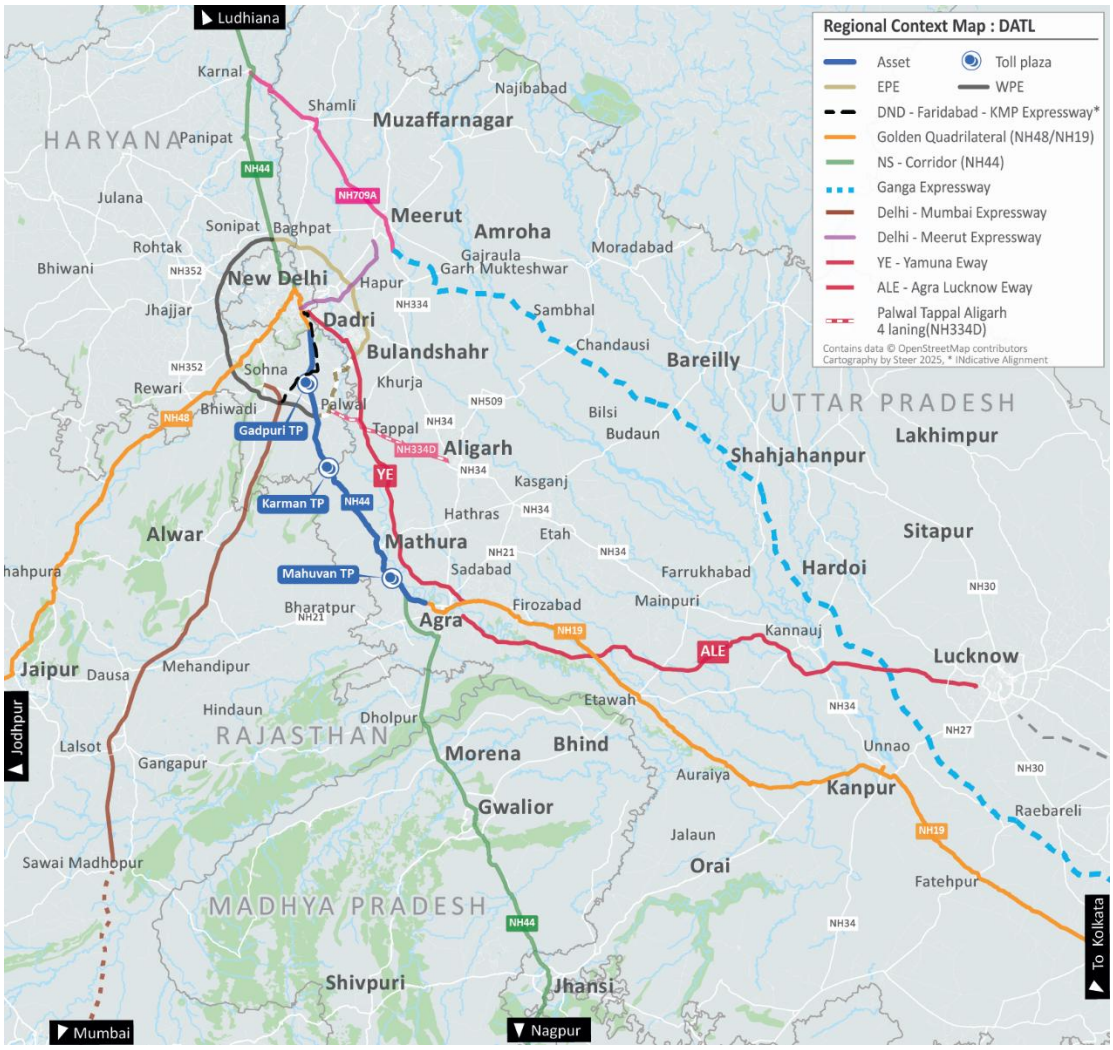
Alternate routes

Figure 2.4: Alternate routes to the Asset



Source: Steer Cartography

2.14 This Asset caters to the strategically important east-west movement - between Delhi and north-western India at one end, and Uttar Pradesh and eastern India at the other end – by virtue of its location and the linkage it provides between activity centres in the region. Figure 2.4 above illustrates other alternate routes available to users while travelling between Delhi and Lucknow. As shown in the map, the alternate routes are:

- **Asset route**: Delhi – Faridabad - Agra (via NH 44 – Kanpur - Lucknow
- **Alternate 1 route**: Delhi - Ghaziabad (via NH 34) – Aligarh – Kannauj - Lucknow
- **Alternate 2 route**: Palwal – Tappal – Aligarh – Kannauj - Lucknow (via NH334D)
- **Alternate 3 route**: Delhi - Yamuna Expressway (YE) - Agra Lucknow Expressway (ALE)- Lucknow

2.15 The Asset is also located on the strategically key north-south corridor, with NH44 traversing through Punjab, Haryana, Delhi, Rajasthan, Uttar Pradesh, Madhya Pradesh, Maharashtra, Telangana, Karnataka and Tamil Nadu. Currently there is one major alternative National Highway route for traffic with one trip end in northern India and other

in Maharashtra via NH48 corridor. Additionally, the upcoming the Delhi-Mumbai expressway will be another alternate for the traffic between Delhi NCR and Maharashtra.

Delhi-Mumbai Expressway

2.16 As aforementioned, the Asset currently connects traffic travelling between North Indian regions of Delhi, Agra, Punjab, Haryana, and beyond to regions located further south including Mumbai, and Indore, other parts of Maharashtra and beyond. In this context, a key alternative route that has materialized in recent years (since FY19) is the Delhi-Mumbai Expressway, upon expected completion by FY27, it will connect the Sohna Elevated Corridor to the Jawaharlal Nehru Port in Maharashtra, eventually becoming a key competing route to the Asset for north-west traffic movement.

2.17 The Delhi-Mumbai Expressway (DME) is a 1290-KM long greenfield expressway that has been developed to provide an improved 8-lane route to long-distance traffic between North/Western India to Mumbai[8]. Movements for which the DME serves as a directly competing alternative to the Asset route include the following:

- **Trips originating in Delhi/Punjab/Haryana/Agra destined to Indore**: For traffic to get to Indore, there is an alternate route through the expressway via Ratlam/Garoth-Ujjain.
- **Trips originating in Delhi/Punjab/Haryana/Agra destined to Mumbai**: This traffic currently uses either the NH8 corridor or NH44 and NH52 corridor. After the commencement of operations on the DME, users and commercial operators travelling this route will be presented with a cheaper, and faster alternative.
- **Trips originating in Punjab/north destined to Faridabad**: For traffic to access Faridabad from regions around Punjab, historically the preferred route passed through Palwal – Gadpuri – Faridabad. However, this movement has now shifted to the Western Peripheral in conjunction with the DME and the Faridabad spur. This shift only affects the Gadpuri (KM46) plaza.

2.18 A few sections of the greenfield expressway have been made operational with Sohna-Dausa-Lalsot section (Feb'23), Madhya Pradesh section (Sep'23), Vadodara-Bharuch section (Feb'24), Lalsot-Sawai-Madhopur section (Feb'24) and the Kota-Bundi Section (Dec'24) already being operationalised. The project is currently experiencing construction delays, mainly on the Gujarat stretch[9] and two packages near Sawai Madhopur and Mukundra hills. Once the remaining sections are made operational, the long-distance movement between Delhi/north and Mumbai/south currently appearing on the Asset could be at the risk of shifting to the alternate DME.

2.19 In addition to the DME, the 50 km stretch of the DND-KMP Flyway that will connect DND Flyway to KMP Expressway by FY27 (Package 1 is currently under construction whicle Package II and III are already operational) is expected to impact traffic growth on the Asset as part of the same broad network development. The DND-KMP Flyway was conceived as a 3-package 50 km stretch aimed to reduce congestion within Delhi NCR and Faridabad by connecting Kalindi Kunj to the DME directly for commercial vehicles travelling through Delhi and originating from the industrial clusters of Faridabad and other

[8] **Delhi - Mumbai Expressway (Times Now, April 2025)**

[9] **Delhi-Mumbai Expressway Update: Surat-Maharashtra stretch delayed,** (March 2025)

parts of NCT to the DME via Nuh in Haryana[10]. Package 3 of this development was completed in February 2023[11] and Package 2 was opened to traffic in November 2024[12]. Both these developments continue to impact Gadpuri plaza which has lost traffic over the past couple of years due to the increased access to the DME provided by these developments.

2.20 Package 1 of the DND-KMP Flyway i.e., 9km elevated corridor connecting Mithapur to DND Flyway is expected to be completed and operational by FY27[13]. Once this is completed, a further loss of traffic is expected across the NH44 corridor for the share of long-distance through traffic that continues to use the Asset between Faridabad and other locations further south, and also along the DME alignment.

3 Traffic Description

Introduction

3.1 This chapter presents historical and current traffic and revenue trends on the Asset, as well as analysis of origin-destination (OD) survey data and traffic count data. This covers data which was collected as a part of this study and in previous studies, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data was provided by the Client and was independently analysed and validated using traffic volume count (TVC) information.

3.4 The below sections present historical traffic and revenue information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.

PCU factors considered for reporting.

3.5 The PCU factors considered in Table 3-1 below are as per IRC64 1990[14]. Based on discussions with the Client, for reporting purposes, Rigid and Trailer truck splits in the TVC counts have been used for calculating the effective PCU for MAV trucks. For Rigid trailer trucks a PCU factor of 3 has been assumed, whereas for Trailer trucks a PCU factor of 4.5 as defined in IRC64 1990 [15] has been adopted.

Table 3-1: PCU factors

Vehicle category	PCU Factor
CJV	1.0
Mini LCV	1.5
LCV	1.5
Bus	3.0
2A	3.0
3A/MAV	3.72 (Gadpuri) / 3.56 (Mahuvan and Karman)

[14] **IRC 064: Guidelines for Capacity of Roads in Rural Areas**

[15] On this Asset, we have 3A/MAV combined volumes. However, for PCU calculations, to maintain consistency, we have used the shares derived from the latest TVC on the Asset (conducted in February 2026)

Vehicle category	PCU Factor
OSV	4.5

Source: Steer analysis and IRC64,1990; this PCU factor is taken as the average of the PCU factors calculated for each of the three plazas on the Asset.

Historical trends

3.6 By virtue of its location, the Asset caters to both passenger traffic and goods vehicles as it connects two major cities in north India, i.e., the NCT of Delhi, Mathura and Agra, and also connects the northern regions of Delhi, Punjab, Haryana (and beyond) to the rest of the country, including states across central, east, and south India, and all their constituent cities, industrial hubs, and trade centres. As a result, the Asset carries a healthy mix of both passenger and commercial traffic.

3.7 CJVs account for the highest volume of total traffic on the Asset as major religious sites and tourist destinations in Mathura, Vrindavan and Agra witness high volume of both domestic and international tourist traffic every year. In addition to this, the large presence of leather and textile industries [5 6] , and the IOCL refinery in Mathura also contribute to the growth of commercial traffic on the Asset.

3.8 Table 3-2 through Table 3-7 below present historical variation in tollable and total (tollable + exemptions/violations) traffic volume at all three toll plazas on the Asset, both in terms of vehicle-wise AADT as well as total PCUs. Post June 2022, the earlier toll plaza (Srinagar; KM74) was split into two toll plazas i.e., Gadpuri (KM46) and Karman (KM94) that currently continue to operate on the Asset. Therefore, the data presented in the tables below for these two plazas are for the period July 2022 to the latest available period . For Mahuvan (KM164) the data has been presented from FY19.

Table 3-2: Historical evolution in AADT by vehicle class at KM46 (Gadpuri)

Vehicle Category	FY23*	FY24	FY25	FY26	FY24- FY26 CAGR
CJV	31,943	32,776	34,852	37,604	7.1%
LCV	1,750	1,803	1,636	1,672	(3.7%)
Bus	876	949	1,074	1,168	10.9%
2A	2,122	1,774	1,740	1,653	(3.5%)
3A/MAV	3,204	2,646	2,335	2,193	(9.0%)
OSV	10	2	1	1	
AADT	**39,906**	**39,951**	**41,638**	**44,292**	**5.3%**
PCU[1]	**55,531**	**53,510**	**54,441**	**56,742**	**3.0%**

Source: Steer analysis of the Client data; FY23* consists of data from Jul'22 to Mar'23; FY26 represents full year actual (April to March); PCU totals above consider PCU factor of ~3.72 for 3A/MAV combined traffic.

3.9 Between FY24 and FY26, KM46 witnessed a CAGR 5.3% increase in AADT and 3.0% in PCU terms, primarily driven by a 7.1% rise in CJV traffic and a CAGR 10.9% growth in buses during the same period. This growth reflects strengthened intra- and inter-urban connectivity between Faridabad, Palwal and the wider Delhi NCR, supported by the plaza's strategic positioning on key corridors linking major religious and tourism hubs such as Mathura and Agra.

3.10 As mentioned in paragraph 2.19, KM46 continues to be the most impacted by the Delhi-Mumbai Expressway and DND–KMP (148NA) access, which diverts short-distance 2A and MAV traffic, thereby constraining overall PCU growth. The provision of access to the Delhi–Mumbai Expressway via NH-148NA has diverted traffic originating from Faridabad and the surrounding regions, previously destined for Sohna, Rewari, and other parts of Haryana and Rajasthan, to this alternate route. Earlier, such movements were routed via the Gadpuri Toll Plaza; however, the new connectivity now allows these trips to directly access the KMP Expressway and the Delhi–Mumbai Expressway.

Table 3-3: Historical evolution in Tollable AADT by vehicle class at KM46 (Gadpuri)

Vehicle Category	FY23*	FY24	FY25	FY26	FY24- FY26 CAGR
CJV	27,219	29,242	31,066	33,531	7.1%
LCV	1,670	1,776	1,613	1,657	(3.4%)
Bus	839	939	1,064	1,165	11.4%
2A	2,010	1,746	1,719	1,636	(3.2%)
3A/MAV	3,160	2,617	2,320	2,183	(8.7%)
OSV	10	2	1	1	
Tollable AADT	**34,908**	**36,322**	**37,782**	**40,174**	**5.2%**
Tollable PCU[1]	**50,030**	**49,710**	**50,470**	**52,551**	**2.8%**

Source: Steer analysis of the Client data; FY23* consists of data from Jul'22 to Mar'23; FY26 represents full year actual (April to March); Tollable traffic excludes exemptions and violations; 1 PCU totals above consider PCU factor of ~3.72 for 3A/MAV combined traffic.

3.11 The following tables presents the historical total and tollable traffic on KM94, Karman toll plaza.

Table 3-4: Historical evolution in AADT by vehicle class at KM94 (Karman)

Vehicle Category	FY23*	FY24	FY25	FY26	FY24-FY26 CAGR
CJV	18,232	20,026	22,117	24,619	10.9%
LCV	1,380	1,373	1,476	1,552	6.3%
Bus	775	827	894	958	7.6%
2A	3,352	3,304	3,634	3,850	7.9%

Source: Steer analysis of the Client data (MAV includes 3A across all the years; 2A includes Bus from FY19-21; FY26 represents full year actual (April to March).; tollable traffic excludes exemptions and violations; 1 PCU totals above consider PCU factor of ~3.56 for 3A/MAV combined traffic.

3.13 Since FY19, KM164 has observed strong PCU growth, posting an average annual growth rate of 8.1% per year over the period FY19-FY26. Much of this growth can be attributed to the rapid pace of development in and around Delhi NCR over the past several years where the Asset has benefitted from its strategic location, connecting Delhi NCR to other locations across the country. KM46 and KM94 have grown at rates of 3.0% and 5.5% respectively between FY24 and FY26 at a PCU level, driven majorly from steady growth

observed in CJVs, LCVs, and 2As. 3A/MAV traffic on the Asset has declined at all three toll plazas on the Asset in FY26 compared to FY25. Several factors have contributed to this, including:

- The secular decline of 3A traffic volumes – consistent with most national highway corridors in the country – due to updated axle load regulations, and a growing preference for 2As and MAVs. This contraction in 3A volumes is dampening the year-on-year growth rates for the combined total of 3A and MAV traffic volumes.
- The Delhi-Mumbai Expressway (DME) now observes a proportion of long-distance traffic which earlier used to appear on the Asset. Additionally (as detailed above in 2.19) the DND – KMP Flyway development has impacted long-distance movement appearing on the Asset by providing better access to the DME if passing through the inner areas of the National Capital.
- Upgrades to the Palwal – Tappal and Ghaziabad – Aligarh-Kanpur corridors have enhanced the Level of Service (LoS), leading to medium-distance traffic bound for Kanpur to favour the Ghaziabad – Aligarh – Kanpur route as an alternate to the asset.

Historical Revenue

3.14 Table 3-8, Table 3-9 and Table 3-10 illustrate the historical trends in total and average daily revenue collections at Gadpuri (KM46), Karman (KM94), and Mahuvan (KM164). In FY25, all three toll plazas recorded year-on-year growth in Average Annual Daily Collections (AADC) compared to FY24. AADC increased by 3.3% at KM46, 6.7% at KM94, and 5.3% at KM164 over FY24 levels. In FY26, revenue growth was 8%, 5.9%, and 6.0% at the toll plazas respectively. Gadpuri's revenue growth in FY26 was stagnant due to the diversion of traffic to the DME connector.

3.15 As explained in the historical traffic section, this growth has been driven primarily by the increase in CJVs, LCVs, and 2As, as consumption demand from the urban consumption hubs of Faridabad, Delhi, Mathura and Agra continues to grow. Delhi and Agra also continue to grow as major tourism destinations for both domestic and international travellers.

Table 3-8: Historical total revenue (INR Cr) and AADC (INR Lakhs): TP Gadpuri (KM46)

Toll Plaza	CJV	LCV	Bus	2A	3A/MAV	Total	AADC	AADC Growth (%)

Toll Frequencies

3.16 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. Each vehicle category has a different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the Client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some Assets offer custom made local passes to attract the local commuters to opt for these category passes instead of evading tolls. Brief descriptions of the different ticket types are provided in Table 3-11 below.

Table 3-11: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Daily pass for crossing the toll plaza multiple times within 24 hours. Charged 1.5 times the single toll
Monthly	Discounted entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted monthly pass only for private cars of residents within 20KM radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.17 Understanding the toll frequency gives insights into the nature of traffic plying on the Asset. CJVs generally have higher shares of return tickets or monthly passes as passenger vehicles typically travel shorter distances and are more regular/routine than commercial movements; heavy trucks mostly have single tickets as these trips are longer distance and vehicles may not be appearing on the same plazas as frequently given the nature of commercial transportation. Nonetheless, the exact shape and form of these ticket type distributions across different vehicle categories vary from Asset to Asset or even toll plaza to toll plaza. The Asset catering to short distance local traffic generally observes high share of return or other local, and monthly passes while an Asset catering to strategic long-distance traffic generally observes a high share of single ticket traffic.

Introduction of Annual pass for CJVs

3.18 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.19 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

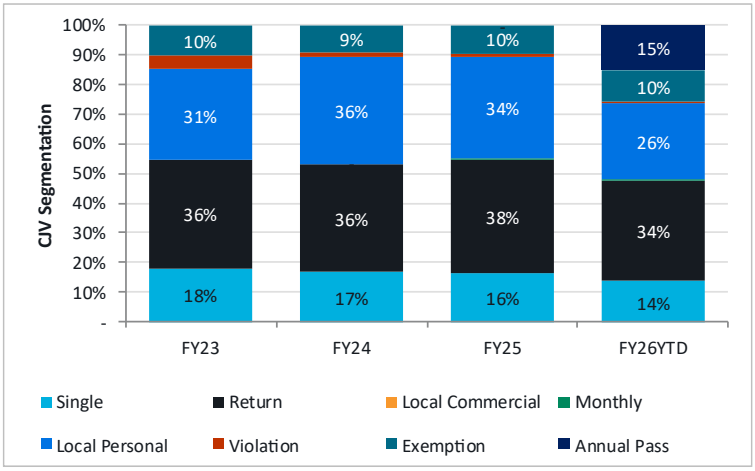
The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll road

Share of traffic by payment type

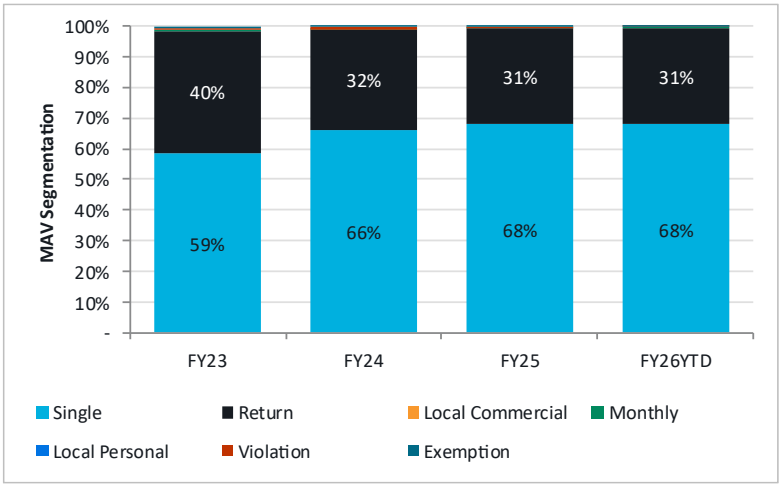
3.20 Figure 3.1 through Figure 3.4 below illustrate CJV and MAV ticket segmentations observed at KM46 (Gadpuri) and KM94 (Karman) toll plazas for the period FY23 (partial, July 2022-March 2023) through FY26YTD (April 2025- February 2026).

Figure 3.1: CJV Ticket-segmentation at KM46 (Gadpuri)



Source: Steer analysis of Client data; FY23 consists of data from Jul'22 to Mar'23; FY26YTD contains data thru Feb'26

Figure 3.2: MAV Ticket-segmentation at KM46 (Gadpuri)

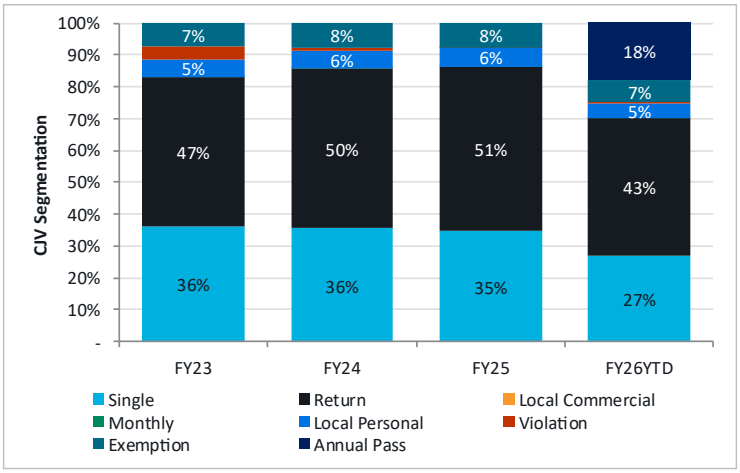


Source: Steer analysis of Client data; FY23 consists of data from Jul'22 to Mar'23; FY26YTD contains data thru Feb'26

3.21 As discussed earlier, two of the Asset toll plazas i.e., KM46 (Gadpuri), and KM94 (Karman), became operational after the original Srinagar toll plaza (prior KM74) was split into two different plazas in July 2022 (FY23). From graphs above, we see that ticket segmentation trends at both the plazas follow from their geographic locations along the Asset; KM46 (Gadpuri), the plaza located nearest to Delhi NCR and between the urban settlements of Delhi/Faridabad and Palwal, observes a high share of local traffic, or traffic volumes captive to the area. At KM46, commercial trucks (MAVs) also make short-distance trips within Delhi-NCR, as evidenced from the high share of MAV return tickets on this plaza (as compared to KM94 and KM164). As of FY26YTD, 31% of MAVs were return trips at KM46.

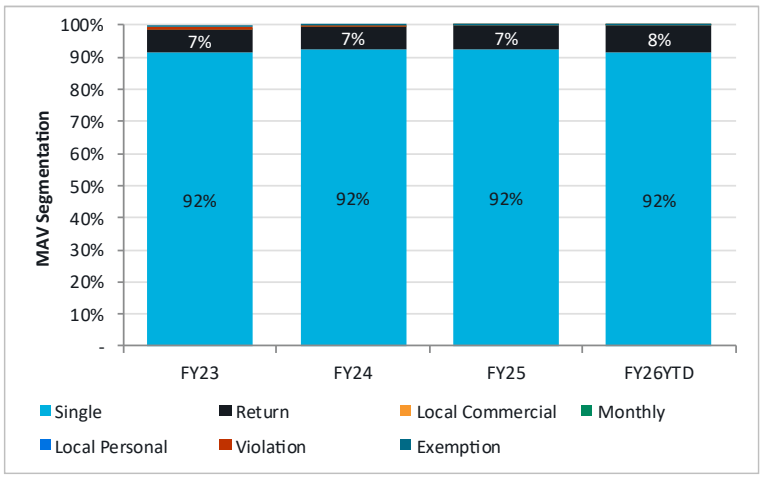
3.22 KM94 (Karman) observes more long-distance traffic than observed at KM46, largely because it is located farther away from urban centres on either end of the Asset, meaning most traveller crossing KM94 are likely longer-distance in nature. As shown in Figure 3.3 and Figure 3.4 below, this is supported by the significantly lower share of return tickets (and correspondingly higher share of single tickets) observed at KM94 relative to KM46. This observation is further validated by 2A/3A categories reporting a smaller share of return tickets in their segmentations at KM94.

Figure 3.3: CJV Ticket-segmentation at KM94 (Karman)



Source: Steer analysis of Client data; FY23 consists of data from Jul'22 to Mar'23; FY26YTD contains data thru Feb'26

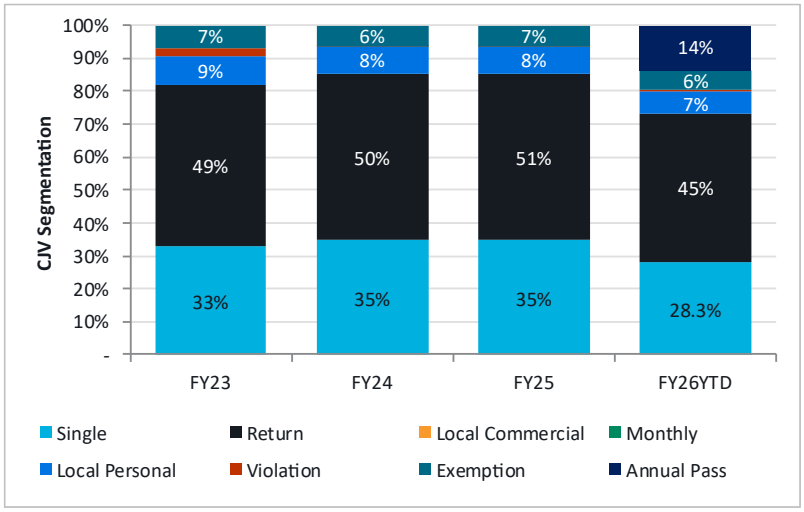
Figure 3.4: MAV Ticket-segmentation at KM94 (Karman)



Source: Steer analysis of Client data; FY23 consists of data from Jul'22 to Mar'23; FY26YTD contains data thru Feb'26

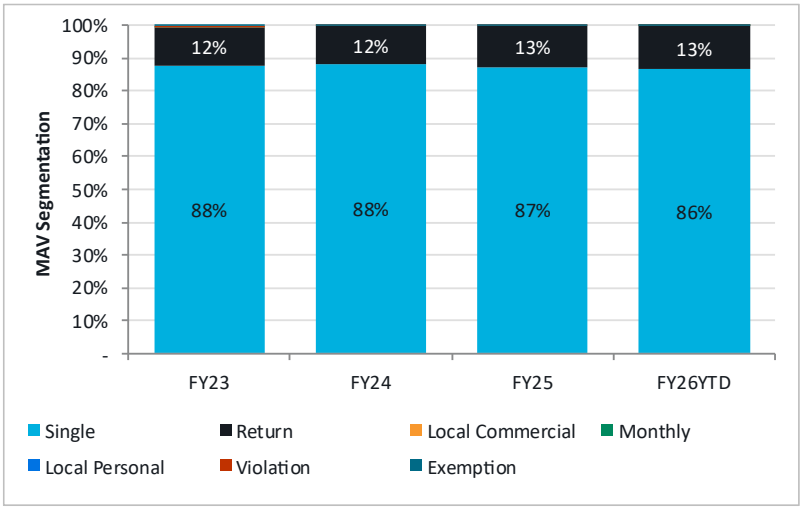
3.23 Figure 3.5 and Figure 3.6 below present ticket segmentation for CJVs and MAVs at KM164 (Mahuvan). Since the adoption of FASTag in FY21, the share of single tickets purchased by CJVs at KM164 (Mahuvan) has stabilized, and as of FY26YTD is 29%. The proximity of KM164 to Agra and nearby urban centres further explains the high share of return tickets for CJVs – which has been roughly 45-52% across the past four years.

Figure 3.5: Ticket-segmentation for CJV at KM164 (Mahuvan)



Source: Steer analysis of Client data; FY26YTD contains data thru Feb'26

Figure 3.6: Ticket-segmentation for MAV at KM164



Source: Steer analysis of Client data; FY26YTD contains data thru Feb'26

3.24 The share of single tickets at KM164 Mahuvan is high (86%, as of FY26YTD) implying MAVs observed on the asset are long-distance – significantly more than KM46 (68%). Additionally, the share of return tickets for MAVs are still higher than that observed at KM94 meaning that KM164's proximity to Agra and nearby urban centres also influence the nature of MAV trips observed at KM164 - where some proportion of commercial trucks are also short-distance - lower than KM46, but higher than KM94.

Data Collection exercise

3.25 As mentioned previously, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed in Table 3-12 below. OD survey data was collected on behalf of the Client, and TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic crossing the toll plazas, followed by manual counting.

Table 3-12: Data collection schedule

TP	3-day videography-based TVC			1-day OD survey	
	Start date	End date	Time (hrs)	Start date	Start time
KM46 Gadpuri	25th Feb 2026	27th Feb 2026	0000-2359	25th Feb 2026	0900 hours
KM164 Mahuvan	26th Feb 2026	28th Feb 2026	0000-2359	27th Feb 2026	0900 hours
Kherli Jita toll plaza (DME connector)	19th Mar 2026	21st Mar 2026	0000-2359	19th Mar 2026	0900 hours

Source: Steer

3.26 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic

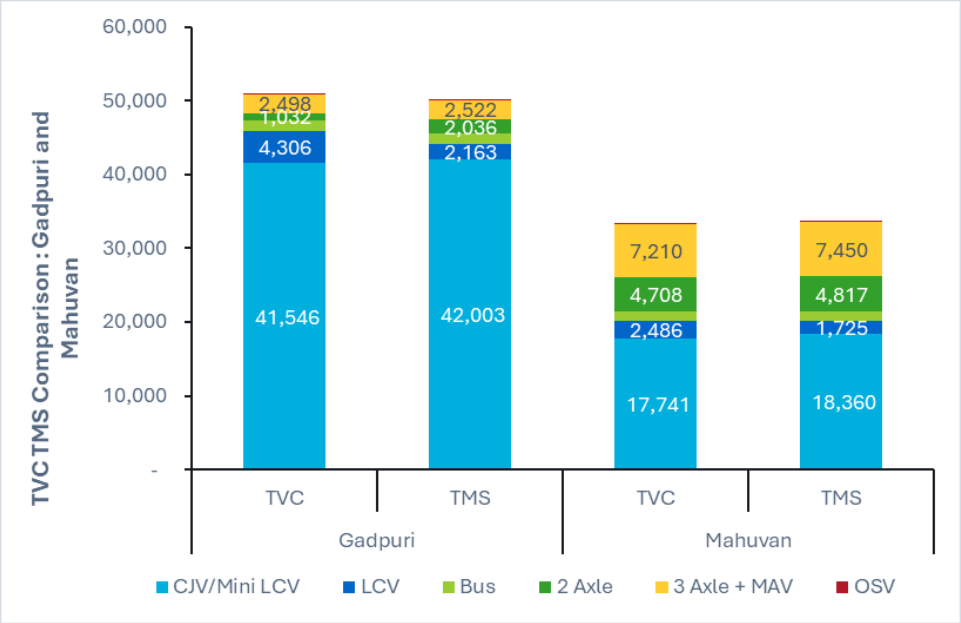
counts are generally recommended. Hence, in order to fully understand the impact of this weekly fluctuation on the Asset, we collected three-day counts at each toll plaza.

Key findings of the TVC data analysis

3.27 The results of the TVC study carried out by Steer in February 2026 are presented in this section. TVC surveys were conducted to help validate TMS data provided by the Client, and to inform various inputs used in our forecasting analysis.

3.28 Since we use the TMS data to estimate the base year AADT, we have used our overlapping TVC data to validate the TMS data on those days, as provided by the Client. In Figure 3.7 below, we observe that over the period (or days) for which the TVC data was collected, there existed little difference between the reported TMS traffic count data and the independently recorded TVC data. Based on this output, we independently validated the TMS count data provided by the Client, and no additional adjustment (in this respect) was made to estimate our Base year AADT from the TMS data provided by the Client.

Figure 3.7: TVC-TMS Comparison: KM46 Gadpuri & KM164 Mahuvan



Source: Steer analysis

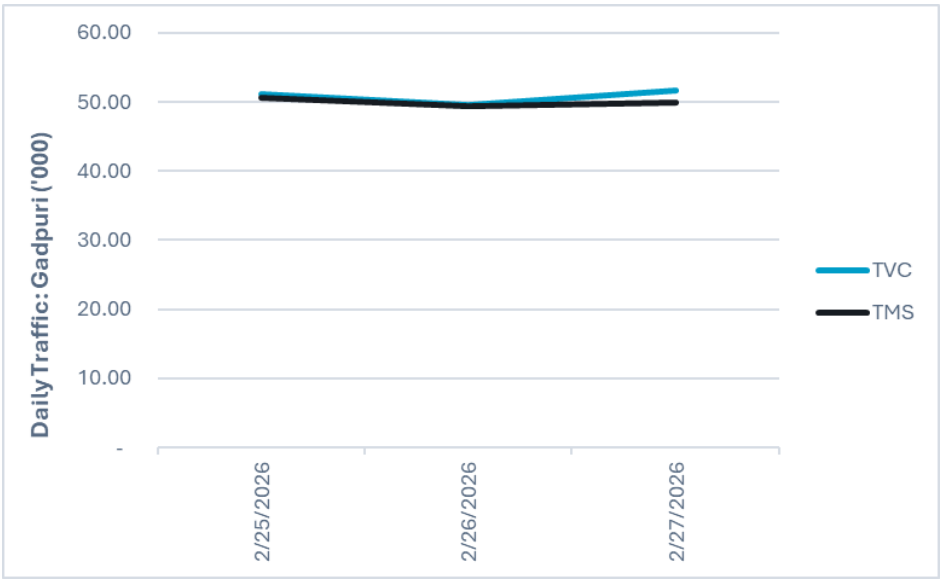
TVC-TMS analysis

3.29 Figure 3.8 and Figure 3.9 below present our analysis of the TVC data sourced via independent primary surveys and the TMS data provided by the Client over the same data collection period/days i.e., 25th February 2026 to 27th February 2026. We used our TVC data to validate the toll plaza data for the same days as supplied by the Client via their toll management system (TMS). This TMS data was then used as the base data, for our forecasting model.

3.30 The graphs show the comparison of TMS and TVC calculated Average Daily Traffic (ADT) levels at two of the plazas on which the surveys were conducted i.e., KM46 (Gadpuri) and KM164 (Mahuvan). The TMS data from the Client's operational systems at both plazas closely aligns with our third-party TVC data for the same days, showing a difference of 1.6% at Gadpuri and (1.0%) at Mahuvan toll plaza. This comparison provides confidence

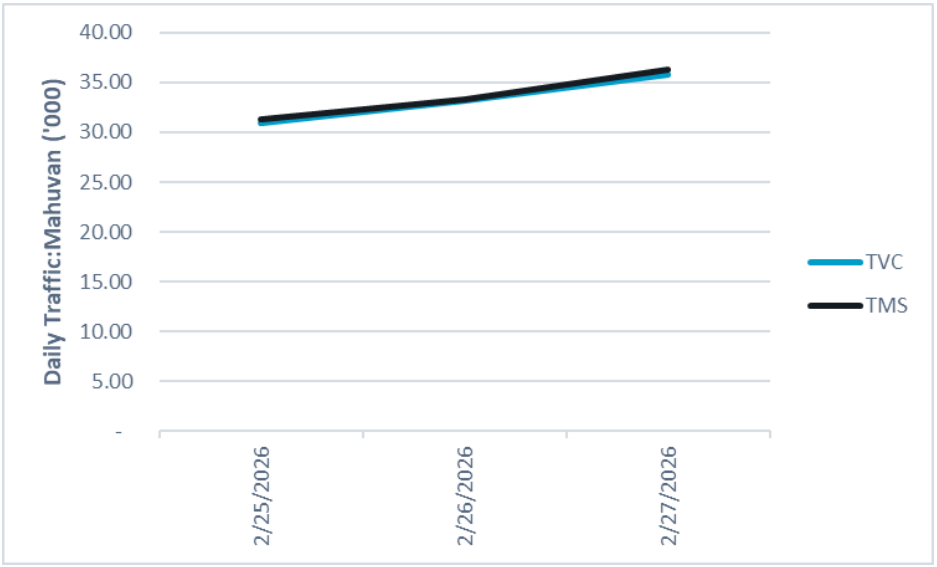
in the TMS data for forecasting purposes and ensures that the data being used to estimate the Base year AADT (and subsequent forecasts of traffic and revenue from that Base) is accurate and reflective of actual plaza volumes.

Figure 3.8: Daily TVC and TMS traffic comparison on KM46



Source: Steer analysis

Figure 3.9: Daily TVC and TMS traffic comparison on K164



Source: Steer analysis

3.31 TVC survey was also conducted at Kherli Jita toll plaza on the DME connector. Due to lack of TMS data for Kherli Jita, a comparison with TMS data could not be undertaken. CJVs form about 78% of the traffic appearing on Kherli Jita, with 2As, 3As, and MAVs forming 13% combined.

Key findings of origin-destination analysis

Overview

3.32 Origin-destination (OD) analysis enables us to understand the nature of traffic movement on the Asset. The OD analysis presented here is based on data collected on behalf of the Client in February 2025. OD surveys were conducted at two of the toll plazas on the Asset i.e., at KM46 (Gadpuri), and at KM164 (Mahuvan) owing to the difference in traffic trends and movements observed at both these plazas. Given the similarity in traffic profiles observed at KM94 and KM164, no additional OD survey was commissioned for KM94. The OD data collected as part of this study was analysed to derive the following key insights regarding the nature and profile of traffic plying the Asset:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.33 While zonal analysis and the list of top OD pairs help us to understand ‘where’ people and goods travel, commodity distribution sheds light on ‘what’ goods get transported. Trip length distribution show ‘how far’ vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and to inform our key forecasting assumptions around traffic demand elasticities, growth drivers, and other exogenous factors that may impact future traffic growth on the Asset.

Sample rates

3.34 Sample rates help understand the reliability of OD data. They are calculated by dividing OD sample counts from the OD surveys by traffic counts (based on the TVC data) over the survey period. Table 3-13 below presents the sample rates for key vehicle categories at both the Asset toll plazas.

3.35 Sample rates at toll plazas are typically low for passenger vehicles due to shorter stoppage durations and reduced response times following the implementation of FASTag in FY22. On the contrary, sample rates for commercial vehicles are higher.

3.36 Table 3-13 below presents the sample rates recorded at KM46 Gadpuri and KM164 Mahuvan for both passenger and commercial vehicles.

Table 3-13: Sample rates for OD data

Vehicle type	KM46 Gadpuri	KM164 Mahuvan	Kherli Jita
Passenger	28.3%	20.7%	38.0%
Goods (2A+3A+MAV)	63.1%	34.7%	47.7%

Source: Steer analysis of OD data

Zone categories

3.37 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in Table 3-14 below. The methodology applied to aggregate zones vary based on the characteristics of different Assets.

Table 3-14: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
Immediate area of influence (IAOI)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 KM distance from the Asset.
Rest of State	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Central NCR	Delhi, Gurgaon, Noida.
Rest of Haryana	Haryana
North India	Uttarakhand, Jammu & Kashmir, Himachal Pradesh
Madhya Pradesh	Madhya Pradesh
Rajasthan	Rajasthan
Punjab	Punjab
Uttarakhand	Uttarakhand
Gujarat	Gujarat
East and Northeast India	West Bengal, Orissa and Northeast Indian states
South India	Andhra Pradesh, Tamil Nadu, Karnataka, Kerala, Maharashtra, Goa

Source: Steer analysis

Zonal influence

3.38 Zonal influence measures the contribution of a zone or zonal aggregation/region to traffic volumes plying on the Asset, by vehicle type[16]. This section presents the zonal influence[17] of different zones (as described in Table 3-14 above) at both the toll plazas where OD surveys were conducted in February 2025 i.e., KM46 (Gadpuri) and KM164 (Mahuvan). Figure 3.11 and 'Local' trips on the Asset are mainly destined towards or originating from areas within a 20 km radius of the Asset, including locations such as Runakta, Sikandra, Mathura (all in Uttar Pradesh and Ballabhgarh (in Haryana).

3.39 As we can see in the figures below, commercial traffic at Gadpuri has more influence of short distance and medium distance trips as around 80% of MAV traffic has influcne of local zones and of Haryana and Delhi, while the same for Mahuvan reduces to around 60%, and the sahre of long distance traffic to zones such as South India, Rajasthan among others increases to 40% from around 15% on Gadpuri.

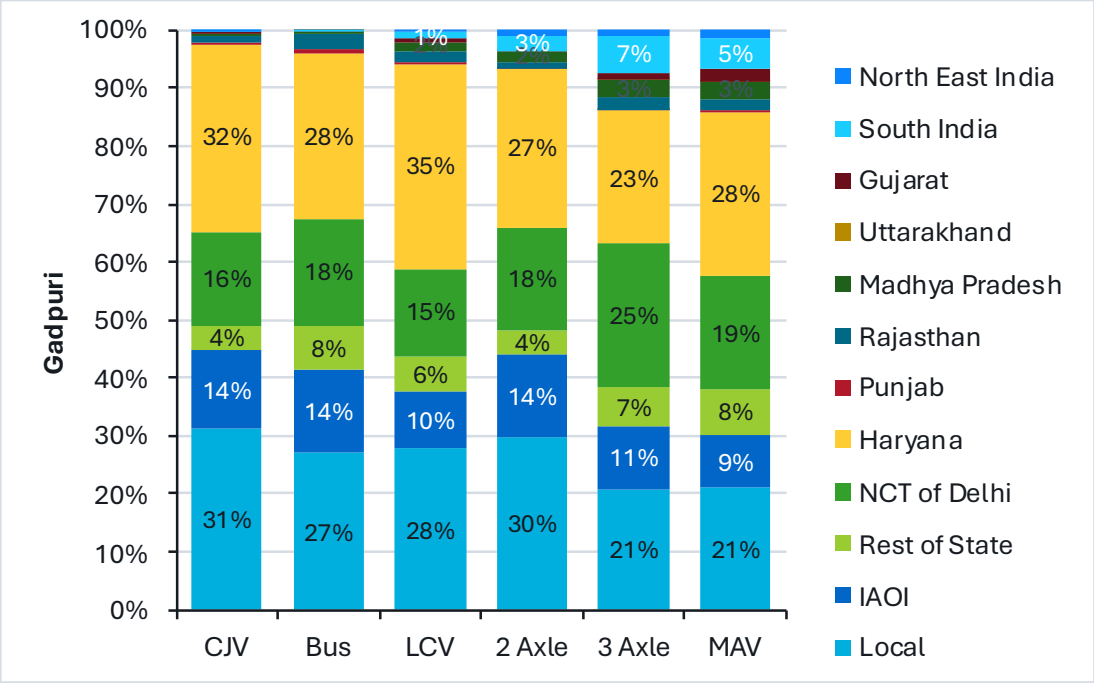
3.40 Figure 3.12 below present the zonal influence of different zones on traffic volumes of each vehicle category that cross both the toll plazas.

3.41 Long distance traffic destinated to destinations outside the state form a high share of trips for commercial traffic. Influence of local and IAOI zones ranges between 20-30% for MAV's on each these plazas, representing captive nature of the traffic. For inter-urban corridors, only smaller vehicles (CJVs and LCVs) see a higher share of local trips compared to trucks. However, since we see industrial zones located on the Asset itself, the influence of zones located in immediate regions (inclusive of parts of all three regions) is high even for heavy trucks like MAVs, which range from 25% at KM164 to 30% at KM46.

[16] Zonal influence is analysed on trip ends and not trips.

[17] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad is 50% since one trip end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Figure 3.11: Zonal influence, KM46 Gadpuri

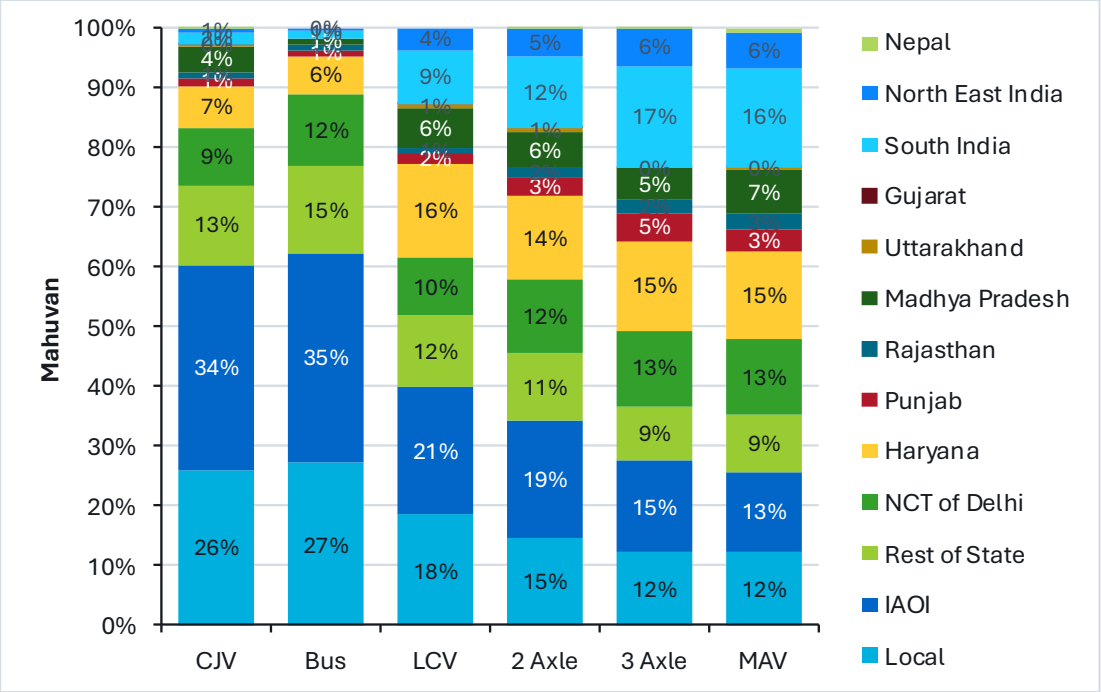


Source: Steer analysis of OD data

3.42 'Local' trips on the Asset are mainly destined towards or originating from areas within a 20 km radius of the Asset, including locations such as Runakta, Sikandra, Mathura (all in Uttar Pradesh and Ballabhgarh (in Haryana).

3.43 As we can see in the figures below, commercial traffic at Gadpuri has more influence of short distance and medium distance trips as around 80% of MAV traffic has influcne of local zones and of Haryana and Delhi, while the same for Mahuvan reduces to around 60%, and the sahre of long distance traffic to zones such as South India, Rajasthan among others increases to 40% from around 15% on Gadpuri.

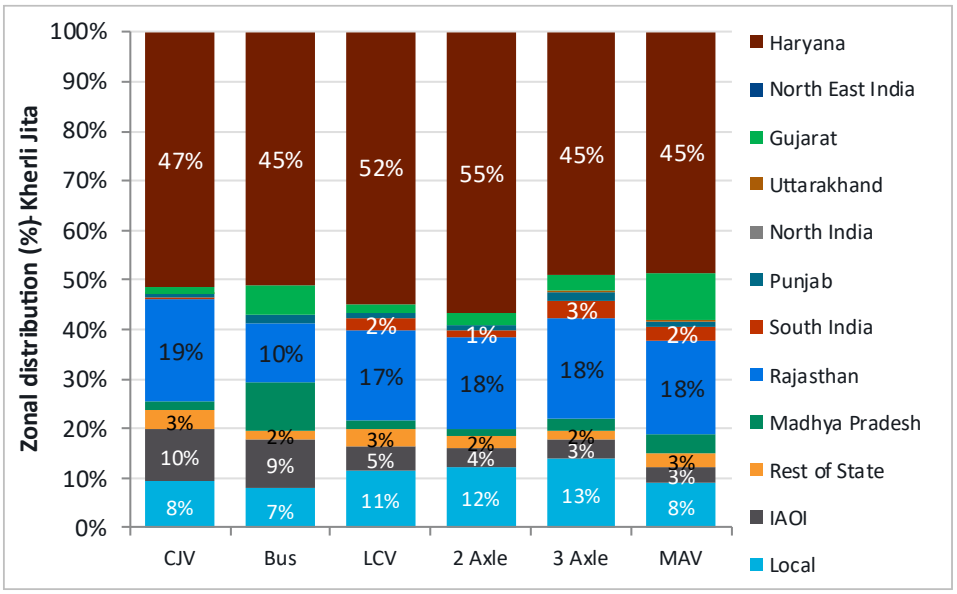
Figure 3.12: Zonal influence, KM164 Mahuvan



Source: Steer analysis of OD data

3.44 As we can see in the figures below, roughly half of the traffic appearing on Kherli Jita has one end in Haryana. Rajasthan forms ~18% of the 3A and MAV traffic each.

Figure 3.13: Zonal influence, Kherli Jita



Source: Steer analysis of OD data

Internal External analysis

3.45 Internal-External analysis helps in identifying the trips which either have both the origin and destination within the regions close to the Asset, or any only one end in the region, or

if it is through-traffic (i.e., with both trip ends outside the immediate region of the Asset), that travel medium to long distances across the country.

3.46 Figure 3.14 and Figure 3.15 below present the outputs of the Internal-External analysis conducted on the latest OD survey data at both the Asset toll plazas i.e., KM46 (Gadpuri) and KM164 (Mahuvan). The plots help provide additional insight into the trip patterns of different vehicle types observed on the Asset.

Figure 3.14: Internal-external distribution, KM46 Gadpuri

	Internal	Rest of State	External
External	3%	1%	0%
Rest of State	20%	5%	16%
Internal	37%	9%	9%

Source: Steer analysis of OD data

Figure 3.15: Internal-external distribution, KM164 Mahuvan

	Internal	Rest of State	External
External	17%	20%	7%
Rest of State	7%	5%	12%
Internal	12%	7%	12%

Source: Steer analysis of OD data

3.47 Figure 3.15 and Figure 3.17 above show that the influence of local and IAOI zones for MAVs reduces on the Asset, from the northern to the southern toll plazas. The external-external influence is lower at KM46 (almost 0%), while it has the higher (37%) share of I-I trips.

3.48 This difference in trip patterns of MAVs crossing either of the toll plazas is due to their relative locations along the Asset alignment. The KM46 plaza lies at the southern end of the NCR which is a major industrial and manufacturing region (with hubs such as Ballabhgarh, Okhla and Manesar), as well as being a large consumption centre. Thus, a large proportion of "Internal- Internal" MAV trips at this plaza are those between different industrial units across NCR as well as the traffic between industries and consumption centres in the region.

3.49 In contrast to Gadpuri, the E-E and I-I shares at KM164 (Mahuvan) are 7% and 12% respectively. KM164 lies closer to Agra and further away from Delhi resulting in a lower share of local trips for MAVs, as there are less industrial clusters in this region, and most traffic observed in this area will be medium-long distance traffic originating and destined for locations far away from where the plaza is located.

3.50 At Kherli Jita toll plaza, the share of trips with one end in external zone is relatively higher at ~70%, with trips that have one end in an internal zone forming 65% in MAVs.

Figure 3.16: Internal-external distribution, Kherli Jita

	Internal	Rest of State	External
External	31%	8%	-
Rest of State	7%	2%	4%
Internal	19%	5%	24%

Source: Steer analysis of OD data

Commodity distribution

3.51 For the commodity distribution analysis, we grouped various commodities into aggregate categories for ease of interpretation, as shown in Table 3-15 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3-15: Aggregate commodity categories

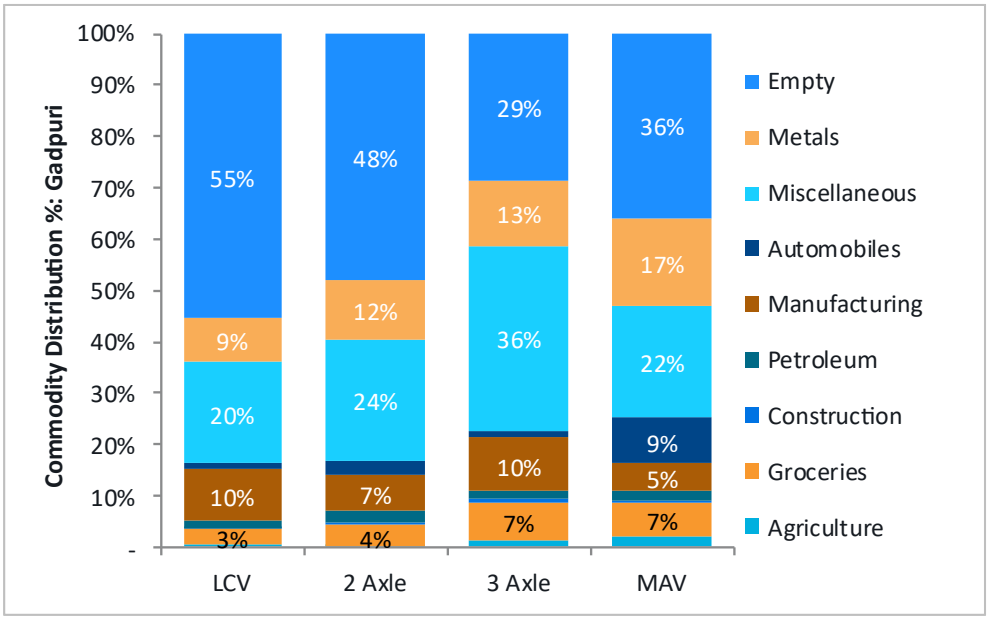
Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, goat, cow, cattle food etc)	LIV	

Commodity Description	Code	Combined codes used for charts
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cold drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood, Cork & Wood Products, Furn	WUD	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Machinery / Spare parts	MAC	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, House hold items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

3.52 Figure 3.17 and Figure 3.18 below present the commodity distribution for goods vehicles at both the toll plazas where the OD surveys were conducted. Analysis of the commodity distribution at both toll plazas reveals that construction items, groceries, manufactured products, miscellaneous goods (including parcels), agricultural products and metals represent the predominant categories. These commodity groups collectively account for approximately 62% and 61% of the traffic volume for 3-Axle vehicles (3A) and Multi-Axle Vehicles (MAV) at the Gadpuri toll plaza, and approximately 74.5% and 61.1% for 3As and MAVs at the Mahuvan toll plaza, respectively.

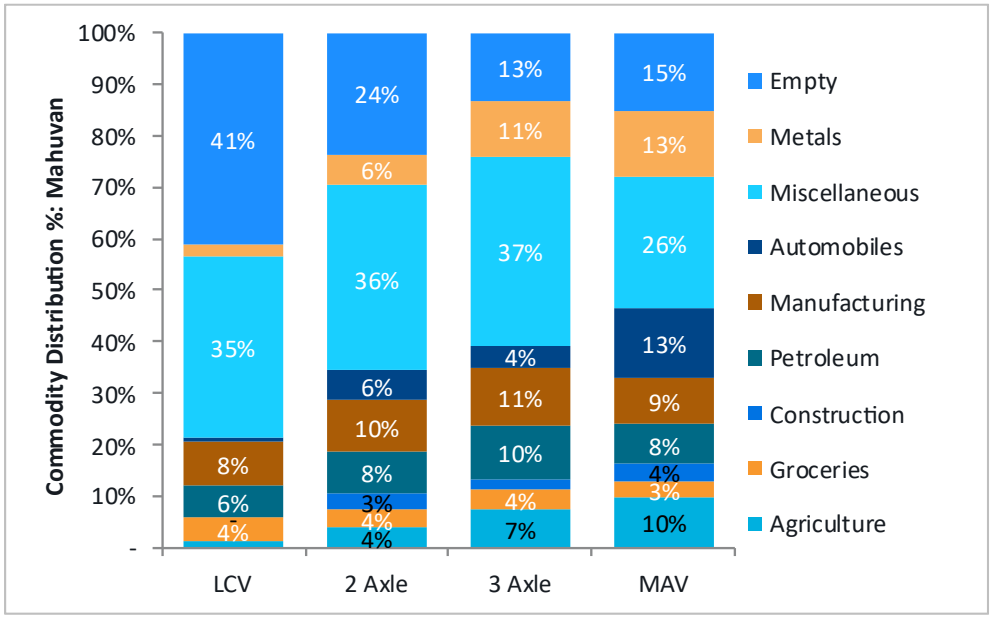
Figure 3.17: Commodity distribution, KM46 Gadpuri



Source: Steer analysis of OD data

3.53 Miscellaneous commodities (such as Parcel, Courier, House hold items etc), manufactured items (such as plastic, electronics and medicines), metals (iron and steel), and automobile have the highest share in terms of commodity distribution at both toll plazas. At KM46 Gadpuri, these categories have a combined share of 60% for 3A and 49% for MAVs, while at KM164 Mahuvan, these shares are found to be 62% for both 3A/MAVs.

Figure 3.18: Commodity distribution, KM164 Mahuvan



Source: Steer analysis of OD data

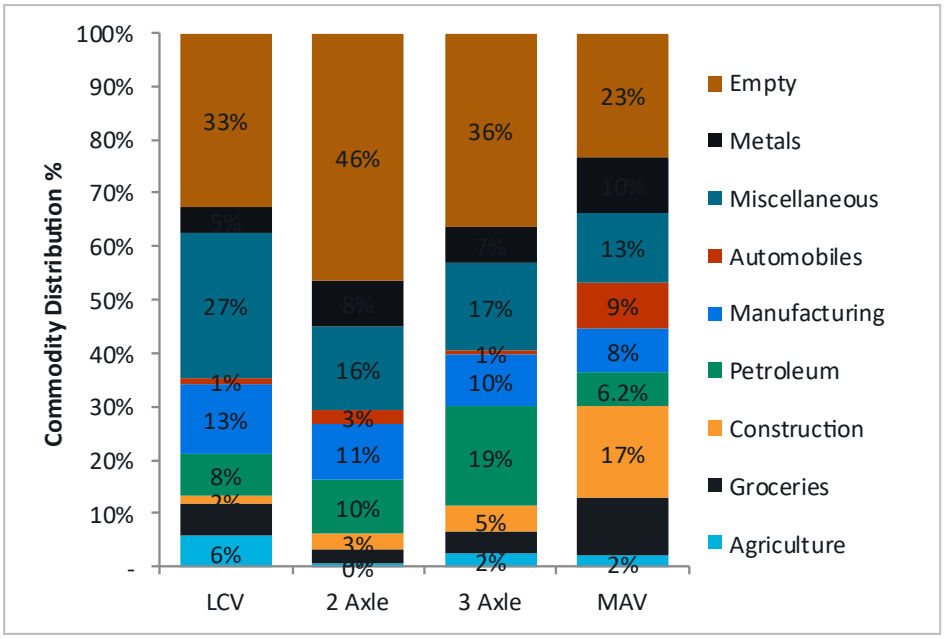
3.54 The share of empty vehicles is higher for LCVs and lower for 2A/3A/MAVs. Amongst 2A/3A/MAVs, the range of empty vehicle share is 30-48% at KM46 (Gadpuri), while at KM164 (Mahuvan) this range is observed to be 12-25%. This is expected as more local

truck movements at KM46 results in them making more trips for loading and unloading at warehouses.

3.55 Miscellaneous commodities (which include couriers and parcels) are observed to have a share of 20 -35% across all goods vehicle categories at KM46 (Gadpuri). This share is much higher at KM164 (Mahuvan), where 35-40% of LCV/2A/3As are observed to carry miscellaneous goods.

3.56 At Kherli Jita, the main commodity was found to be construction-related commodities such as cement, sand, and stone – forming about 17% of the MAV traffic. Agriculture and groceries contributed to 13% of the MAV traffic. Due to the toll plaza's proximity to urban centres, the share of miscellaneous traffic is also high at 13% in MAVs.

Figure 3.19: Commodity distribution, Kherli Jita



Source: Steer analysis of OD data

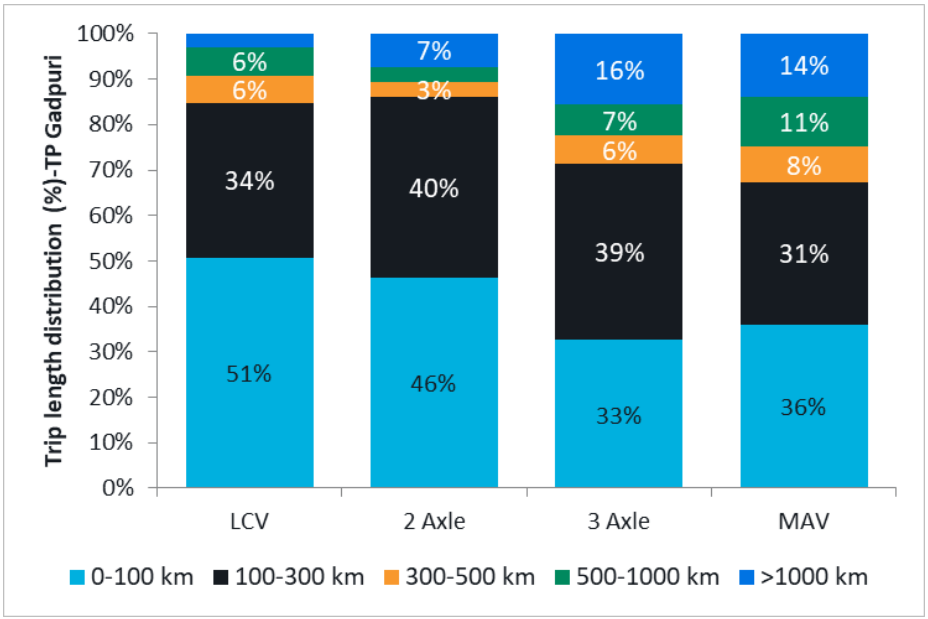
Trip length analysis

3.57 Trip-length distribution provides distance-based profiles of each vehicle category crossing either of the toll plazas. This insight, in addition to explaining trip patterns of traffic plying the Asset, also helps to validate our assumed macroeconomic drivers of traffic, outputs from the zonal influence analysis, and each plaza's toll segmentation trends.

3.58 Figure 3.20 and Figure 3.21 below present the outputs of the trip length analysis performed on the OD survey data from both the plazas. Each plot shows the distribution of total trips (by each vehicle category) across different trip distances. For ease of interpretation, we have categorised distances into five groups – local (0-100KM), short-distance (100-300 KM), medium-distance (300-500 KM), long-distance (500-1000 KM) and very-long-distance (+1,000 KM). The trip distances were derived as driving distances from Google

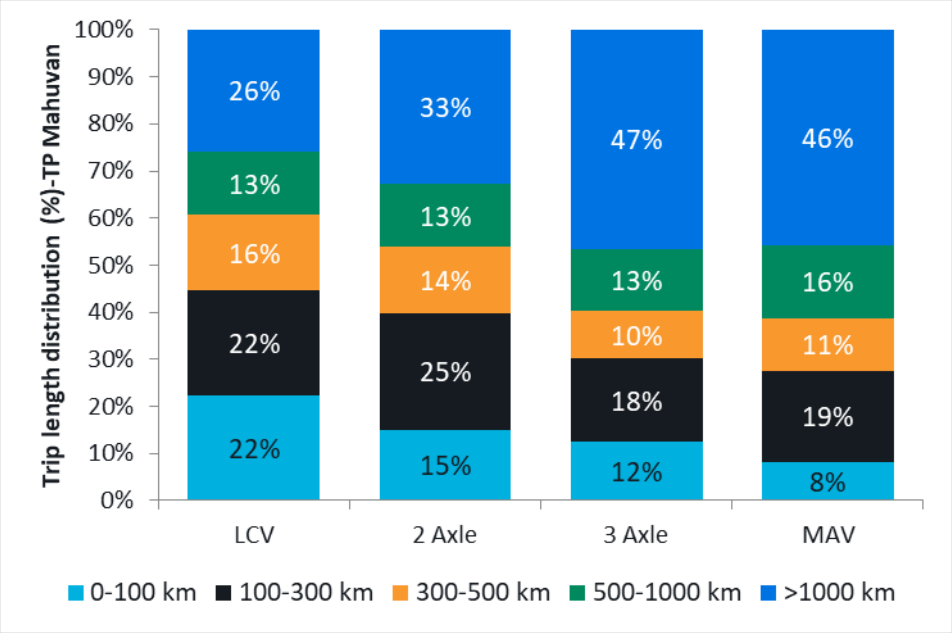
Distance Matrix Tool and is based on the zonal coordinates of each OD pair recorded during the OD surveys[18].

Figure 3.20: Trip length distribution, KM46 Gadpuri



Source: Steer analysis of OD data

Figure 3.21: Trip length distribution, KM164 Mahuvan



Source: Steer analysis of OD data

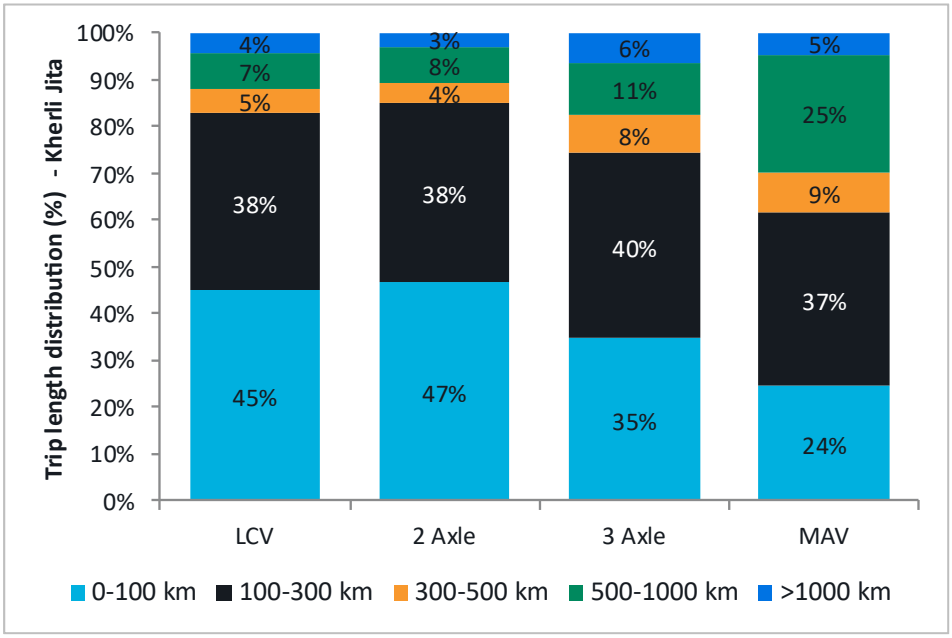
[18] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: https://developers.google.com/maps/documentation/distance-matrix/start. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

3.59 As discussed in the previous sections, KM46 (Gadpuri) and KM164 (Mahuvan) have distinct distributions of trip lengths by each vehicle category. As shown in Figure 3.20 above, KM46 (Gadpuri) observes a high share (64-85%) of trips below 300km in distance, across all goods vehicle categories. This is due to its proximity to the densely-populated NCR area, facilitating more local and IAOI movement.

3.60 In contrast, the trip distribution analysis at KM164 (Mahuvan) reflects more of its long-distance nature of traffic as observed at the toll plaza; 47% of 3As and 46% of MAVs crossing the plaza make trips more than 1000km in length, validating our observations from the zonal distribution and internal-external analyses. As we move from north to south along the Asset, the influence of states such as Madhya Pradesh, Rajasthan and regions in South India (Bengaluru, Hyderabad, Chennai) increases.

3.61 The trip length distribution of Kherli Jita is similar to Gadpuri toll plaza as it facilitates similar movements.

Figure 3.22: Trip length distribution, Kherli Jita



Source: Steer analysis of OD data

3.62 The primary objective of carrying out OD surveys at Kherli Jita and Gadpuri was to estimate the split of north-south traffic between the two toll plazas. This would help in understanding the extent to which diversion of traffic took place from Gadpuri to the DME connector and how much potential there is for further diversion of traffic to occur.

Table 3-16: Split of north-south traffic between Kherli Jita and Gadpuri

	Kherli Jita	Gadpuri
CJV	40%	60%
LCV	38%	62%
2 Axle	64%	36%
3 Axle	49%	51%
MAV	42%	58%

Source: Steer analysis of OD data

3.63 It can be seen that among CJVs, LCV, and MAVs the share of inscope traffic (north to south) lying on Kherli Jita is approximately 40%, while 60% still continues to use Gadpuri toll plaza.

Conclusions

3.64 The Asset is a 179.5 km toll road between Delhi and Agra which has historically been a part of NH44, which is a major National Highway facilitating north-south movement. It is also the longest national highway in the country.

3.65 The Asset consists of three toll plazas – KM46 (Gadpuri), KM94 (Karman) and KM164 (Mahuvan). KM46 and KM94 started operations in July 2022, while KM164 has been operational since FY13. In terms of total AADT, the growth rates at the plazas in FY26YTD compared to FY25 is 5.6%, 7.5% and 6.5% respectively. When considering the total PCUs, the plazas have grown at 3.7%, 5.1% and 4.1% respectively over the same period in FY25 to YTD FY26.

3.66 KM46 has observed muted growth overall and in PCU terms largely due to the impact of the DME as well as the DND KMP Flyway packages 2 and 3 that become operational in February 2023 and November 2024 resulting in decline in commercial vehicles originating from the industrial clusters of Faridabad and other parts of the NCT of Delhi, that previously crossed KM46. In contrast KM94 and KM164 have exhibited strong growth over FY25 levels despite the loss of long-distance traffic volumes due to partial commissioning of Delhi-Mumbai expressway, upgrade of Aligarh Kanpur (NH34) and though traffic previously coming from KM46 as these two plazas have always observed more long-distance traffic and also observe traffic that never crosses KM46 i.e., traffic that originates further north of Delhi, bypasses it using the EPE or WPE/KMP (including KM46) but then connects with the Asset at Palwal to continue on their journey's southbound or eastbound from Delhi.

3.67 The TVCs conducted by Steer in February 2026, at KM46 (Gadpuri) and KM164 (Mahuvan) toll plazas found that at the total level, TMS counts were 1.6% lower than TVC counts at KM46, and 1.0% higher than TVC counts at KM164. Although the difference between the TMS and TVC counts is slightly higher at KM164 than evaluated at KM46, the magnitude of variation may arise due to etc reconciliation as volume of traffic is quite high, allowing us to validate the TMS data with the independent TVC data collected as part of this study.

3.68 The OD analysis conducted by Steer in February 2026 found that KM46 (Gadpuri) exhibits a higher share of local trips compared to KM164 (Mahuvan) – expected given KM46's closer proximity to Delhi NCR and other nearby urban and commercial clusters relative to KM164, which is farther away and though closer to Agra, does not observe similar volumes of locally originating traffic. At both the plazas, a high share of local and IAOI trips were observed for both passenger and commercial vehicles due to the presence of urban clusters such as Agra, Mathura, Palwal, Ballabhgarh, Faridabad

3.69 An analysis of commodity distribution at Gadpuri and Mahuvan reveals that in terms of 3A/MAVs, the key commodities transported on the Asset include leather & textiles, manufactured items, fabricated metal sheets (as discussed above in 2.11), - which combined make up around 40-50% of the commodity share at both plazas, for 3A/MAVs .

3.70 When considering the internal-external analyses for MAVs at both the plazas, KM164 (Mahuvan) was found to have a greater share of External-External trips (7%) compared to

KM46 Gadpuri (0%). KM46, due to its proximity to Delhi, also observes 40% of MAV trips with both ends within an internal region. The trip length analysis supports these findings, with MAVs at KM46 having a large share (85-65%) of trips below 300km in length, while 62% of MAV trips at KM164 are more than 500km in length.

3.71 Among CJVs, LCV, and MAVs the share of inscope traffic (north to south) lying on Kherli Jita is approximately 40%, while 60% still continues to use Gadpuri toll plaza.

4 Socioeconomic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions in the regions where the Asset is located and the country as a whole. These include:

1. Changes in factors such as population, economic growth (regional and national) and industrial production; and
2. Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available. In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

National Level

4.3 Table 4-1 below shows that the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4-1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4-1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.4 Table 4-2 below shows the evolution of population in the states of Uttar Pradesh and Delhi (containing the Asset), compared to that of the country.

4.5 As Table 4-2 shows, the populations of both Uttar Pradesh and Delhi have grown at a faster pace compared to that of India, between FY12 and FY24. As of FY24, Uttar Pradesh holds an 8.1% share in India's population, while Delhi has a 1.5% share.

Table 4-2: Population Growth in Uttar Pradesh, Delhi and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Uttar Pradesh	201.5	237.0	1.4%
Delhi	17.0	21.6	2.0%
India	1,210	1,395	1.2%

Source: Ministry of Statistics and Program Implementation estimates

4.6 Due to the complexities of patterns of urbanisation, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

Economic Indicators

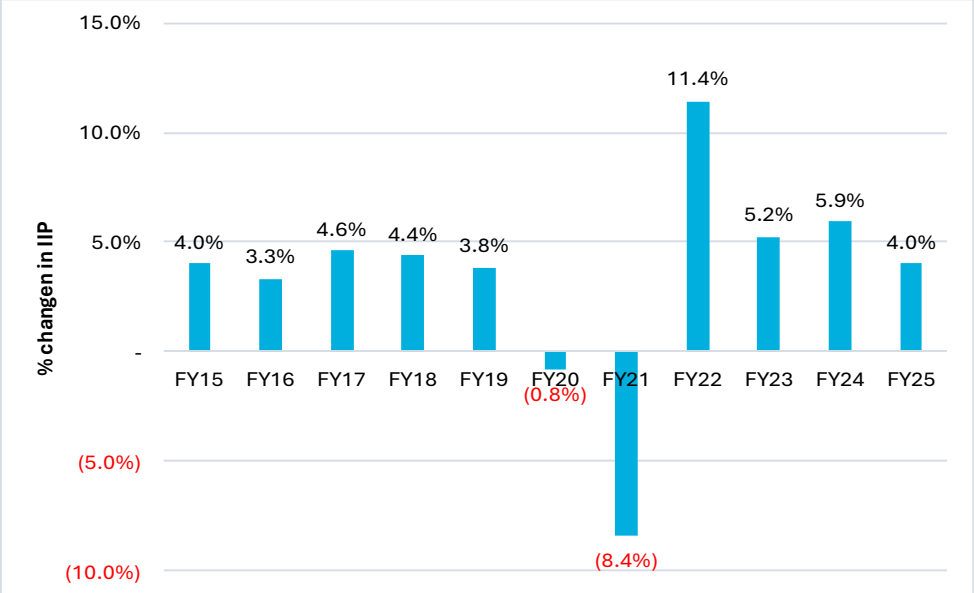
Industrial Production

4.7 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.8 Figure 4.1 shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4%, and FY26YTD (till February 2026) recording 3.3% growth over FY25.

4.9 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. However, we do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Figure 4.1: Annual growth – Index of Industrial Production



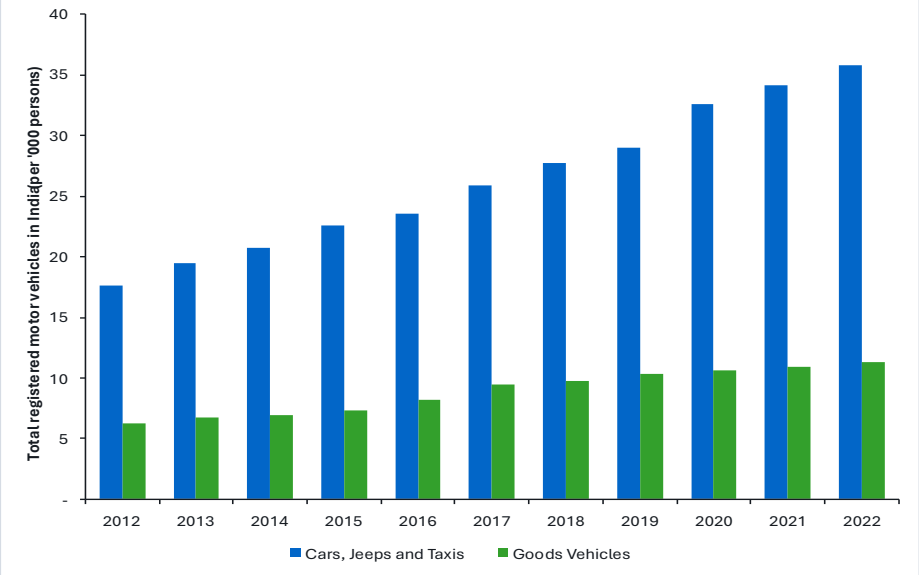
Source: Steer Analysis of MoSPI data

Vehicle ownership

4.10 The gap in car ownership between India and developed nations remains substantial – with 36 cars/jeeps/taxis and 11 commercial vehicles per thousand people, as of FY22 (the latest year for which official data is available). However, with increasing per capita income levels, a booming economy and the subsequent increase in demand for mobility, the number of registered vehicles has been on a gradual upward trend

4.11 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. Between FY12 and FY22, the CAGR for CJV and goods' vehicles registered in India was 8.6% and 7.3% respectively

Figure 4.2: Car Ownership in India per 1,000 population



Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.12 The Asset lies in Uttar Pradesh and Delhi. As shown in Figure 4.3 below, the per capita income of Uttar Pradesh is lower as compared to that of India - it has historically been at roughly 40-50% of the national average since FY15 through present day. On the other hand, the per capita income of Delhi has consistently been higher than that of India – it was 2.5 times higher than the national average, as of FY25.

4.13 Traffic on the Asset is influenced by both Delhi and Uttar Pradesh – specifically, the western region of UP, which has grown at a faster rate than the rest of the state in recent years and is expected to continue this trajectory. The higher per capita income of Delhi and the higher growth in western UP indicates sustained economic growth in the region, driving traffic growth on the Asset over time.

Figure 4.3: Relative Per Capita Income (FY15-FY25)

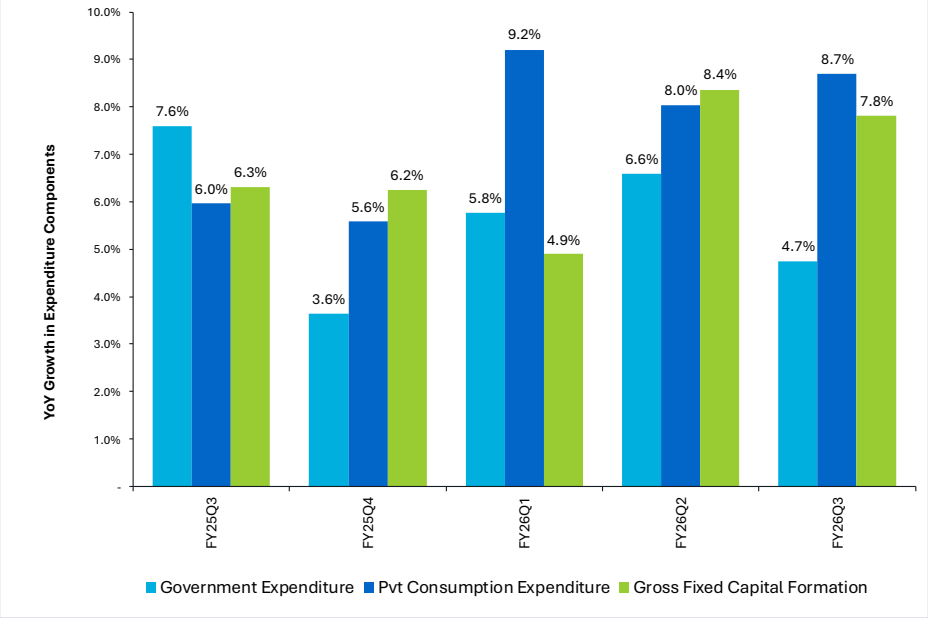
Economic Growth

India's Performance

Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q3 GDP at 7.8% over FY25Q3. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead .

The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past year (FY25Q3-FY26Q3).

Figure 4.4: YoY Growth in Government, Consumption and Business Expenditures

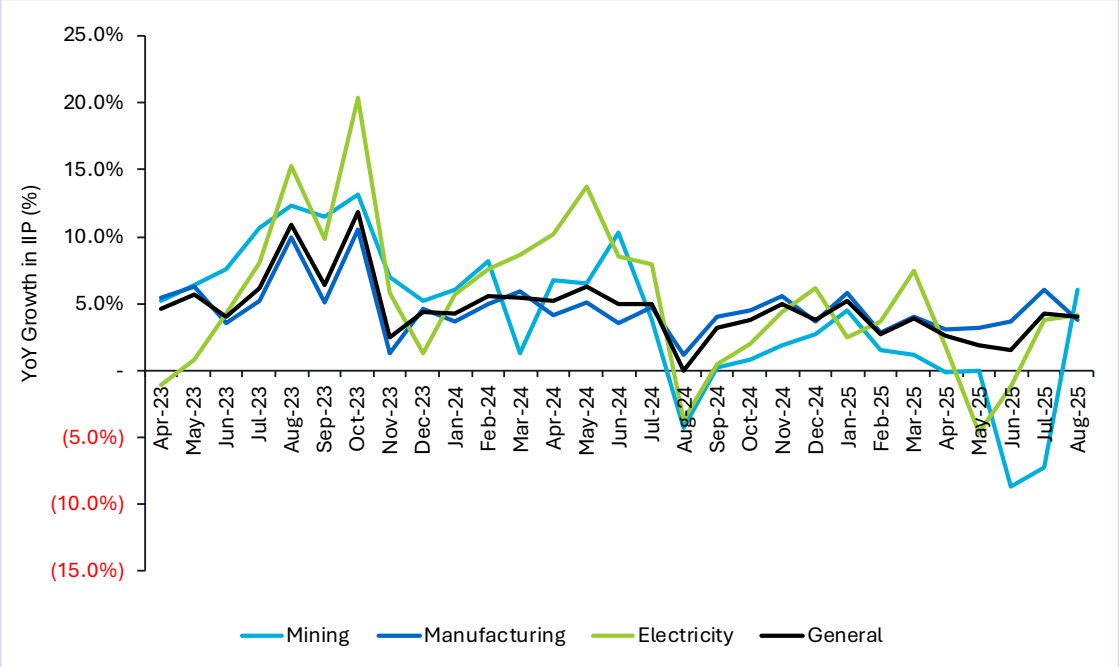


Source: Steer Analysis of MOSPI Data

While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 5.8% growth over FY25Q1 levels.

4.14 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr'25-Feb '26), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

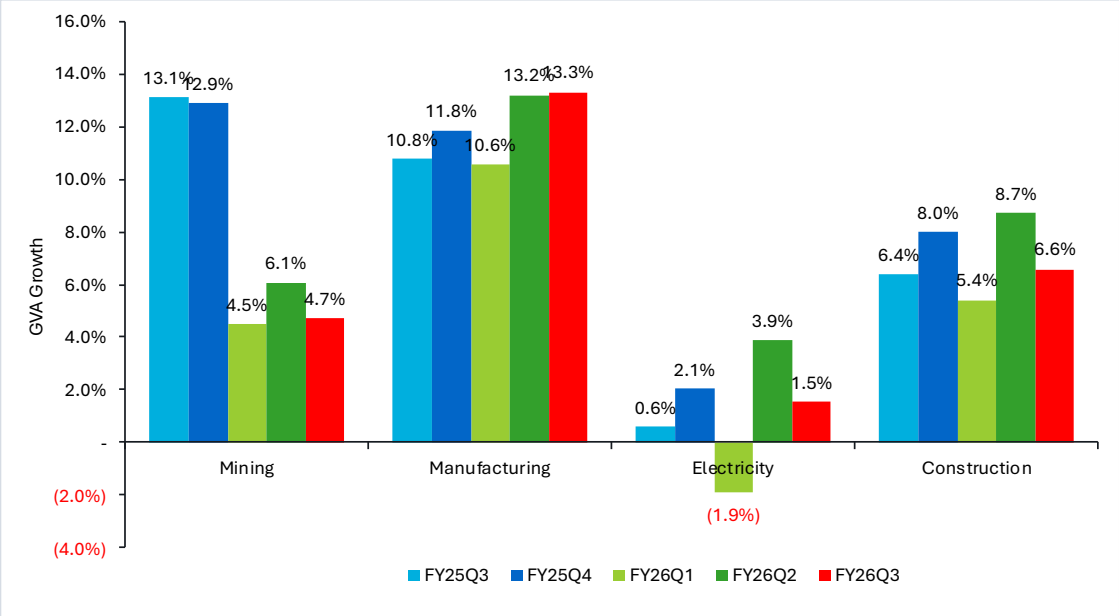
Figure 4.5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.15 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4.6: Industrial components of GVA



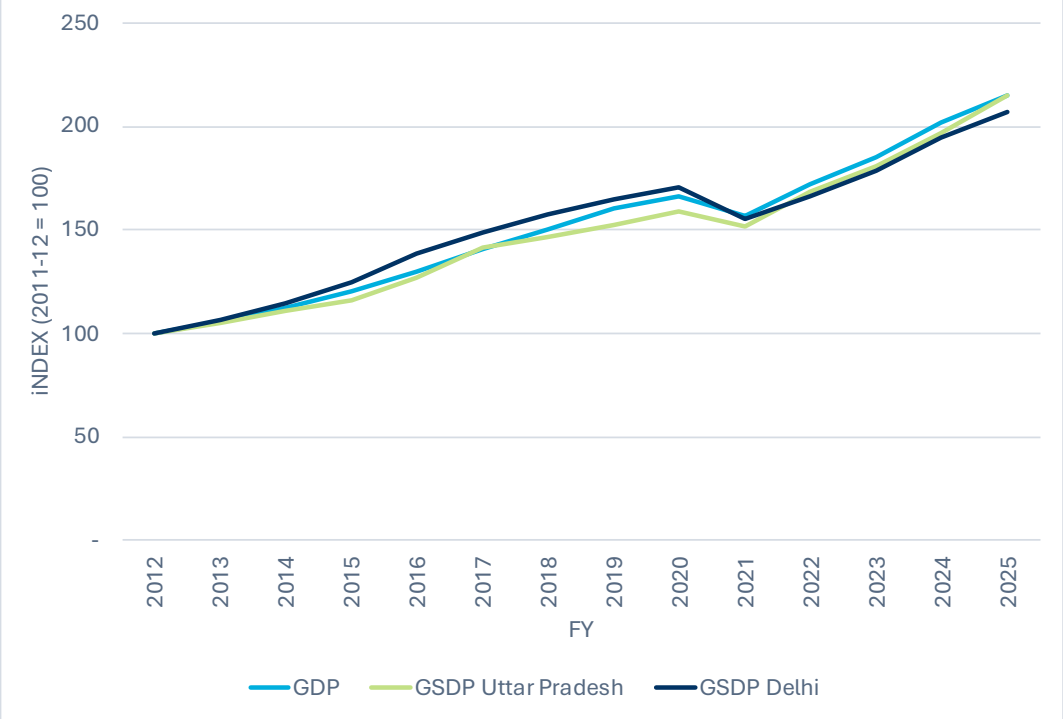
Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.16 Figure 4.7 below presents historical growth in Delhi and Uttar Pradesh GSDP, and the GDP of India. Between the period of FY12 and FY25, the Indian economy grew at a CAGR of 6.1% per year – aided by strong growth in the services/tertiary sector, which grew at a CAGR of 6.9%per year over the same period. UP GSDP and Delhi GSDP grew at 6.1% and 5.8% per year (respectively) between FY12 and FY25 – in step with the national economy.

4.17 As shown in Table 4-2 above, Delhi and UP respectively accounted for 1.5% and 17% of national population in FY24. In terms of national economic contribution, Delhi and Uttar Pradesh contributed approximately 4% and 8% respectively to India's GDP in FY24. Therefore, Delhi's per capita GDP contribution in FY24 far exceeded the same for UP statewide, highlighting the importance of the region in driving consumption demand and regional traffic growth near the Asset.

Figure 4.7: Evolution of Delhi's and Uttar Pradesh's state GDP and national GDP



Source: Steer Analysis of MoSPI data

Economic activity in the state

Uttar Pradesh

4.18 Uttar Pradesh is the most populous state in India with a population of ~237 million people (as of FY24). The state has a large pool of skilled, semi-skilled and unskilled labour. A shown in Figure 4.8 below, the tertiary sector has the highest sectoral contribution (49%) to the state GSVA followed by the secondary (28%) and primary (23%) sectors, as of FY25.

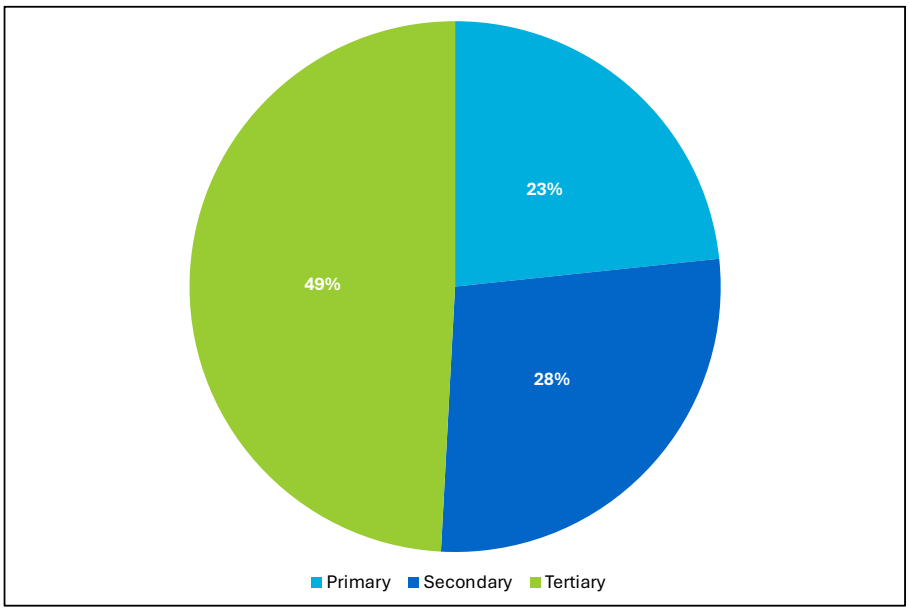
4.19 Uttar Pradesh is considered one of the primary tourist destinations in India, with key tourist attractions being Agra, Varanasi, Mathura and Prayagraj. The state recorded a

tourist footfall of 64.9 crore in 2024, a significant increase of over 17 crore compared to 2023, as per Union Ministry of Tourism[19]

4.20 In terms of secondary sector, the state has key industrial areas in Khurja (Ceramic); Moradabad (Metals); Meerut, Bareilly, Mirzapur and Lucknow (Handloom & Handicrafts); and Kanpur and Noida (Leather and tannery). The state also has an oil refinery in Mathura, operated by the Indian Oil Corporation (IOCL).

4.21 Uttar Pradesh has very fertile Gangetic land with a large share of population dependent upon agriculture for the livelihood. The state is mainly known for production of wheat, sugarcane, potato and mango. As of FY25, the state contributes approximately 13% to India's GVA in terms of the 'Agriculture, forestry and fishing' sub-sector

Figure 4.8: Sectoral contribution to Uttar Pradesh's GSDP as of FY25



Source: Steer Analysis of MoSPI data

Western UP vs UP GSDP Growth

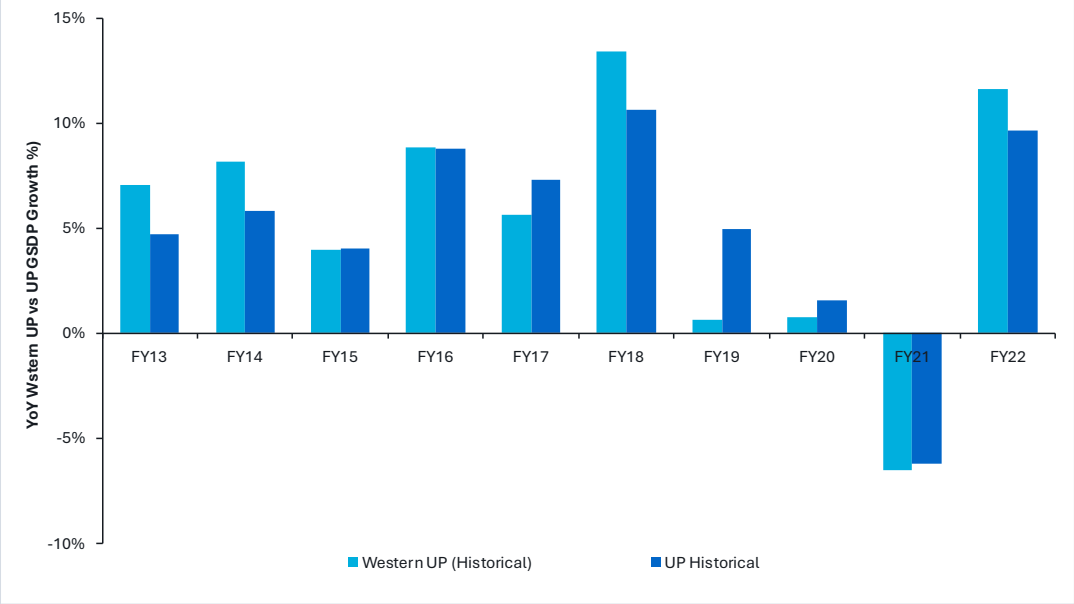
4.22 Since FY13, growth of Western UP GSDP[20] has remained relatively stable, and in line with UP statewide GSDP growth. In Figure 4.9 below, we see that between FY13 and FY22, GSDP growth in Western UP exceeded that of UP overall in 5 of the 10 years (FY13, FY14, FY18, FY21 and FY22), was consistent with UP in 2 of the 10 years (FY15 and FY16), and was below UP GSDP growth in 3 of the 10 years (FY17, FY19 and FY20). While UP statewide growth is largely influenced by Western UP, in recent years (FY21-22), Western UP GSDP has exhibited growth more sensitive than statewide trends.[21]

[19] up-sees-65-crore-tourists-in-2024-over-17-crore-more-from-2023

[20] The Western UP region consists of 30 districts, prominent among which are Ghaziabad, Gautam Budh Nagar, Agra, Meerut, Mathura and Bareilly. Historically, this collective region has been the more economically developed part of Uttar Pradesh, and as of FY22 accounted for half of the statewide total GSDP.

[21] Steer analysis of data sourced from the Directorate of Economics and Statistics, Uttar Pradesh (**UPDES website**)

Figure 4.9: Western UP vs UP GSDP Growth



Source: Directorate of Economics and Statistics, Uttar Pradesh

4.23 This can be explained due to a combination of policy- and market-driven factors which have contributed to higher growth in the Western region of the state in recent years. Some of these major developments pertaining to large-scale infrastructure investments in the region include:

- Delhi – Meerut Expressway[22]
- Ganga Expressway [23]
- Noida International Airport (Jewar Airport) [24]
- Logistics hub in Agra, by the Agra Development Authority [25]
- 'New Noida' initiative by the Uttar Pradesh government [26]

4.24 Between FY12–FY25, the GSDP of Uttar Pradesh grew at a CAGR of 6.1% per year. Over the same period, national GDP grew at 6.1%[27] per year, implying that the long-term elasticity factor of UP GSDP growth to national GDP growth is roughly 1. In this context, since Western UP has exhibited more elastic growth relative to UP state overall in recent years, and expectations of strong near-term growth in the Western UP region remain, we have assumed the near-term growth forecast for Western UP to be similarly elastic to

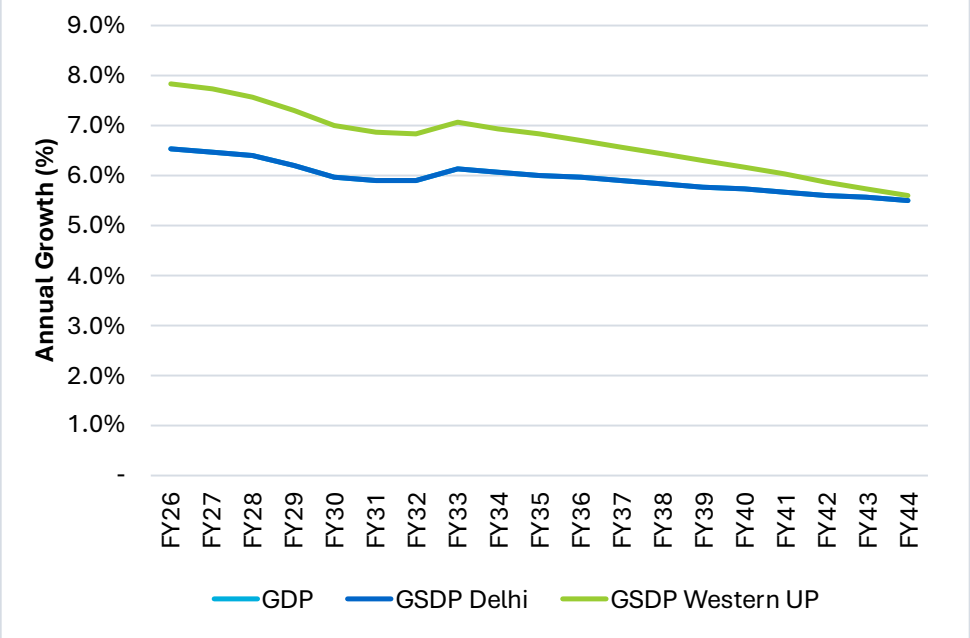
India's GDP growth forecast (as it has been with respect to UP statewide GSDP growth in recent years).

4.25 Figure 4.10 below presents the Client-provided forecasts of national (India) GDP growth from FY26 to FY44, and our assumed GSDP forecast for Western Uttar Pradesh over the same period. In the short term, we have assumed GSDP of Western UP to grow at 1.2 times that of national GDP growth forecast, eventually tapering down to a factor of 1.00 over time as it converges to the national growth rate forecast by FY44.

Figure 4.10: GSDP Western UP vs GDP India Forecast



Source: Steer Analysis

Delhi

4.26 Delhi, the capital city of India, is one of the largest metropolises in the country. In terms of the GSVA composition of Delhi, as shown in Figure 4.11, the tertiary sector has the highest share (86%) followed by the secondary sector (13%) as of FY25.

4.27 The biggest contributors to the tertiary sector in Delhi are tourism, trade, financial services and real estate. Owing to its location, connectivity and rich cultural history, Delhi has always been a prime tourist attraction of the country with key tourist places being India Gate, Lotus Temple, Humayun's Tomb and Akshardham. The Indira Gandhi International Airport of Delhi serves both domestic and international passengers and as of 2024, it was the tenth-busiest airport in the world[28], catering to approximately 72.2 million passengers.

4.28 In terms of secondary sector, the region has key industrial clusters at Narela, Naraina, Okhla and Mayapuri. The primary/agricultural sector accounts for a small share of Delhi's GSVA.

Forecasts for growth drivers

4.29 Following the discussion in Chapter 4 on the nature of economic activity in the state of Western Uttar Pradesh and in Delhi, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.30 We have based our forecasts of the GSDPs for Western Uttar Pradesh and Delhi based on the forecasts of the GDP of India as provided by the client.

National GDP

4.31 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption[29].

4.32 The Covid-19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23 and 9.2% in FY24, before showing signs of slowdown again in FY25 due to several domestic and external

[29] Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu (September 2020)

factors. Since H2FY25, the economy has shown strong growth, driven by improved consumer optimism, and growing consumption and investment demand.

4.33 Figure 4.12 below shows the Client-provided GDP projections for India. The forecast projects the GDP of India to grow at an average of 6.3% between FY26-FY30 and 5.8% between FY31-FY44, gradually tapering down to 5.2% by FY50. The GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[30] in the medium term.

4.34 We assume the GSDP growth of Delhi to be in line with India's GDP growth throughout the concession period. For our forecast of the GSDP growth of Uttar Pradesh, we have considered the growth expectations for the western region of UP – as opposed to UP state-wide, due to the location of the Asset in the western region of UP. Additionally, we have assumed the GSDP growth of western UP to higher than that of the GDP of India going forward, across the concession period.

4.35 In particular, we expect it to grow at 1.2 times the GDP of India in the short-term, tapering down to be in line with national GDP growth by FY44. This assumption is based on the recent performance of the GSDP of western UP relative to statewide GSDP growth (as discussed in detail in 4.22 above), as well as expectations of continued investment and economic growth in the region owing to a variety of factors

4.36 There are significant investments expected to take place as part of the Delhi and Uttar Pradesh state/regional government plans over the near to medium term (as described in 4.23 above). Given its leading position in industrial investments, western UP is expected to benefit significantly from these future investment plans. In this context, we believe it is reasonable to assume that Western UP will observe more robust economic growth over the near and medium term relative to UP state overall, and by extension, relative to national GDP growth as well.

4.37 Figure 4.12 below shows the assumed growth forecasts for Western UP and Delhi GSDP, and the GDP of India.

5 FY26 Base year AADT and Traffic growth analysis

Introduction

5.1 In this chapter, we present our approach, assumptions, and results for baseline (or background) traffic growth for each vehicle category on the Asset. Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.2 In the absence of long-term historical data on KM46 (Gadpuri) and KM94 (Karman) toll plazas, the option of running statistical models to estimate background growth relationships was not possible for these two plazas, and therefore we have undertaken a detailed benchmarking exercise, coupled with trip length and OD analysis to estimate the traffic growth elasticities for these two plazas. While regression analysis was conducted for KM164 (Mahuvan), the final growth elasticities used to forecast traffic growth at the plazas were also based on benchmarking analysis from other comparable assets and studies conducted by Steer. The estimated elasticities helped inform our final assumptions for use in the forecasting models. These are discussed in detail below.

5.3 Typically, passenger and light commercial vehicle traffic like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state in which the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because the majority of light vehicles tend to travel shorter distances within the state, whereas a significant proportion of heavy vehicles carry commodities for long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for the forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our contextual knowledge, to assess demand on the corridor.

Methodology

5.6 The base traffic for FY26 has been estimated using 11 months of actual traffic data (April to February). Each toll plaza's seasonality correction factors were applied on the actual MADTs of Apr-25 to Feb-26 to obtain seasonally corrected estimates for FY26 traffic. An average of these estimates was considered to be the FY26 base traffic.

Seasonality Correction factors

5.7 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.8 In order to normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.9 Therefore, we studied the monthly seasonality of traffic on the Asset by analysing the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling (excluding years impacted by non-normal events e.g. FY21 COVID). The averaged seasonality trend is then applied to the monthly traffic to obtain our FY26 Base AADT.

5.10 Table 5-1 through Table 5-3 below present the SCFs used for the estimation of the FY26 base year AADT at KM46 (Gadpuri), KM94 (Karman) and KM164 (Mahuvan) toll plazas.

Source: Steer analysis. FY26YTD includes 11 months of FY26 (Apr-Feb '26), FY26A is adopted base for FY26; 1 PCU totals above consider PCU factor of ~3.60 for 3A/MAV combined traffic.

Table 5-6: Adopted base estimates: KM164 Mahuvan

Vehicle Type	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	15,281	16,817	17,035	**11.5%**
LCV	1,485	1,545	1,556	**4.8%**
Bus	1,032	1,112	1,126	**9.1%**
2A	3,807	3,995	4,022	**5.6%**
3A/MAV	6,483	6,434	6,460	**(0.4%)**
OSV	3	3	0	**-**
Total	**28,091**	**29,907**	**30,200**	**7.5%**
PCU[1]	**55,113**	**57,372**	**57,807**	**4.9%**

Source: Steer analysis. FY26YTD includes 11 months of FY26 (Apr- Feb '26); 1 PCU totals above consider PCU factor of ~3.60 for 3A/MAV combined traffic.

5.12 Except for 3A/MAV, all other vehicle categories have exhibited strong growth in FY26YTD over FY25. 3A/MAV volumes across the NH44 corridor continue to be impacted by the access provided by the DME (primarily) in addition to other network changes that have and continue to divert traffic away from the Asset -most significantly at km46 (Gadpuri). Our base estimates for FY26 reflect the assumption that traffic performance for the remainder of the year will broadly continue the trend observed through FY26YTD i.e., Apr-Feb '26. At a PCU level, KM46 is estimated to grow at 4.3%, while KM94 and KM164 are estimated to grow at 5.8% and 4.9% (respectively) over FY25. PCU growth across the Asset is primarily driven by the CJV category, which carries the highest weighting among all vehicle classes. Additionally, 2-Axle vehicles have recorded strong growth at Karman and Mahuvan toll plazas, reflecting a gradual adoption of containerised 2-axle trucks for ecommerce traffic and other high value low volume cargo.

5.13 The lower growth at KM46 Gadpuri stems from the shift of short-distance traffic (between Faridabad/Delhi and southwestern Haryana and Rajasthan) to 148NA which earlier used to appear at KM46. The Faridabad bypass (148NA) connecting to DME and KMP has continued to impact commercial traffic growth on the Asset with both 2A and 3A/MAV volumes observing declines on KM46 due to the direct access to the DME. Given the more long-distance nature of commercial volumes on KM94 and KM164, 2A trucks on both the plazas recorded strong growth as of FY26YTD. 3A/MAV volumes however showed some decline across both the plazas. Our FY26A Base AADT estimates incorporate these differences in growth trends across the three plazas.

5.14 CJV traffic is projected to grow by approximately 7.9%, 11.4%, and 11.6% at Gadpuri, Karman, and Mahuvan toll plazas, respectively, between FY25 and FY26A at the Asset level. This growth is primarily driven by expanding urban clusters such as Delhi NCR, Agra, Mathura, and Faridabad. These regions are expected to witness increasing urban density and sustained economic growth, with travel demand related to employment, education, and medical purposes continuing to support traffic growth across the Asset.

5.15 A common trend observed across the Asset is the flatlining of 3A/MAV growth in FY26A:

- **Preference shift from 3As to 2A's, MAVs**: As discussed in detail in Section 3.13, the 3A performance over the last three years has been muted. While this Asset does not report 3A trucks separately, evidence from other Assets in the region (based on Steer studies) suggest that 3As have either declined or shown little y-o-y growth since FY22.

- **Shift of medium distance movements to Delhi Mumbai Expressway**: While the full impact of the DME has not yet materialised on KM164 and KM94, a share of short/medium distance movement till Jaipur, Indore have seen a diversion towards the expressway.
- **Shift of Kanpur bound movement to Ghaziabad/Palwal – Aligarh – Kanpur**: Recent upgradation of the Ghaziabad-Aligarh-Kanpur sections have improved the overall LoS of the alternate route for traffic bound to/originating in Kanpur/Lucknow and beyond. This share of traffic earlier used to appear on the Asset but has now started to prefer the alternate route.

Estimation of background elasticities

5.16 Traffic growth elasticities measure the relationship between traffic growth on the Asset and growth in the underlying macroeconomic and regional economic drivers that influence traffic growth on the Asset. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide forecasts of background traffic growth rates.

5.17 The Asset observes CJVs making shorter trips across all the three toll plazas, whereas the commercial traffic trends vis a vis the trip lengths differ from plaza to plaza. These differences can be attributed to the changing proximity of each of the toll plazas to urban centres in the region. These observations have been validated by the results of the OD analysis as well, which show a greater percentage of I-I trips for passenger vehicles, and a growing share of E-E trips for commercial vehicles as we move from KM46 (nearest to Delhi NCR) down to KM164 (nearest to Agra).

5.18 As a result, growth drivers for each vehicle category were selected based on these traffic profiles and trip patterns observed across all three toll plazas (from the OD survey analysis of the two toll plazas from February 2026 and from prior OD surveys conducted on KM94 in prior studies). Table 5-7 below presents the growth drivers identified to model the forecast background traffic growth rates for each vehicle category at all three plazas.

Table 5-7: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP Western Uttar Pradesh	GSDP Delhi
Car		25% - KM46 Gadpuri 50% - KM74 Karman and KM164 Mahuvan	75% - KM46 Gadpuri 50% - KM74 Karman and KM164 Mahuvan
LCV		50%	50%
Bus		50%	50%
2A	100%		
3A	100%		
MAV	100%		

Source: Steer analysis of Client data

5.19 The recent historical period of tolling is chequered with variations in traffic growth between years for certain vehicle types. As discussed in detail in Chapter 2 and 3, the Asset has seen several network and regulatory related impacts affecting traffic growth over the years, such as:

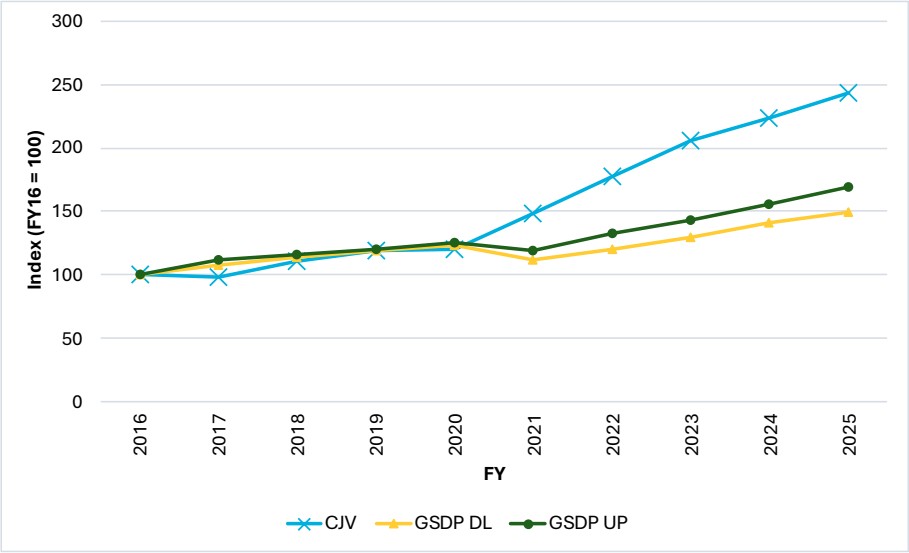
- The splitting of the KM74 toll plaza in FY23 resulted in a change in traffic profiles observed at the two new plazas (relative to the prior plaza). Traffic profiles and trip patterns observed at KM164 have remained more stable since it was not affected by the splitting KM74 in FY23.
- Due to the partial commissioning of Delhi-Mumbai Expressway (DME), we have seen further variations in traffic as different sections of it have gotten operational.

5.20 In our regression analysis for KM164, we have used combined traffic for specific toll/vehicle categories as data for historical years were available only in combined form for those categories (e.g., 3A/MAV), or to estimate more stable models as mandatory FASTag implementation since FY22 resulted in large variations in certain vehicle categories (traffic volumes were redistributed into different vehicle types e.g. Bus/2A).

CJV

5.21 We see from the OD data that the CJVs primarily cater to regional movements between NCR, Faridabad, Mathura/Vrindavan, Agra and other towns lying on the Asset. Apart from the local and IAOI influence seen from towns and cities in Uttar Pradesh, we also observed a considerable influence from Central NCR and Faridabad. We have therefore taken a 50:50 combined GSDP growth of Western UP and Delhi to be the growth driver to model the growth of CJV traffic. Historically, the CJV traffic at Mahuvan toll plaza observed a healthy CAGR of 10% per year between FY16 and FY25, while the GSDP of Delhi and Uttar Pradesh grew by 5% and 6% (respectively) over the same period. Figure 5.1 below shows the relationship between indexed values of CJV traffic at KM164 (Mahuvan) and Western UP/Delhi GSDP.

Figure 5.1: Relationship between CJV traffic and Uttar Pradesh/Delhi GSDP (KM164 Mahuvan)



Source: Steer analysis of Client TMS data and publicly available GSDP data

5.22 Considering the robust growth in CJV traffic observed over the operational historical period with trips largely seen between urban areas in and around the Asset, we have assumed a forecast background elasticity of 1.20 at KM94 (Karman) and KM164 (Mahuvan), with respect to the GSDPs of Delhi and Western Uttar Pradesh. This elasticity is tapered down to 1.10 by FY35 at both KM94 and KM164. At KM46 (Gadpuri), we have assigned an elasticity of 1.10 which dampens to 1.0 by FY35. This is in line with

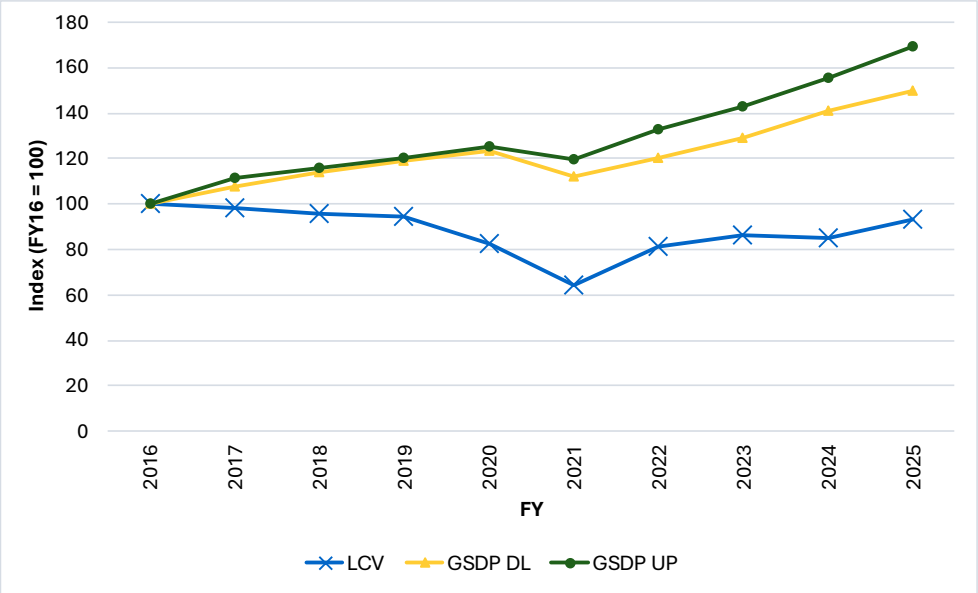
benchmarks we have observed at other toll roads across the country, which have a considerable concentration of inter-urban areas along their alignment.

LCV, Bus and 2A

LCV

5.23 As noted in the OD analysis above, LCVs have more regional movements within the state - UP and Delhi in the case of the Asset- than heavier vehicles like 3As and MAVs. As a result, we used Western UP/Delhi GSDP growth as the growth driver to predict LCV traffic growth going forward. However, after FY20, the axle load regulations switched in favour of 2A to carry higher tonnage which has influenced the LCV volumes observed on the Asset. As a result, we see a downward trend in LCV relative to GSDP. Figure 5.2 below depicts the link between indexed values of LCV traffic observed at KM164 (Mahuvan) and Western UP/Delhi GSDP.

Figure 5.2: Relationship between LCV traffic and Uttar Pradesh/Delhi GSDP (KM164 Mahuvan)



Source: Steer analysis of Client TMS data and publicly available GSDP data

5.24 Based on the above observations and our experience across other toll roads in the country, we conclude that LCV will continue to grow at a modest elasticity of 0.30 to Western UP/Delhi GSDP growth. This is consistent across all three toll plazas on the Asset.

Bus & 2A

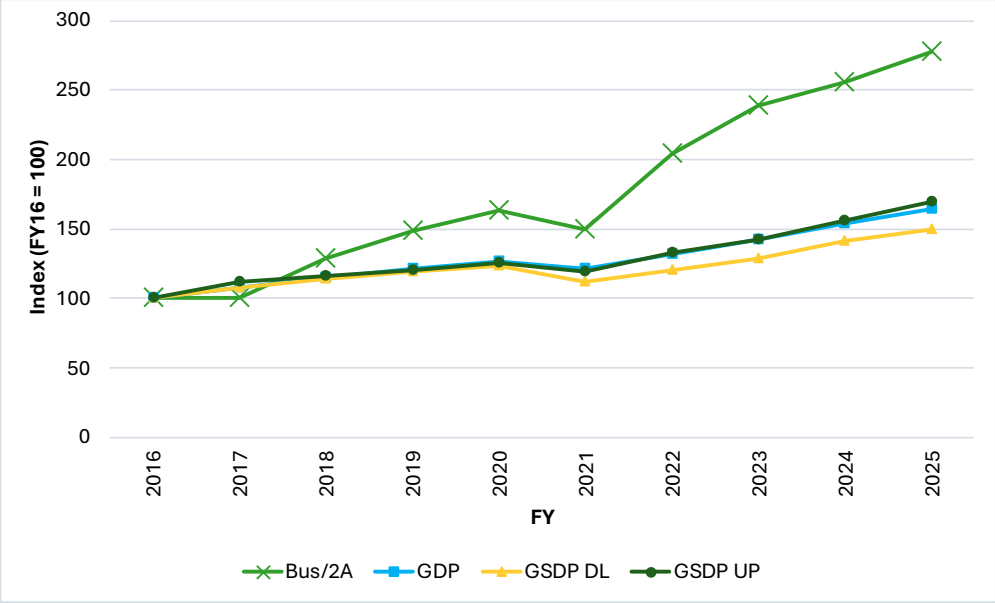
5.25 Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government at different intervals of time. Based on our experience across the country, buses on inter-urban corridors show moderate elasticities of 0.4 to 0.6 with respect to the regional/state GSDP in which the asset is located.

5.26 The Bus/2A category at KM164 (Mahuvan) has recorded steady growth since FY18, with combined Bus/2A volumes registering a CAGR of approximately 12% between FY18 and FY25. In the post-COVID period, Bus+2A volumes have grown at a CAGR of around 8% per annum between FY23 and FY25 at this toll plaza.

5.27 However, analysis of historical trends and benchmarking against assets with characteristics comparable to DATL indicates that this growth has been driven largely by the 2-Axle (2A) segment, while Bus volumes have exhibited a comparatively muted growth profile over the same period. Accordingly, we have assumed a relatively conservative elasticity of 0.50 for Buses (with respect to Western UP/Delhi GSDP) at the Karman and Mahuvan toll plazas, and a slightly higher elasticity of 0.60 at Gadpuri.

5.28 For the 2A category, a higher elasticity of 0.90 has been assumed across Karman and Mahuvan toll plazas, reflecting stronger underlying growth fundamentals. However, at Gadpuri toll plaza, we have adopted a more conservative elasticity, assuming a lower initial elasticity of 0.70, tapering gradually to 0.65 by FY35. This reflects the relatively weaker growth outlook for 2As at Gadpuri, driven by the opening of NH-148NA and the continued diversion of traffic towards the Delhi-Mumbai Expressway.

Figure 5.3: Relationship between Bus/2A traffic with GSDP Delhi, GSDP UP and GDP (KM164 Mahuvan)



Source: Steer analysis of Client TMS data and publicly available GSDP data

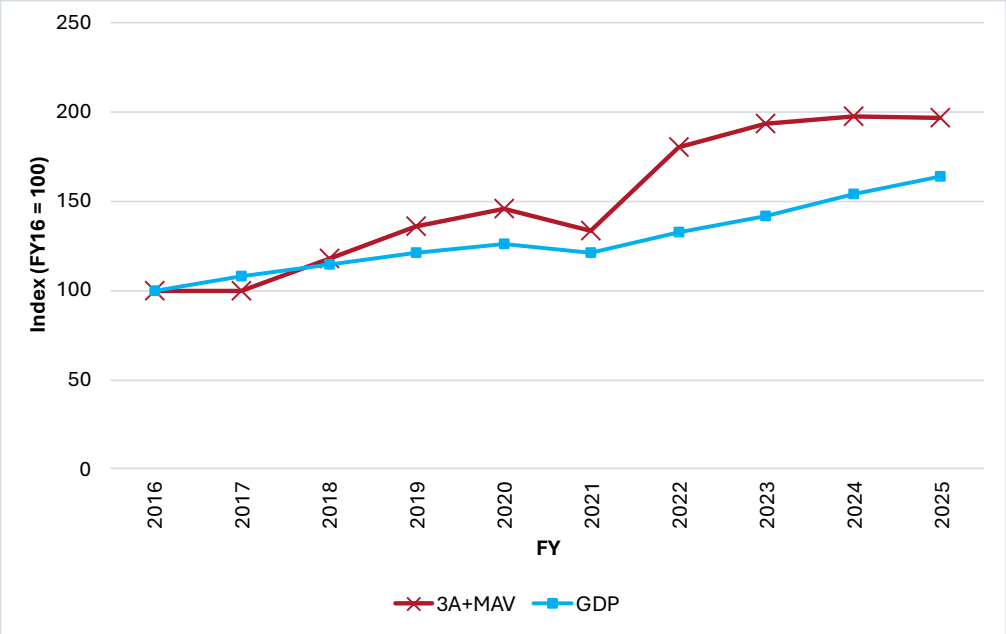
3A/MAV Trucks

5.29 Compared to lighter trucks like LCVs and 2As, 3As and MAVs have more national or long-distance movements covering several states. Given that manufacturing-related commodities tend to take prominence in their commodity distribution, growth in 3A and MAV traffic is dependent on industry demand-supply ecosystems spread across the country. Thus, we have taken GDP as the growth driver to model the traffic growth in 3A and MAVs on the Asset. Figure 5.4 below shows the relationship between indexed values of 3A+MAV traffic at KM164 (Mahuvan) and national GDP over the period FY16-25.

5.30 Historically, 3A+MAV combined traffic has observed robust growth from FY18 onwards. From FY18 to FY25, the combined traffic grew at an 8% CAGR on Mahuvan TP. This growth has been observed due to network-related improvements and continued economic growth in the region within the vicinity of the Asset e.g., Delhi NCR. Over the same period, national GDP grew at a CAGR of 5% per year while UP GSDP grew at a CAGR of 6% per year. Thus 3A/MAV growth at KM164 appears to have shown stronger growth relative to

the growth observed in both the state GSDP and India GDP, highlighting the importance of this corridor in facilitating long-distance commercial movements across the country.

Figure 5.4: Relationship between 3A+MAV combined traffic and India's GDP (KM164 Mahuvan)



Source: Steer analysis of Client TMS data and publicly available GDP

5.31 Based on the results of the regression analysis for KM164 (Mahuvan), insights from the OD analyses presented in Chapter 3 - particularly relating to trip length patterns and commodity distributions - and the Asset's historical growth performance relative to comparable corridors, we have adopted conservative elasticity assumptions for the 3A category. Specifically, an elasticity of 0.20 (with respect to national GDP) has been assumed for 3As at the Karman and Mahuvan toll plazas, while a lower elasticity of 0.10 has been applied at Gadpuri.

5.32 The lower elasticity assumed for 3As at Gadpuri reflects the sustained negative growth observed at this plaza for the category, driven by significant network developments, including the opening of NH-148NA and the operationalisation of the Delhi–Mumbai Expressway, which have continued to divert freight traffic away from the corridor.

5.33 For MAVs, an elasticity of 1.10 has been assumed at KM94 (Karman) and KM164 (Mahuvan), reflecting stronger underlying demand and longer-haul freight characteristics at these locations. In contrast, a lower elasticity of 0.90 has been assumed at KM46 (Gadpuri), consistent with the continued diversion relative underperformance of the 3A/MAV category at this toll plaza.

Forecasts for background elasticities

5.34 Table 5-8 below presents a summary of the results of the regression analysis carried out on the historical toll plaza data for KM164 (Mahuvan) and the various macroeconomic (GDP/GDSP) drivers assumed to influence traffic growth on the Asset, along with the assumed forecast elasticities we used to forecast background traffic growth on the Asset.

5.35 The forecast elasticities are projected to remain constant over the majority of the concession period, with gradual tapering down over the long-term for specific plaza-vehicle category combinations. This assumption is grounded in historical trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away.

5.36 The 6-lane configuration on NH corridors is designed to handle up to 120,000 PCUs. Once the Asset exceeds its 6-lane designed capacity, we anticipate that the year-over-year growth of the Asset will be constrained due to growing congestion and declining Level of Service (LoS).

5.37 From our projections, the Asset is expected to reach its design capacity of 120,000 daily PCUs in FY41 (average across all three plazas). As the traffic levels on the Asset get closer to this level, the increasing congestion and deterioration in the level of service (LoS) results in a slowdown of growth as the prospective users look for alternative routes and a proportion of them shift towards the alternatives.. Our elasticity recommendations are presented in Table 5-8 below.

Table 5-8: Derived elasticities from regression analysis and assumed forecast elasticities

Vehicle Type	Growth Driver	History		Forecast	
		Derived elasticity	Period considered	Assumed forecast elasticity	Evolution of elasticity
KM164 Mahuvan					
Car	GSDP Western Uttar Pradesh/Delhi	1.27	FY16-FY24	1.20	Decreasing to 1.1 by FY35
LCV	GSDP Western Uttar Pradesh/Delhi	N/A	FY16-FY24	0.30	No change
(Bus + 2A)*	GSDP Western Uttar Pradesh/Delhi	2.13	FY16-FY24	0.50	No Change
2A	GDP			1.00	Decreasing to 0.90 by FY35
(3A + MAV)*	GDP	1.13	FY16-FY25	0.20	No change
				1.10	Decreasing to 1.00 by FY35
KM46 Gadpuri					
Car	GSDP Western Uttar Pradesh/Delhi	-	-	1.10	Decreasing to 1.0 by FY35
LCV*	GSDP Western Uttar Pradesh/Delhi	-	-	0.30	No change
Bus	GSDP Western Uttar Pradesh/Delhi	-	-	0.60	No Change

Vehicle Type	Growth Driver	History		Forecast	
		Derived elasticity	Period considered	Assumed forecast elasticity	Evolution of elasticity
2A*	GDP	-	-	0.70	Decreasing to 0.65 by FY35
3A	GDP	-	-	0.10	No change
MAV	GDP	-	-	0.90	No Change
KM94 Karman					
Car	GSDP Western Uttar Pradesh/Delhi	-	-	1.20	Decreasing to 1.1 by FY35
LCV*	GSDP Western Uttar Pradesh/Delhi	-	-	0.30	No change
Bus	GSDP Western Uttar Pradesh/Delhi	-	-	0.50	No Change
2A*	GDP	-	-	1.00	Decreasing to 0.90 by FY35
3A	GDP	-	-	0.20	No change
MAV	GDP	-	-	1.10	Decreasing to 1.00 by FY35

Source: Steer analysis; *regressions were run on Bus+2A and 3A+MAV aggregated volumes and elasticities estimated reflect the relationship of growth in the aggregated volumes w.r.t the underlying driver. However, our forecast models assume separate elasticities for each of the vehicle categories w.r.t to the underlying driver variables; Bus + 2A model was run on Western UP/Delhi GSDP variable rather than India GDP, but forecasts assume that 2A traffic is driven by GDP growth

6 Forecast: Network overlays and forecasts

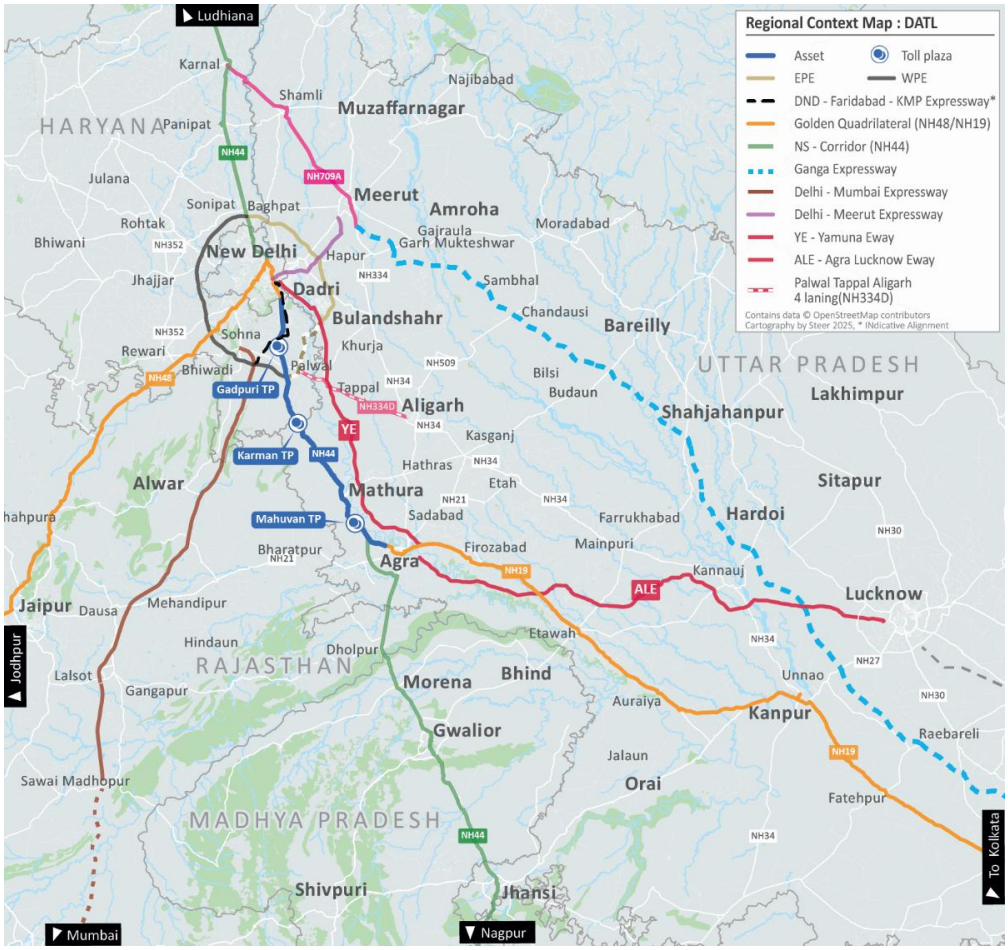
Introduction

6.1 Following the discussion on estimated and assumed forecast background growth rates in the previous chapter, this chapter first deals with the forecasting assumptions around base year AADT and potential impacts on traffic growth on the Asset. Later, it also presents the assumed toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to estimate the forecasted revenue based on the forecasted traffic. In the final section, the chapter summarises the traffic growth rates for the forecast years.

Analysis of potential impacts

6.2 Figure 6.1 below shows a map of the regional transportation road network surrounding the Asset, along with various key feeder and competing routes in the region.

Figure 6.1: Alternate routes and Asset route shown against the regional network context



Source: Steer analysis and cartography

Alternate routes and improvements

6.3 Table 6-1 below presents the upcoming network/other developments, corresponding alternate/feeder routes, year of completion and indicative direction of impact on the Asset. To assess these types of future impacts on the Asset, whether they be positive or negative, we have studied developments (alternate roads, feeder roads and regulatory changes) that are relevant to the Asset within the context of its surrounding road network.

6.4 Apart from the Delhi-Mumbai Expressway becoming fully operational by FY27[31], other major network developments that could potentially have an impact on future traffic growth on the Asset include four-laning of Aligarh-Kannauj and Palwal-Tappal-Aligarh Road sections, the Ganga Expressway, as well as the completion of the Yamuna Expressway (YE) – Eastern Peripheral Expressway (EPE) connector.

6.5 The commissioning of the proposed Ganga Expressway will directly compete with a considerably sized long-distance traffic plying on the Asset. Also, the Yamuna Expressway connection to EPE is expected to provide a positive impact on two plazas of the Asset (KM94 and KM164) as it will provide long-distance traffic travelling to and from regions farther north of Delhi improved access to the Asset as they can bypass Delhi NCR before joining (or after exiting) the Asset.

Table 6-1: List of network/other developments

S. No.	Development	Route affected	Year of impact	Impact (+/-)
1.	Palwal-Tappal-Aligarh 4-laning	Asset route: East-west NH 2 corridor connecting Delhi and Lucknow via Agra Alternate route: Palwal region connected to Aligarh-Lucknow via Palwal-Tappal-Aligarh Road section	FY27: 50%; FY27: 80%'; FY29 onwards: 100%	-ve
2.	Delhi-Mumbai Expressway	Asset route: North-south NH19 – NH52 corridor Alternate route: Market 1: Delhi-Ratlam-Indore Market 2: Delhi-Mumbai via Delhi-Mumbai Expressway	FY27: 50%; FY28 onwards: 100%	-ve
3.	Ganga Expressway	Asset route: Delhi-Agra-Lucknow through NH2/NH19 Alternate route: East-west expressway between Meerut and Prayagraj	FY27: 70% FY28 onwards: 100%	-ve
4.	Yamuna Eway-EPE Connector – + Agra Northern bypass	Traffic between Greater Noida industrial area and Agra/beyond currently using the Yamuna expressway	FY28: 20% FY30 onwards: 100%	+ve

[31] Delhi-Mumbai Expressway Update: Surat-Maharashtra stretch delayed, (March 2025)

Impact assessment for network/other developments

6.6 The section below includes a narrative for each of the network improvements or developments, as listed in Table 6-1 above, that are expected to have a material impact on future traffic growth on the Asset. Please note that all traffic volumes for impacts were estimated as impact rates applied on FY26 base AADT.

Delhi-Mumbai Expressway

6.7 The Delhi-Mumbai Expressway is a 1290-KM long greenfield expressway being developed to provide improved level of service to long-distance traffic between North and Western India compared to the existing national highways that are already operating at high-capacity utilisation. Competing with the traditional north-south NH corridors - NH 2 corridor containing the Asset and the NH 8 corridor part of the Golden Quadrilateral, the upcoming Delhi-Mumbai Expressway could provide faster and unhindered connectivity, as illustrated in Figure 6.1 above.

6.8 As discussed earlier, we have considered two types of north-south movements for this impact, as these have distinct cost comparisons between the Asset corridor and the upcoming expressway:

- **Indore region**: The route through the expressway via Ratlam/Garoth-Ujjain provides an alternate route for long-distance traffic to reach Indore.
- **Mumbai region and South India**: This traffic currently use either NH 8 or NH 2 to ply between Mumbai region, Kerela, and western parts of Karnataka in the south, and Delhi and regions in north. While Central and Eastern parts of Karnataka, Andhra Pradesh traffic already is part of the NH 44 route and therefore out of scope, we have not included Tamil Nadu in the in-scope traffic as we have observed recent shifts from other corridors to the NH 44 route. Overall, the route through expressway provides cost savings through unhindered, seamless, and quicker travel with potentially competitive toll costs.

6.9 A few sections of the greenfield expressway have been made operational with Sohna-Dausa-Lalsot section (Feb'23), Madhya Pradesh section (Sep'23), Vadodara-Bharuch section (Feb'24), Lalsot-Sawai-Madhopur section (Feb'24) and the Kota-Bundi Section (Dec'24) already being operationalised. Subsequently, additional stretches in Gujarat - particularly between Bharuch and Navsari (Jan'26) and the wider Vadodara–Navsari corridors[32] - have also been operationalised.

6.10 The project is currently suffering from construction delays, mainly on the Sawai-Madopur and Mukundra stretch between Delhi and Kota and Gujarat stretch on the Delhi-Vadodara section. The timeline for completion of the expressway has been revised several times and is now expected to be completed by of H1FY27 as per reports[31]. This partial construction completion has already started resulting in negative variance on account of the DME, as discussed in the earlier sections of the report.

6.11 We have estimated impacts as shown in tables below, using a GJC-based logit model. We have staged the impact over two years to account for a phased completion of various sections and gradual unfolding of the impacts.

Palwal-Tappal-Aligarh

6.12 The Palwal-Tappal-Aligarh Road is a two-lane/Four-lane section section that is a key connection between the region south of Central NCR and Aligarh-Lucknow corridor. The road is currently under expansion to 4-lane tolled road[33]. For long-distance traffic between Central NCR, west and northwest, and Lucknow and east, this upgrade would improve the level of service of the alternate corridor connecting the regions west and northwest of Central NCR with the region east of Lucknow.

[33] **Aligarh-Palwal Highway: UP Govt To Acquire 160 Hectares Of Land Across 21 Villages For Expansion;** (December 2024)

There are two bypasses, Khair and Jattari, that are not progressing as per the schedule and are experiencing delays. Further access near Aligarh is restricted due to congestion near the Aligarh bypass, hence smooth movement of traffic is currently affected. Site visit suggests that the traffic has to take a diversion after Khair (towards Gabhana toll plaza on Ghaziabad Aligarh section) to access Aligarh via local roads. Considering the slow pace of construction, it is anticipated that the construction will take an additional year, resulting in an assumed impact from FY28[33]. However, since commercial traffic is still moving on this section, the impact is assumed starting FY27.

6.13 Due to the discussed, diversion at Aligarh bypass, some of the traffic orginating east of Aligarh and destined to Palwal/Faridabad is currently appearing on the Ghaziabad Aligarh Asset. Once the completion of Palwal tappal 4 lane, it is expected that the traffic will start to reappear on KM46, and hence be a positive, while it continues to remain a negative for KM94 and KM164

6.14 Table 6-6 and Table 6-7 below presents the estimated impact on KM46 (Gadpuri), KM94 (Karman) and KM164 (Mahuvan), derived using a GJC-based logit model.

Ganga Expressway

6.15 The Ganga Expressway is a 596-KM long greenfield expressway being developed to provide improved level of service to long-distance traffic between western and eastern India. Competing with the traditional east-west NH corridors - NH 2 corridor containing the Asset and the Delhi-Agra-Lucknow and Purvanchal Expressways, the upcoming Ganga Expressway could provide faster and unhindered connectivity for long-distance east-west movement across the country, as illustrated in Figure 6.1 above.

6.16 We have considered two types of east-west movements for this impact, as these have distinct cost comparisons between the Asset corridor and the upcoming expressway:

- **Delhi region**: The route through the expressway provides a competitive route for long-distance traffic from Delhi and west to reach Lucknow and east. While toll costs are favourable for the Asset route, distance and time costs are lower on the expressway.
- **Northwest of Delhi**: The trips which are originating from Northwest of Delhi, including Karnal, Punjab, etc. and destined to Lucknow could also potentially prefer this route.

6.17 Assuming successful implementation of all the sections of the expressway, we have estimated impacts as shown Table 6-8 through Table 6-10 below, using a GJC-based logit model. We have staged the impact over two years to account for a phased completion of various sections and gradual unfolding of the impacts. The staging is to account for the gradual network shift expected to start in FY27[34]and materialise into the full impact as the network stabilises with completion of all sections of the Ganga Expressway.

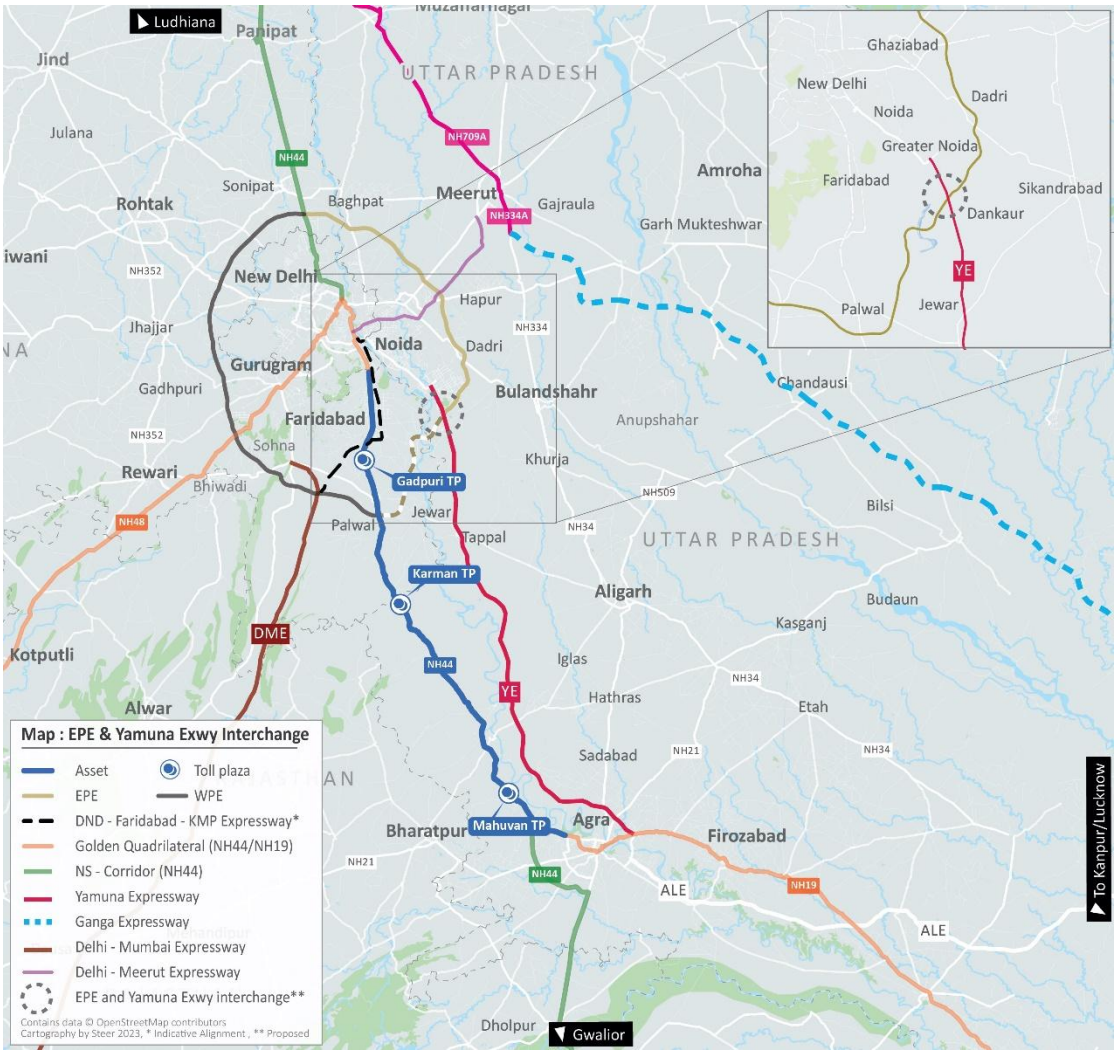
Yamuna Expressway- EPE connector – Northern ring

Figure 6.2: Yamuna - EPE connector – Northern ring



Source: Steer analysis and cartography

6.18 The existing alignment of the Eastern Peripheral Expressway runs from Sonipat to Palwal and does not intersect with the Yamuna Expressway. However, recently construction of the cloverleaf loop connecting EPE to Yamuna Expressway near Jewar has commenced. The connection will result in improving connectivity between parts of Noida, Greater Noida, Delhi NCR and Agra. As a result, the traffic which currently originates in the industrial corridor near Greater Noida and is destined to Agra/beyond will have an alternative via the EPE-Asset route who would have otherwise been using the Yamuna expressway currently.

6.19 As per the latest data available for Yamuna Expressway approximately 1000 trucks currently use the Yamuna Expressway. Since the Yamuna Expressway operates at toll rates of approx. more than 14 Rs/Km (compared to the approx. 10 Rs/km on the Asset for Multi Axle vehicles [35], once the connector between Yamuna Expressway and EPE

[35] Toll rates hiked on Yamuna Expressway from October 1 - Hindustan Times (September 2024)

becomes operational this volume of traffic will be able to access Agra via the Asset which will be characterized by toll saving, and a marginal time saving. Therefore, it is expected that a small proportion of the trucks will divert towards the Asset from Yamuna expressway. The positive impact of this development is expected to appear on the Asset starting FY28 in our forecasts. The estimated impact of this development on KM94 and KM164 toll plazas are presented below.

Table 6-11: Impact due to Yamuna-EPE connector-Northern ring: KM94 Karman

Capacity Constraints

6.20 As per the concession agreement, the Asset's design capacity is set at 120,000 PCU's (an average of all three plazas). As congestion increases on the road, the level of service offered by the Asset reduces resulting in traffic either diverting to other alternates or a suppression in local trips takes place primarily in passenger vehicles due to the perceived congestion profile of the Asset.

6.21 Our forecasts suggest that the Asset will start reaching design capacity FY41 onwards, and in this scenario, we believe that will reduce the frequency of short to medium-distance passenger trips on the Asset. We have incorporated this impact into our projections by introducing a growth dampener from FY35 onwards, that results in a slowing year-over-year growth rate of passenger vehicles post FY35.

Summary of impact assessments

6.22 Table 6-13 below summarises the potential impacts on the Asset due to the several ongoing and foreseen improvements on the alternate routes, the Asset route, and other regulatory developments.

Table 6-13: Summary of impact assessments

Impact	Year of impact	Probability/ scale of impact	In-scope traffic	Direction of impact (+/-)
Delhi-Mumbai Expressway Diversion impact from competing under-construction north-south expressway connecting Delhi to Mumbai	FY27 onwards	High	Traffic plying between Indore region and Delhi/north	**-ve**
			Traffic plying between Mumbai region and South India at one end, and Delhi/north at the other	**-ve**
Palwal-Tappal-Aligarh Diversion impact due to improved feeder route to alternate corridor	FY27 onwards	High	Trips between Delhi/west/northwest at one end and Lucknow and east at the other	**+ve for Gadpuri; -ve for Mahuvan and Karman**
Ganga Expressway Diversion impact from upcoming and competing east-west expressway connecting Delhi to Mumbai	FY27 onwards	Medium	Trips between northwest of Delhi, and Lucknow and east	**-ve**
			Trips between Delhi and west, and Lucknow and east	**-ve**
Yamuna-EPE connector – Northern Ring	FY28 onwards	Medium		**+ve**
Capacity induced constraints	FY35 onwards	High	Passenger traffic (CJVs) at the breach of capacity	**-ve**

Revenue forecasting assumptions

6.23 To forecast the revenues for a forecast year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate. While toll segmentation provides the breakup of trips paying each ticket type, trip factors provide the conversion factor to convert from traffic (trips) to tickets sold. This section discusses assumptions related to toll segmentation, trip factors and toll rates for the forecast period.

Toll evolution

6.24 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation (as of December 2024). These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.25 We have used actual toll rates from the FY25 toll notifications and FY26 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in Table 6-14 below. These forecasts provided by the

Client. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client.

Table 6-14: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.6%
FY27	0.96%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: FY27 onwards WPI as per Client input.

6.26 Table 6-15 below provides an overview of toll estimation method as per the FY25 & FY26 toll notifications, and the concession agreement.

Table 6-15: Toll estimation overview

Toll fee escalation	Revision date	Nearest rounding
Linked to 100% WPI increase	April	5

Source: Concession agreement and toll notification

Toll segmentation and trip factors

6.27 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles[36].

6.28 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and post-annual pass segmentation from 15th August 2025 till 28th February 2026. The share of annual pass trips in March 2026 has been assumed to be the same as the share of annual pass trips in the last 10 days of February 2026.

6.29 The segmentation for CJVs in FY27 has been assumed to be the same as the estimated March 2026 segmentation as trends suggest that the share of annual pass trips have stabilised.

6.30 For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as highlighted in Chapter 3. For the traffic and revenue forecast of other vehicle categories, FY26YTD (Apr- Feb) as discussed in the earlier sections, can be considered a normal period. Therefore, we believe the FY26YTD segmentation is representative of the travel patterns on the Asset and the same has been assumed for forecast years as well. This is presented below.

[36] Finalization-Concessionaire-Annual-Pass-Facility-on-NHs-01092025.pdf

6.31 The table below provides the toll segmentation assumed for the period of forecast.

Trip factors

6.33 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY26YTD data available and listed in the table below:

Table 6-20: Trip factors for the forecast years for TP1 Gadpuri

Traffic and Revenue forecasts

6.34 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the Asset over its remaining concession period i.e., FY26-44. Table 6-23 and Table 6-24 below present the AADT/PCU forecast growth rates and CAGRs for KM46 (Gadpuri). Table 6-27 and Table 6-28 below present AADT/PCU forecasts and associated growth rates for KM94 (Karman), and Table 6-31 and Table 6-32 present the same for KM164 (Mahuvan). In addition, Appendix B presents detailed forecasts of AADT and revenues for all three toll plazas on the Asset over the forecast period.

Table 6-23: Final traffic forecast: KM46 (Gadpuri)

Upside and Downside cases

Upside and Downside scenario assumptions

6.35 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.36 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.37 To account for the possible variations in the growth drivers, we also present an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6-35: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.38 Further, network developments are highly dependent on governmental directions, policies, legal and financial measures which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case for our network-related impacts as well. However, consistent with our macro-economic assumptions, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.39 The upside case impacts included in forecasts are summarised in Table 6-36 below.

Table 6-36: Summary of impacts on the Assets - Upside Case

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact

Upside and Downside Case Forecasts

6.41 The table below presents the difference between the Upside and Downside Case forecasts relative to the Base Case forecasts in FY44 (i.e., the concession end year) for both Asset toll plazas. The charts below plot the Upside and Downside Case forecasts relative to the Base Case forecasts for each Asset toll plaza over the full concession period (FY26-FY44).

Table 6-38: Percentage Difference Upside and Downside Case Forecasts vs. Base Case Forecasts - FY44

Case	Measure	TP1 Gadpuri	TP2 Karman	TP3 Mahuvan
Upside Case	Traffic (PCU)	31.4%	36.4%	35.7%
Downside Case		(21.6%)	(24.3%)	(23.9%)
Upside Case	Revenue	48.9%	55.5%	54.4%
Downside Case		(30.7%)	(33.2%)	(32.7%)

Summary outlook

6.42 The Asset is a 179.5 km toll road between Delhi and Agra which forms a part of the NH44. The Asset forms part of the Grand Trunk Road – which is part of the prominent Asian Highway 1 (AH1) - that forms part of a wider longer strategic corridor that connects Delhi NCR and other regions in North India with other regions in the country.

6.43 The Asset consists of three toll plazas – KM46 Gadpuri, KM94 Karman and KM164 Mahuvan. The Asset's strategic and geographic location is a significant advantage as it offers seamless connectivity to users via the upgraded expressway network in the form of KMP and EPE. It is the preferred route for north-south and north-east movement, connecting regions such as Jammu and Kashmir, Punjab, Haryana to Karnataka, Tamil Nadu, Telangana, Andhra Pradesh, Eastern Uttar Pradesh, and Bihar.

6.44 The Asset serves a significant volume of local passenger traffic, as it connects densely populated areas such as Palwal, Faridabad, New Delhi to Mathura, Vrindavan, and Agra over short-to-medium distances. We anticipate a healthy growth in car usage on the Asset due to the shift away from public transport by users, and the increasing ownership of cars in the National Capital Region.

6.45 The Asset's provide improved Level of Service (LoS) due to its six-lane configuration. The steady growth in traffic in recent years is expected to continue in the future. Although some of this growth can be attributed to network shifts, we expect a significant share of natural traffic growth to characterise the Asset’s performance going forward.

6.46 We see a positive outlook for the region and the Asset as it serves significant urban centres such as Delhi NCR, Faridabad, Palwal, Agra, Mathura, and Vrindavan. Furthermore, it caters to long-distance movements to/from Chennai, Bangalore, Hyderabad, etc. The underlying growth drivers of the corridor are strong, which we believe will deliver sustained long-term traffic growth on the Asset.

6.47 Our observations, analysis and conclusions in this report are based on thorough analysis of primary and secondary data, site visits, feedback from Client meetings, and macroeconomic assumptions prescribed by the Client. While there may be both positive and negative risks associated with these assumptions and forecasts, the broad growth outlook for the Asset remains positive owing to its strategic position as a key link between Delhi and North India and the rest of the country, including the East, Central and Southern parts of the country. It's proximity to Delhi NCR and other industrial clusters in and around the region also bode well for the Asset as it will continue to observe traffic flows that originate from or are destined to these production and consumption centres, and will continue to experience the indirect impacts of general economic growth in the region and the country despite network related improvements and developments that may also impact traffic growth on the Asset over time.

Appendices

A Top 10 OD Pairs

A.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. Please see this data for both CJVs and MAVs and OSVs combined below.

KM46 Gadpuri

Table A.1: CJV and Bus top 10 OD pair shares at KM46 Gadpuri

	OD Pair	Share
1.	Palwal city-Faridabad City	11%
2.	Mathura-Central Delhi (inside ring road)	8%
3.	Central Delhi (inside ring road)-Palwal city	8%
4.	Mathura-Faridabad City	7%
5.	South West Agra including Agra City-Central Delhi (inside ring road)	6%
6.	Palwal city-Ballabgarh	5%
7.	South West Agra including Agra City-Faridabad City	4%

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. The report is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through February 2026. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the

Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Farakka-Raiganj Tollway Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 11 project". This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to February 2026 and latest macro-economic assumptions.

1.2 The Asset Farakka-Raiganj consists of a single stretch of toll road with two toll plazas. For the purpose of this report, we hereafter call the toll plazas present on the Asset as TP1 and TP2 respectively as:

- TP1 – Lakshmipur
- TP2 – Gazole

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between Oct'20 and Mar '26, with FY26 base AADT and forecasts considering data up to Feb'26
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer in 2026 at TP1 and TP2.
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis

Scope of work	Data source
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor • Gross Domestic Product (GDP) forecast assumptions provided by Client
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI) and latest actual Wholesale Price Index (WPI) trends as shared by the Client. • Assumptions of WPI forecasts and future tolling length changes provided by Client • Revenues estimated as a product of traffic forecasts and toll evolution

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis has essentially focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting October 2020 to February 2026. The historical traffic and revenue presented in Chapter 3 considers information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous studies related to traffic and revenue
  - Bid documents and studies by lenders
  - In this study, Steer-commissioned OD surveys at TP1 on 6th March 2026 and at TP2 on 10th March 2026. TVC was conducted at TP1 between 4th-6th March 2026 and at TP2 between 6th–9th March 2026.
- We undertook revenue reconciliation on FY26YTD by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported

revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position by applying seasonality correction factors (SCFs) on the 11 months of actual traffic data available (April to February).
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.7 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic trends on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of India, the corridor and region/state containing the Asset, along with our approach and results on estimating background along with our key forecasting assumptions,
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth

- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases.

2 The Asset

Introduction

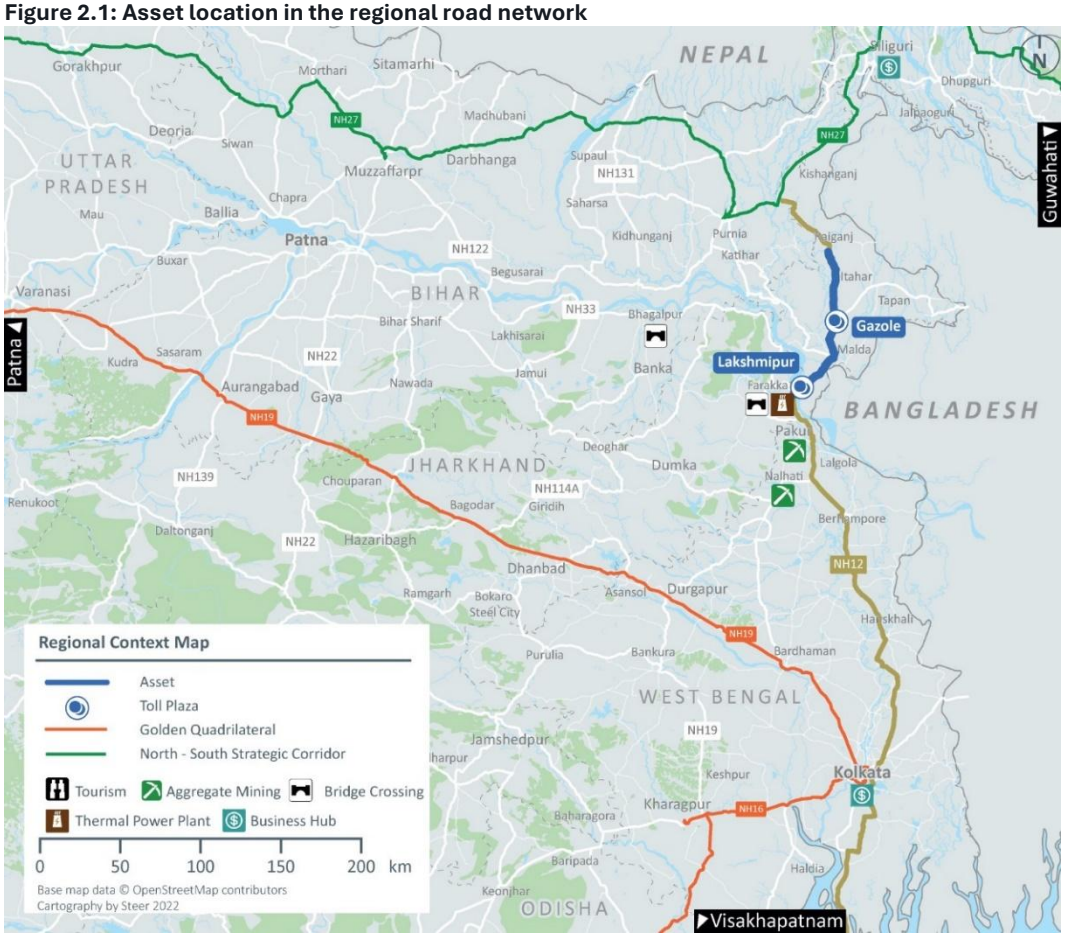
2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of West Bengal, connecting the cities of Farakka and Raiganj and provides connectivity to the city of Malda. The Asset is also located very close to the international border of Bangladesh

2.3 The figure below shows the regional road network in which the Asset is located.

Figure 2.1: Asset location in the regional road network



Source: Steer cartography using OpenStreetMap data.

2.4 As the Asset sits near the border, it also provides connectivity to international land ports on India-Bangladesh border at Mahadipur and Hili (via NH512) connected to the Asset at Malda and Gazole respectively.

2.5 Traffic on the project road is primarily commercial traffic carrying goods to/from different parts of the state of West Bengal, the north-eastern states, adjoining western states (Bihar and Jharkhand) and some southern states (such as Andhra Pradesh and Tamil Nadu).

2.6 The Asset primarily caters to three different types of strategic movements:

- **Short-distance trips** between Malda and other towns in Malda and Murshidabad districts.
- **Medium-distance** trips between southern and northern parts of West Bengal, including movements between Pakur district of Jharkhand, Malda, and Bangladesh.
- **Long-distance trips** between South and East India including Kolkata, and Northeast India. Kolkata is the largest urban agglomeration and one of the four older metropolitan cities of India and is both a large attractor and generator of consumption-linked commodities in East and Northeast India.

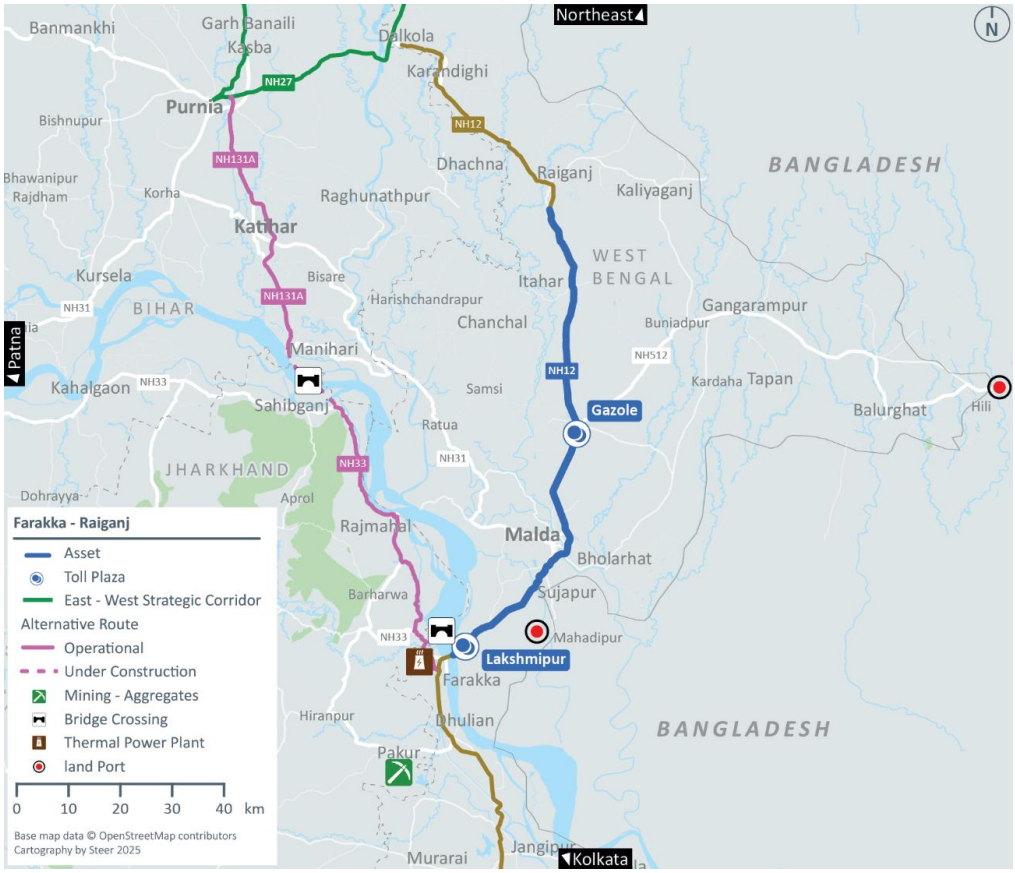
2.7 Essentially, both medium-distance and long-distance movements need to cross the two-lane Farakka Barrage, on the Ganges River, located just at the southern end of the Asset which makes the Asset a crucial funnelling link between southern and northern parts of West Bengal state. Traffic between Kolkata/Durgapur/Bardhhaman and Kishanganj/northeast regions use this barrage, and it is the only bridge crossing available in the region or on this route along the NH12. As a result, the Asset forms part of a strategic corridor that primarily serves long distance commercial traffic.

Asset context

2.8 The Asset is a 100 km toll road section of the NH12 that is the main north-south highway in West Bengal. It is a four-lane highway with two toll plazas, namely, Lakshmipur (TP1) at Km 297.9 (nearer to Farakka) and Gazole (TP2) at Km 351.4 (nearer to Raiganj).

2.9 Malda and Gazole are major settlements situated along the Asset and serve as trip generators / attractors of short – medium distance passenger and commercial traffic that are observed crossing one or both toll plazas on the Asset. Figure 2.2 below provides a closer view of the Asset in the context of its immediate surroundings.

Figure 2.2: Asset context



Source: Steer cartography using Open Street Map data

Concession and tolling details

2.10 Both toll plazas on the Asset have been operational since October 2016, and the Client assumed operations in September 2020. Currently, FY42 is expected to be the last year of the concession, implying 16 years remaining in its concession life. Table 2.1 below summarises key aspects of the concession.

Table 2.1: Key concession details

Particulars	Details
State	West Bengal
Highway and lane configuration	NH12, four-laned
Toll plazas	• TP1: Lakshmipur • TP2: Gazole
Appointed date	February 2011
Commencement of operations*	October 2016
Operated by Client since	September 2020
Concession period	30 years
Last year of concession	FY42
Tollable length (Km) as per concession agreement, applicable	TP1: 56.715 km (including 9.05 km Malda Bypass)

Particulars	Details
	TP2: 43.375 km

Source: Client Data

2.11 Figure 2.3 below shows a typical cross-section of the Asset and its toll plazas.

Figure 2.3 (clockwise): TP1 Lakshmipur, TP2 Gazole, Farakka bridge, Movement of stone in Mahadipur

Source: Steer site visit

2.12 Tolls are collected for the following ticket categories: Single, Return, Local Commercial, and Monthly tickets. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling.

2.13 Table 2.2 below presents single journey toll rates for FY26 at both the toll plazas.

Table 2.2: Single toll rates on the Asset (INR), applicable April 2025 to March 2026

Type of Vehicle	Single Journey Fee	
	TP1 Lakshmipur	TP2 Gazole
CJV	145	65
LCV	230	105
Bus/Truck	470	225
HCM/EME/3A/MAV	720	350
OSV	915	425

Key economic activities

2.14 Traffic on the Asset is primarily commercial traffic carrying agricultural commodities, and construction materials to/from different areas within the state of West Bengal, the north-eastern states, neighbouring states of Bihar and Jharkhand and some southern states (such as Andhra Pradesh and Tamil Nadu). It also serves traffic originating from or destined to neighbouring countries of Nepal, Bhutan and Bangladesh. West Bengal is regarded as the gateway for India's Act East Policy[1], which aims to strengthen India's strategic, economic, and cultural ties with the Southeast Asian countries, including Bangladesh. In this context, the Asset can be classified as providing critical infrastructure connecting India to Bangladesh via land ports at Mahadipur and Hili.

2.15 Pakur district (JH), located 25 km south of the Asset, is an important region for the production and transportation of stone aggregate to Bangladesh via land ports at Mahadipur, Hili, and other locations further north and along the India-Bangladesh international border. As of January 2018, there were 246 operative and non-operative stone mines across the full district[2] and 255 stone-crushing units[3] that process stone mined from quarries into stone chips/aggregates that are transported to serve construction demand both domestically and across the border in Bangladesh. Seasonal changes, mining regulation, and govt. policies such as vehicle overloading restrictions all have direct and indirect impacts on commercial traffic growth on the Asset as they relate to the productivity and operations of these mines.

2.16 Thus, key economic activities in the region include agriculture and related activities (cotton, rice, and vegetables being the major commodities) and stone (aggregate) mining. Agricultural commodities that are produced and transported via the asset from local farms and cold storages vary by season, and specific externalities. Mining output and materials carried on the asset are impacted by market demand dynamics in both domestic and international markets (primarily Bangladesh), government policies and regulation, as well as seasonal variation. The extent to which these factors do and could continue to impact traffic growth on the Asset is discussed briefly in Chapter 6 below.

Influence of Bangladesh Economy and Domestic Policies on Asset Performance

2.17 As aforementioned, international demand for construction material, particularly stone chips/aggregate demand in Bangladesh serves as an important driver of commercial traffic growth on the Asset. Given the strategic significance of Bangladesh’s economy to the Asset, it is important to review how economic conditions in Bangladesh over the past year have evolved and impacted traffic growth on the Asset:

2.18 In FY24, the country's commercial banks had struggled to meet their import payment obligations, which reduced their foreign exchange reserves[4] and made it more challenging

[1] **Bangladesh corridor vital to India’s ‘Act East’ policy (World Bank blog, September 2017)**

[2] **(PAKUR) DISTRICT SURVEY REPORT FOR STONE MINING (2016-2017)**

[3] **https://dcmsme.gov.in/dips/Pakur.pdf**

[4] **Major challenges for Bangladesh economy in 2023 | The Financial Express**

to get "Letters of Credit". This continued through the early part of FY25 as well before significantly improving over the past five months[5].

2.19 According to a report published by the Asian Development Bank[6], the downturn in the Bangladesh economy in FY23 and early months of FY24 reflected falling private and public investment tied to high inflation and lower export demand. In FY24, GDP growth in Bangladesh slowed further and expectations of growth in FY25 were also qualified given impact of global supply chain disruption and political transition.

2.20 In addition to the above, which has affected construction activity in Bangladesh and subsequently reduced stone chip/aggregate exports from India (see Figure 2.4 below), domestic policies such as the crackdown on illegal stone mining and quarrying in Jharkhand (and across the wider nation) and other market factors[7] have also impacted production of stone chips/aggregate in Pakur district over the past few years. Both these developments have contributed to suppressed growth of commercial volumes on the Asset. However, a recovery Bangladesh-bound exports can be seen from October 2025, with the political situation in Bangladesh stabilising. With fresh elections and a new government being formed in February 2026, Bangladesh-bound traffic is expected to stabilise from FY27 onwards. Based on this, expectations of future growth in commercial traffic on the asset is discussed in more detail in Chapter 6.

Alternate and feeder routes

Alternate routes

2.21 Following from the strategic network context of the Asset (as described above), this section details alternate routes that are either currently available or may be potentially available (in future) to users of the Asset. As part of this study, we have conducted an extensive review of these alternate routes and network developments and have incorporated the impact of those that we believe would impact the Asset significantly into our final traffic and revenue forecasts. These impacts can be summarized as follows:

- Ro-Ro service between Rajmahal and Manikcha[8] : For north-south movements on road, the NH12 (Asset) is the only option for medium-distance traffic between Pakur district (JH) and Malda (WB) or Bangladesh. However, according to truck driver interviews conducted during our site inspections, the unofficial Ro-Ro service between Rajmahal (JH) on the southern bank, and Manikchak (WB) on the northern bank of the Ganges offers an alternative north-south route to the Asset. This route is typically used during times of severe traffic congestion on the Asset, generally due to roadworks and construction activity on the Farakka Barrage. Based on our site visit observations and general understanding of travel patterns within the regional network, the service provided by the Ro-Ro route is currently of an informal set-up, and unlikely to form a competing alternative to the asset for medium-distance commercial volumes carrying stone chip/aggregate materials to/from Pakur to other parts of WB and into Bangladesh. Therefore, we have excluded any potential impact of this route alternative on future traffic growth on the Asset.
- New bridge over Ganga River in Sahibganj, Bihar: A four-lane bridge of length 6km on the Ganges River near Sahibganj, is currently under construction between Sahibganj and Manihari. It is expected to be completed by second half of FY27. This would provide a route choice to the OD pairs including but not limited to, south of Farakka (including Kolkata, Bardhhaman, Pakur) and North of Raiganj (area between Kishanganj and Supaul including Purnia, Katihar). This impact is evaluated in Chapter 6 below.

Feeder routes

2.22 Over the past few years, several sections of the NH12 highway have been upgraded over time and have significantly improved the overall Level of Service provided by the highway for vehicular traffic travelling both short and long-distances between north, central, and south WB, as well as from/to neighbouring states. While the 4-laning of Farakka-Raiganj section of the NH12 (i.e., the Asset) was completed in FY22[9], the upgrade of the highway extending further north and south of the Asset generally bodes well for traffic growth on the Asset as overall Level of Service (LoS) across a longer stretch of the NH12 is improved and made more attractive to users travelling both short and longer distances. Some of these improvements considered in our network analysis include the following:

- The Dalkhola bypass on the NH12 that was completed in FY22.

[8] **What Is RoRo Shipping? A Guide for Businesses & Individuals**

[9] **AS172.pdf**

- By March '24, the section of the NH12 north of the Asset between Raiganj and Dalkhola had also been fully upgraded to 4-lanes, along with the opening of the Raiganj Bypass and ROB in May 2024.
- 4-laning of the Krishnanagar-Behrampore section of the NH12.
- The new Farakka Setu, which is a ~2.6km 4-lane road bridge connecting Farakka to Baishnabnagar across the Ganga is under construction. Construction is expected to get completed by the second half of FY27.

2.23 We understand that the new bridge will act as a replacement to the existing Farakka Barrage where road traffic will be fully restricted post completion of the new bridge. Plans to construct a rail bridge alongside the completed road bridge have been voiced but not officially sanctioned.

2.24 Based on the network developments listed above, we believe the impact of the improved LoS of the NH12 highway due to completion of the Dalkhola Bypass, Raiganj Bypass and ROB, as well as 4-laning of the full Farakka to Dalkhola section of the NH12 is already being observed on the Asset. The construction of the New Farakka Setu over the past several years and expected construction of the rail bridge beside it is expected to keep construction related traffic growth on the Asset consistent over the near to medium-term. In our analysis, we have not included any additional LoS impact due to the New Farakka Setu as it is meant to replace the access currently being provided by the Farakka Barrage. Given that the Krishnanagar-Behrampore section of the NH12 is still not full upgraded to 4-lane configuration, we have incorporated the impact of this improved LoS on NH12 in our future traffic growth forecasts on the Asset.

Overloading

2.25 Given the nature of commodities carried by commercial vehicles on the Asset, which primarily comprise heavy weight high-volume items such as construction materials - particularly stone chips/aggregates - overloading of commercial vehicles has been historically prevalent on this corridor. Overloaded vehicles are charged through a staggered overloading penalty system, where truckers pay up to 10 times the toll as a penalty.

2.26 Due to historical prevalence of overloading on the corridor, several truckers using the NH12 to transport commodities have also become accustomed to paying overloading penalties and have pre-determined routes that account for the various hidden and apparent transaction costs of transporting goods in overloaded vehicles.

3 Traffic Description

Introduction

3.1 This chapter presents historical traffic and revenue growth trends on the Asset, as well as our analysis of origin-destination (OD) data and traffic count data sourced from primary surveys. This covers data which was collected as a part of this study and previous studies, as well as data provided by the Client.

3.2 Traffic count data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Toll plaza data is used as the primary basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

3.4 The below sections present historical traffic and revenue information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.

PCU Factor assumption for Forecasts

3.5 The PCU factors considered in Table 3.1 below are as per IRC64 1990[10]. Based on the discussion with the Client, we have referred to the rigid and trailer splits from the TVC data collected earlier for calculating the effective PCU for MAVs. For Rigid trailer trucks we have assumed a PCU factor of 3, whereas for Trailer trucks we have assumed a PCU factor of 4.5 as defined in IRC64 1990

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
Mini LCV	1.0
LCV	1.5
Bus	3.0
2A	3.0
3A	3.0

Historical trends

3.6 The table below presents the historical traffic evolution for each of the Asset toll plazas. Historical traffic data on the Asset is available from October 2016 through FY26YTD (February 2026). However, since the data for the complete FY17 is not available, Table 3.2 to Table 3.5 below present the data between FY18 and FY26YTD.

Table 3.2: Traffic levels at TP1 Lakshmipur

Tollable PCU	**20,995**	**20,075**	**23,494**	**22,486**	**23,019**	**24,784**	**25,308**	**26,018**	**27,838**	**3.6%**

Source: Steer analysis of Client data; FY26 AADT represents the full year actual (April to March); Tollable traffic excludes exemption and violation; *2A includes Buses till March 2021

3.7 TP1 (Lakshmipur) observed a CAGR of 1.9% in terms of PCU between FY18 and FY26, while TP2 grew by CAGR 3.6% in the same period. The increase in CJV volumes at both toll plazas in FY25 and FY26 can be attributed to an increased LoS offered by the completion of the Raiganj Bypass and ROB north of the Asset as well as the completion of the 4-laning of the Dalkhola-Raiganj section of the NH12 by March 2024 making CJV travel more attractive.

3.8 TP2 (Gazole) carries more CJV traffic compared to TP1, as TP2 is closer to the town of Malda which contributes to higher passenger traffic on the Asset. Additionally, 2A+Bus

account for a considerable share of total traffic at both plazas, at around 1,500 and 2,000 AADT in FY26 at TP1 and TP2 (respectively).

3.9 The growth trend of tollable traffic on the Asset has been at the same level as that of total traffic. For the period of FY18-26, TP1 Lakshmipur recorded an average annual growth of 1.9% per year for its tollable PCU (same as total PCU growth in the same period). Over the same period, TP2 recorded an annual growth of 3.6% per year for its tollable PCU.

3.10 3A category has shown a negative trend historically. The reduction in 3A volume is a result of the declining demand for 3A vehicles, which are being replaced by 2As and MAVs – a trend not unique to the Asset or region. MAVs offer higher tonnage capacity making them more cost-effective for transporters with the Asset primarily catering to construction traffic, movement towards MAV's is more favourable for users. While the increase in 2A volume reflects the growing preference for these vehicles due to favourable changes in the legal permissible loads for 2As and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. This is consistent with our discussion with various transporters and OEMs across the country who are favouring 2A and 5A vehicles for commodity movement due to better unit economics.

3.11 The decline in commercial volume especially in FY25 and part of FY26 has been contributed by decline in exports to Bangladesh, due to the recent economic and political turmoil the country has seen (refer chapter 2). It is expected that the Bangladesh economy should revive in the medium term resulting in improved traffic performance on the Asset.

3.12 Table 3.6 and Table 3.7 below present total annual revenue (in INR Cr) and AADC (in INR Lakhs) at TP1 and TP2 respectively over the period FY21-FY26.

Table 3.6: Total revenue (INR Crores) and AADC (annual average daily collection) in INR Lakhs at TP1 Lakshmipur

Year	TP1 (INR Crores)	AADC	AADC Growth (%)
FY21	88.3	24.2	-
FY22	140.2	38.4	58.8%
FY23	155.6	42.6	10.9%
FY24	162.2	44.3	4.0%
FY25	165.8	45.4	2.5%
FY26	175.5	48.1	5.9%

Source: Steer analysis of the Client data; FY26 represents full year actual (April to March).

Table 3.7: Total revenue (INR Crores) and AADC in INR Lakhs at TP2 Gazole

Time Period	TP2 (INR Crores)	AADC	AADC Growth (%)
FY21	78.4	21.5	-
FY22	63.2	17.3	(19.4%)
FY23	69.7	18.7	7.9%
FY24	70.5	19.3	3.1%
FY25	72.9	20.0	3.6%

Time Period	TP2 (INR Crores)	AADC	AADC Growth (%)
FY26	80.4	22.0	10.3%

Source: Steer analysis of the Client data; FY26 represents full year actual (April to March)

3.13 As of FY26, TP1 Lakshmipur has reported an AADC of INR 48.1 Lakhs – significantly higher than the INR 22.0 Lakhs reported by TP2 Gazole.

Toll Frequencies

3.14 Toll frequency or ticket segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has a different ticket segmentation. As a part of our historical data analysis, we calculate toll frequencies for each vehicle category from the latest monthly traffic data shared by the Client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract local commuters to opt for these category passes instead of evading toll. Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For the Asset, the segmentation discussed below reports Exemptions and Violations together.

3.15 Understanding toll frequencies provide us insights into the nature of traffic using the Asset. CJVs generally have higher shares of return passes or local monthly passes because they travel for short to medium distances, while heavy trucks mostly have single tickets since they travel longer distances. The Asset catering to short distance local traffic generally observes high share of return or other local monthly passes while the Asset catering to strategic long-distance traffic generally observes high share of single ticket traffic. Table 3.8 below presents ticket types currently sold at both the Asset plazas.

Table 3.8: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows the vehicle to cross the plaza twice in a day at discounted rates.
Monthly Pass	Discounted ticket for all road users issued at toll plaza who intend to undertake multiple single trips using the toll plaza. 50 trips are allowed on a discounted rate to be used within 30 days of issue.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

Source: Client data

3.16 As a general pattern, the shares of single/return/monthly tickets tend to stabilise within 2-3 years of the commencement of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip

patterns. During FY21 and FY22, however, two key events impacted the traffic patterns throughout the country: COVID-19 and FASTag implementation.

3.17 FY21 had multiple disruptions in traffic patterns related to the pandemic. In February 2021, there was also significant change in ticket segmentation observed across several toll roads around the country due to the imposition of the use of FASTag, the electronic toll payment system mandated by the National Highway Authority of India (NHAI). This mandate significantly changed ticket patterns in FY21 and FY22 across most (if not all) toll road assets across the country including the Asset. However, by FY23, travel patterns had stabilised, following which they can be considered to follow normal travel behaviours on the Asset.

Introduction of Annual pass for CJVs

3.18 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.19 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

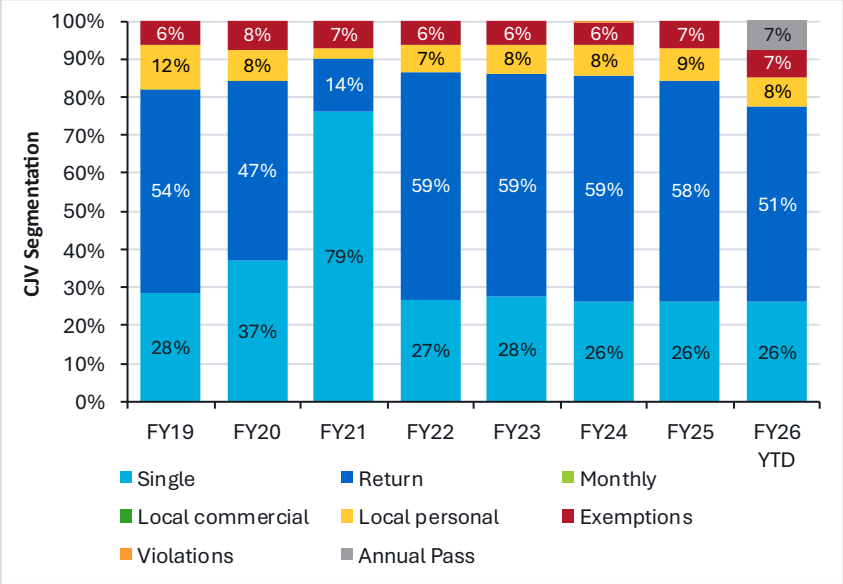
The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
  Provide cost-effective travel for frequent users of NH/NE toll roads

Share of traffic by payment type

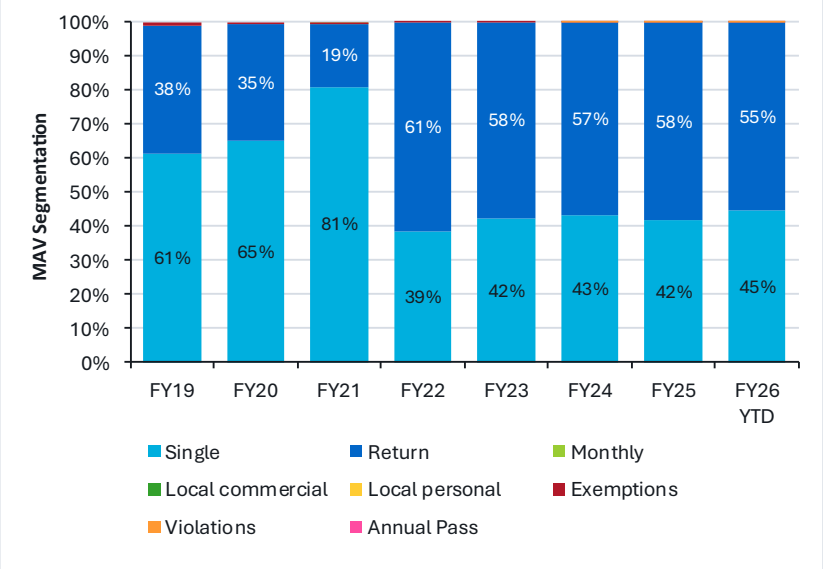
3.20 In our forecasted segmentation we have used the average ticket distribution by vehicle category observed in FY26YTD (Apr'25 – Feb'26) and held that constant through the end of the forecast. Figure 3.1 through Figure 3.4 below present historical changes in toll segmentation at both TP1 and TP2 for CJVs and MAVs.

Figure 3.1: Ticket-segmentation for CJV (TP1 Lakshmipur)



Source: Steer analysis of the Client data; FY26YTD includes data till Feb'26

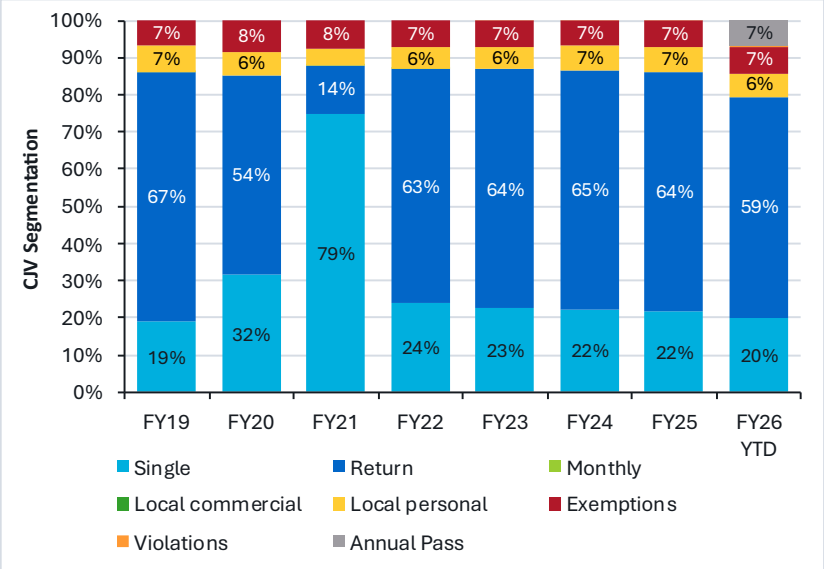
Figure 3.2: Ticket-segmentation for MAV (TP1 Lakshmipur)



Source: Steer analysis of the Client data; FY26YTD includes data till Feb'26

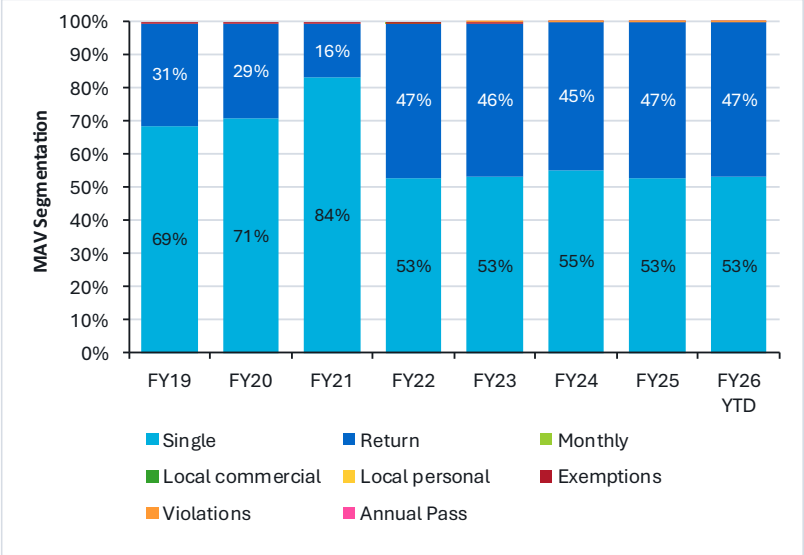
3.21 Ticket segmentations for both CJVs and MAVs at TP1 in FY26YTD are consistent with FY24 and FY25 segmentations. Return tickets remain as the dominant ticket category in FY26YTD accounting for more than 51% of tickets in both CJVs and MAVs. At TP1, the share of local personal tickets and exemptions for CJVs are 8% and 7% (respectively) as of FY26YTD and comparable to FY25 shares of the same tickets. This indicates stability in the travel patterns with no major differences. The high share of return tickets in MAVs (at 55% in FY26YTD) reflects the prevalence of short-medium distance commercial trips.

Figure 3.3: Ticket-segmentation for CJV, TP2 Gazole



Source: Steer analysis of the Client data; FY26YTD includes data till Feb'26

Figure 3.4: Ticket Segmentation for MAV, TP2 Gazole



Source: Steer analysis of the Client data; FY26YTD includes data till Feb'26

3.22 At Gazole, travel patterns are like Lakshmipur for CJVs where return remains the dominant ticket category. For MAVs however, the share of single tickets at TP2 is higher than observed at TP1.

3.23 The ticket segmentation across all vehicle categories except CJVs in FY26YTD is consistent with FY25 levels. The introduction of annual passes in August 2025

3.24 Table 3.9 below depicts the FY26YTD segmentation (Apr'25-Feb'26) for LCV, Bus and 2As at TP1 Lakshmipur and TP2 Gazole.

Table 3.9: Ticket-segmentation for LCV, Bus and 2As at TP1 Lakshmipur and TP2 Gazole (FY26YTD)

Ticket Category	TP1 Lakshmipur				TP2 Gazole			
	LCV	Bus	2A	3A	LCV	Bus	2A	3A
Single	42%	17%	75%	78%	42%	10%	63%	73%

Ticket Category	TP1 Lakshmipur				TP2 Gazole			
	LCV	Bus	2A	3A	LCV	Bus	2A	3A
Return	52%	81%	23%	22%	57%	90%	36%	26%
Monthly	-	-	-	-	-	-	-	-
Local commercial	-	-	-	-	-	-	-	-
Exemption	6%	1%	2%	0%	1%	0%	1%	0%

Source: Steer analysis of Client data

Overloading

3.25 Based on our analysis of the historical data as shown in **Error! Reference source not f ound.** and **Error! Reference source not found.** below, the Asset shows a notable share of overloaded vehicles, especially for 2As, 3As and MAVs. This is due to the high share of denser commodities like aggregate and stone being carried on commercial vehicles on the Asset. FY26YTD overloading trends (compared to FY25) show a decline in LCVs and a rise in MAVs. The below figure and table layout the historical levels of observed overloading on the Asset.

3.26 As observed in Table 3.10 below, due to strict restriction on overloading, the shares have consistently declined across all vehicles categories since FY21.

Table 3.10: Overloading shares between FY21-FY26YTD

Vehicle type	FY21	FY22	FY23	FY24	FY25	FY26 YTD
TP1						
LCV	6.2%	11.2%	5.1%	2.5%	1.8%	1.1%
2A	4.6%	0.8%	0.5%	0.3%	0.5%	0.4%
3A	3.6%	0.3%	0.2%	0.2%	0.2%	0.1%
MAV	15.1%	2.0%	2.4%	1.7%	5.6%	6.5%
TP2						
LCV	4.3%	8.7%	5.2%	3.4%	2.3%	2.2%
2A	2.5%	0.7%	0.5%	0.5%	0.6%	0.7%
3A	3.0%	0.4%	0.4%	0.3%	0.3%	0.6%
MAV	10.7%	1.5%	1.4%	0.0%	2.4%	2.9%

Source: Steer review of Client TMS data; FY26YTD includes data till February'26

3.27 The share of overloaded 3A and MAV vehicles at both plazas (TP1 and TP2) show a consistent drop since FY21. Historical overloading shares show large variations due to exogenous impacts - local authority restrictions leading to the drops in overloaded traffic from Jan-18 to Jul-18 and Jul-19; monsoons; repair works of Farakka Barrage and COVID-19.

3.28 Overloaded MAV traffic at both plazas as of FY26YTD has observed growth over FY25 levels. Between FY22 and FY24, the share of overloaded vehicles observed on the Asset was low due to the strict enforcement of government restrictions on overloaded vehicles across the state. This trend showed signs of abatement late FY24 onwards as non-compliance increased. In September 2024, the Federation of West Bengal Truck

Operators Association (WBTOA) called for a three-day strike[11] demanding stronger enforcement across the state. As a result, the Asset observed a drop in the share of overloaded commercial traffic briefly during that time. However, as time progressed, the share of overloaded vehicles continued to increase with January 2025 observing 7.8% overloaded MAVs relative to 1.5% observed the previous year (January 2024). The table above present historical growth in the share of overloaded 3As and MAVs at both plazas on the Asset.

3.29 In our forecasting models, to avoid high variability in overloading revenues going forward, and to reflect the assumption that growth in overloaded vehicles will not sustain, we have assumed overloading to remain constant at the average shares (by vehicle category at both plazas) observed over the period Apr-Feb '26. Any increase in overloading from current levels will be an upside on revenue on this Asset.

3.30 Historically, overloaded vehicles were charged a flat nine-times penalty of the Single fee for the vehicle type, on the Asset. However, based on an NHAI circular[12] dated 25 September 2018, the Client has been charging overloading penalties as per the staggered penalty system presented in Table 3.9 below. It is important to note that as per the information available 75% of the overloaded revenue is allocated to the old Concessionaire[13] and 25% of the overloaded revenue will be allocated to the new concessionaire.

Table 3-9: Overloading penalties on Asset

Percentage of excess load over Maximum Permissible Gross Vehicular Weight	Multiplying factor to Single rate of fees (including normal fees)	Penalty
0% to 20%	2	Single fee multiplied by multiplying factor
>20% to 40%	4	
>40% to 60%	6	
>60% to 80%	8	
>80% and above	10	

Source: NHAI circular [F. No. H-25016/1/2018-Toll]

3.34 Aside from the NHAI rules on overloading and penalties for the same, the local administration around the Asset has introduced bans on overloading at various times and lifted them later in the history of the Asset's operation. This reflects in the swinging shares of overloading observed on the Asset. As changes in the ability to overload change the number of trucks required to operate a certain payload, we observe associated swings in truck volumes as well during these periods. We discuss this in further detail in Chapter 6.

[11] **West Bengal truckers announce 72-hour strike over overloading and illegal fees | Kolkata News - Times of India**

[12] NHAI circular numbered F. No. H-25016/1/2018-Toll

[13] HCC is the old Concessionaire and the Client is the new Concessionaire

Data Collection exercise

3.35 As aforementioned, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed in Table 3.11 below. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.11: Data collection schedule

Toll Plaza	3-day videography based TVC			1-day OD survey	
	Start date	End date	Time (hrs)	Start date	Start time
TP1	4th Mar 2026	6th Mar 2026	00:00-23:59	6th Mar 2026	0900 hours
TP2	6th Mar 2026	9th Mar 2026	0000-2359	10th Mar 2026	0900 hours

Source: Steer analysis

3.36 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, in order to fully understand the impact of this weekly fluctuation on the Asset, we had collected seven-day counts at each toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.37 Taking an average of the TVC counts, we obtained the following weekly average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicle such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicle, government vehicle and other vehicle types officially allowed as 'exempted' under the concession agreement.

3.38 As presented in Table 3.12 below, CJVs are largest vehicle category at TP1 (3,716), closely followed by MAVs at 6,662. However, at TP2, CJVs are the largest vehicle category (6,934), followed by MAVs 5,679. Lower truck volumes at TP1 and TP2 can be attributed to ongoing economic slowdown in Bangladesh. TP1 being closer to Bangladesh border Mahadipur observes heavy export items of stone chips/aggregate carried to Bangladesh. However, with the economic slowdown and reduced exports, total traffic has reduced on both plazas reflecting lower growth. Higher CJV volumes at TP2 is due to its proximity to more urban and densely populated town of Malda (as compared to Farakka for TP1).

Table 3.12: WADT from TVC counts

Toll Plaza	CJV/Mini LCV	LCV	Bus/2A	3A/MAV	Total
TP1 Lakshmipur	3,716	1,229	1,136	6,662	**12,743**
TP2 Gazole	6,934	1,430	1,657	5,679	**15,701**

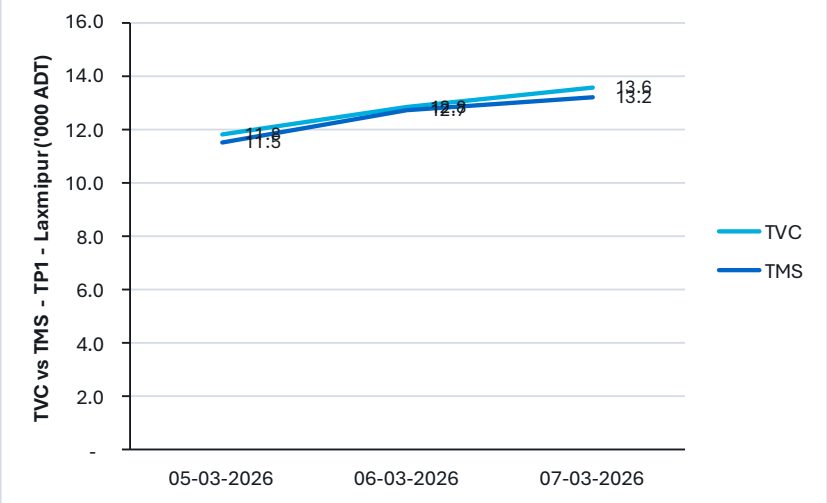
Source: Steer analysis

TVC v/s TMS analysis

3.39 We used our TVC data to validate the toll plaza data for the same days, as supplied by the Client via their toll management system (TMS). This TMS data was then used as the base data, for our forecasting model.

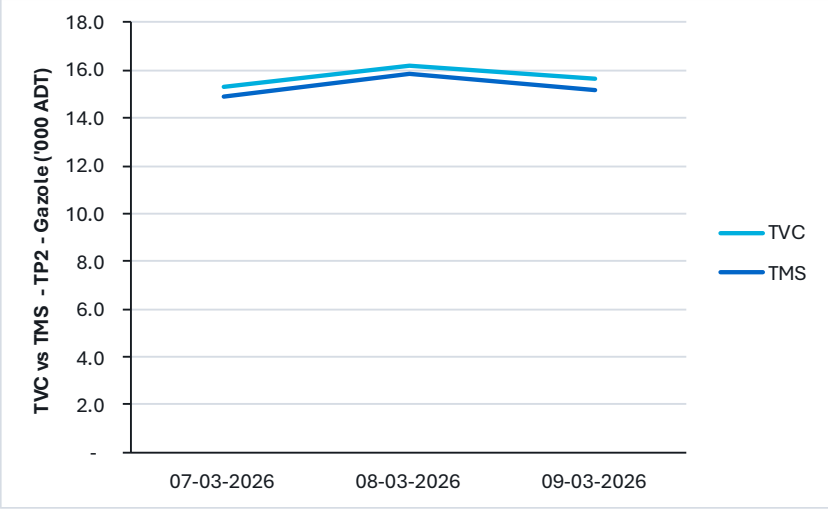
3.40 The following figures show the comparison between the daily traffic observed by TVC and TMS for the two toll plazas.

Figure 3.5: Comparison between TVC and TMS daily traffic data, TP1 Lakshmipur



Source: Steer analysis of TVC and Client TMS data

Figure 3.6: Comparison between TVC and TMS daily traffic data, TP2 Gazole

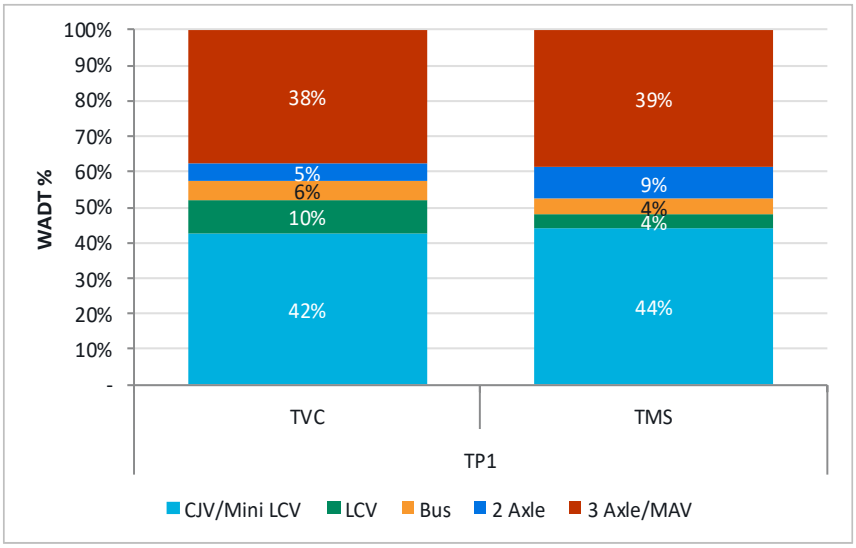


Source: Steer analysis of TVC and Client TMS data

3.41 Figure 3.5 through Figure 3.8 show the comparison between daily traffic data and shares of vehicle categories in TVC and TMS for the two toll plazas. As presented in Figure 3.5 and Figure 3.6 above, the difference between daily traffic from both sources is minimal at both TP1 and TP2. However, in both cases, the TVC is ~2% higher than the TMS across the week. These differences can be attributed to technical differences between the two independent traffic counting systems.

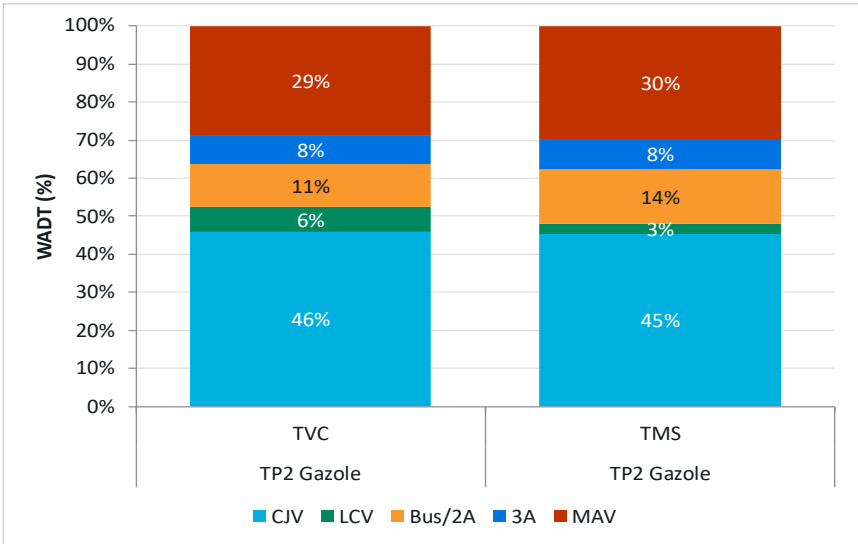
3.42 Further, Figure 3.7 and Figure 3.8 below compare the shares of vehicle types at both plazas, between TVC and TMS data. As seen below, there is a good fit between TVC and TMS data in terms of proportions, except for LCV and Buses/2A. However, as we have observed in several toll roads across the country, this can be attributed to classification differences in different counting systems, especially as often observed for LCV and Buses/2A.

Figure 3.7: Comparison between vehicle shares from TVC and TMS WADTs for TP1



Source: Steer analysis of TVC and client TMS data

Figure 3.8: Comparison between vehicle shares from TVC and TMS WADTs for TP2



Source: Steer analysis of TVC and client TMS data

3.43 Upon combining vehicle categories into two super-categories (light and heavy vehicles), we see that for light vehicles (including CJV, LCV, 2A and Buses), the difference comes down to about 6% and 3% at TP1 and TP2 respectively. Heavy vehicles comprising 3A and MAVs show minimal differences at less than 2%. Given this, we believe the base year traffic calculated using the Client TMS data forms a reasonable estimate.

Key findings of origin-destination analysis

Overview

3.44 Origin-destination (OD) analysis enables us to understand the nature of traffic movement on the Asset. The OD analysis presented here is based on data collected on behalf of the Client in July 2023 and March 2026. More recent OD surveys were not undertaken as this Asset has a long operational history and we did not believe material changes in these patterns would have occurred in this period.

3.45 We have analysed the regional drivers of demand based on the following analyses:

Zonal influence
Commodity distribution
Top OD pairs
Trip length distribution

3.46 While zonal analysis and list of top OD pairs help us to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.47 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TVC data) during the same period. Table 3.13 below presents the sample rates for key vehicle type aggregations at both the toll plazas. We believe that the sample rates of the OD data are reasonable.

Table 3.13: Sample rates for OD data

Vehicle type	TP1 Lakshmipur	TP2 Gazole
Passenger (CJV + Bus)	69%	49%
Goods (LCV+ 2A + 3A + MAV)	59%	51%

Source: Steer analysis of OD data

Zone categories

3.48 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states, and regions in the vicinity of the Asset, we have aggregated zonal data as described in the following table.

Table 3.14: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	On or very close to the Asset.
Immediate area of influence (IAOI)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)

Aggregate Zone	Description
Odisha	All the trips that originate or end in the neighbouring state of Odisha
Bihar	Bihar
Northeast India	Northeast Indian states
Chhattisgarh	Chhattisgarh
Jharkhand	Jharkhand
Madhya Pradesh	Madhya Pradesh
West India	Rajasthan, Gujarat
Maharashtra	Maharashtra (including Mumbai)
North India	Uttarakhand, Jammu and Kashmir, Delhi NCR, Uttar Pradesh, Punjab
South India	Andhra Pradesh, Tamil Nadu, Karnataka, Kerala
Rest of India	Rest of Indian states.
Outside India	Nepal, Bhutan, Bangladesh.

Source: Steer analysis

Zonal influence

3.49 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence[14] at each toll plaza of each Asset, aggregated based on zonal aggregation listed in the previous sub-section. Please note that zonal influence is analysed on trip ends and not trips.

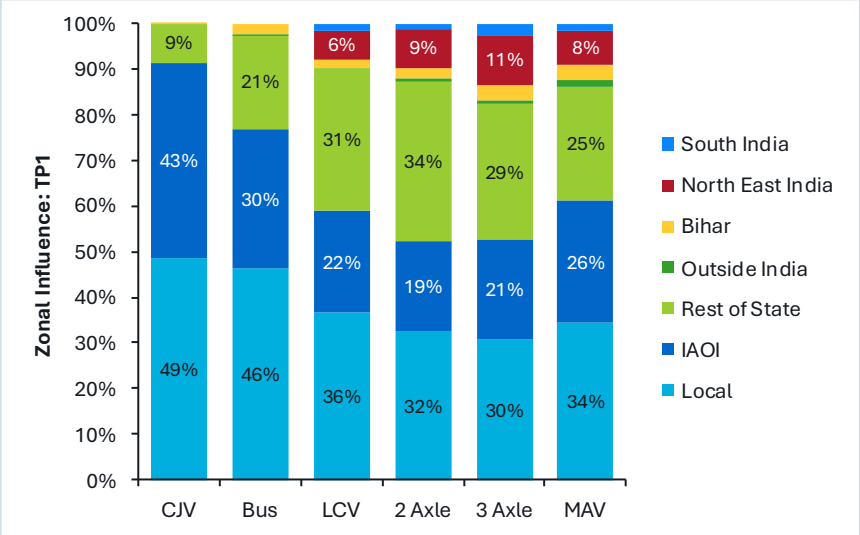
3.50 Figure 3.9 and Figure 3.10 below presents the zonal influence of different regions on all types of vehicular traffic observe at each of the toll plazas. We can see that 'Local' trips consistently account for the largest share of trips across all vehicle types. This follows from the earlier observation of the high share of 'return' trips observed at both plazas on the Asset. We observe the highest share of Local trips for CJVs (49% at TP1, and 58% at TP2). Trips between Farakka and Malda are the largest contributor to the CJV traffic on TP1, whereas Malda and Gazole contribute to almost 36% of the total CJV trips at TP2.

3.51 In case of 3A/MAVs too, we see a very high share of Local trips at 34% and 31% respectively, at TP1 and TP2. Rest of West Bengal contributes to about 25% of traffic volume. The trip ends with highest zonal influence for 3A/MAV on the Asset are Farakka, Raiganj, Kolkata and Darjeeling, with each of these contributing to about 10-15% of the total trips on the Asset. The state's influence including local and IAOI and rest of state is more than 80% in MAVs on both toll plazas.

3.52 Other contributors are North-east India with about 7-11% share in 3A/MAV vehicles and South India with about 2-3% share in 3A/MAV category.

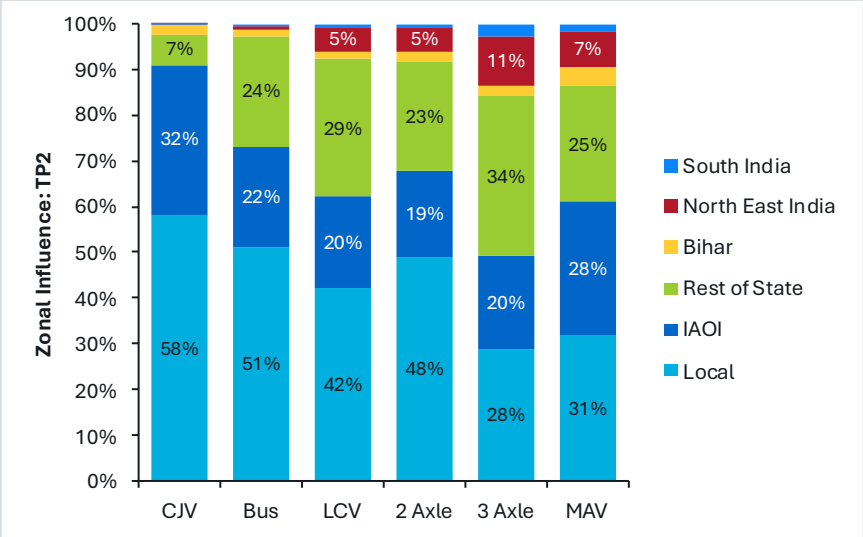
[14] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad is 50% since one trip end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Figure 3.9: Zonal influence, TP1 Lakshmipur



Source: Steer analysis of OD data

Figure 3.10: Zonal influence, TP2 Gazole



Source: Steer analysis of OD data

Internal External analysis

3.53 Internal-External analysis helps in identifying the trips which have both the origin and destination on or near the Asset i.e., local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). RoS (Rest of State) here represents areas within the state which are neither local nor IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e. lying on the Asset, while 'External' zones are areas lying outside the state. The graphs below show the distribution of trips based on these categories. These reflect observations from the zonal influence analysis presented earlier, except at a higher level of aggregation and at a trip level.

3.54 As evidenced in Figure 3.11 and Figure 3.12 below, a significant share of trips with one end in internal zone is observed across all vehicle categories at both toll plazas due to significant generators of economic activity like Pakur located relatively near the Asset. The share of E-E movements in heavy goods vehicles is also low, reflecting the local/regional nature of the movements facilitated by the Asset.

Figure 3.11: Internal-External distribution, TP1 Lakshmipur

	Internal	Rest of State	External
External	17%	8%	14%
Rest of State	10%	6%	13%
Internal	9%	8%	17%

Source: Steer analysis of OD data

Figure 3.12: Internal-External distribution, TP2 Gazole

	Internal	Rest of State	External
External	16%	10%	19%
Rest of State	7%	7%	12%
Internal	11%	5%	12%

Source: Steer analysis of OD data

Commodity distribution

3.55 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in Table 3.4 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.15: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Livestock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN

Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, Household items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

3.56 Figure 3.13 and Figure 3.14 below show the commodity distribution at each toll plaza, at the total level. The commodity distribution for goods vehicles, indicates the importance of stone quarries and crushers in the immediate vicinity of the Asset; about 27% of MAVs carry construction material, primarily stones and aggregates at TP1 Lakshmipur. Based on the analysis of the OD movements of the CNS category, we observe the movement of stone and other building material originating from the nearby towns of Pakur and Nalhati to the Bangladesh border and parts of North Bengal.

3.57 5% of the MAVs carry agricultural and grocery products at TP1 Lakshmipur. These trips are generally between agricultural areas of northern West Bengal, including tea plantations in

Darjeeling, and large urban consumption centres like Kolkata and cities in the southern states.

3.58 The share of empty vehicles is high at 35% and 38% for MAVs at TP1 and TP2 respectively. This is mainly due to the high share of trucks carrying aggregate material at TP1, which tend to return empty in the other direction. We also observe a 6-8% of share of petroleum-related products in MAVs across both plazas. The remaining commodities are a heterogeneous mix, comprising of machinery, automobile, cotton, jute, petroleum products and containers.

Figure 3.13: Commodity distribution, TP1 Lakshmipur (Total)

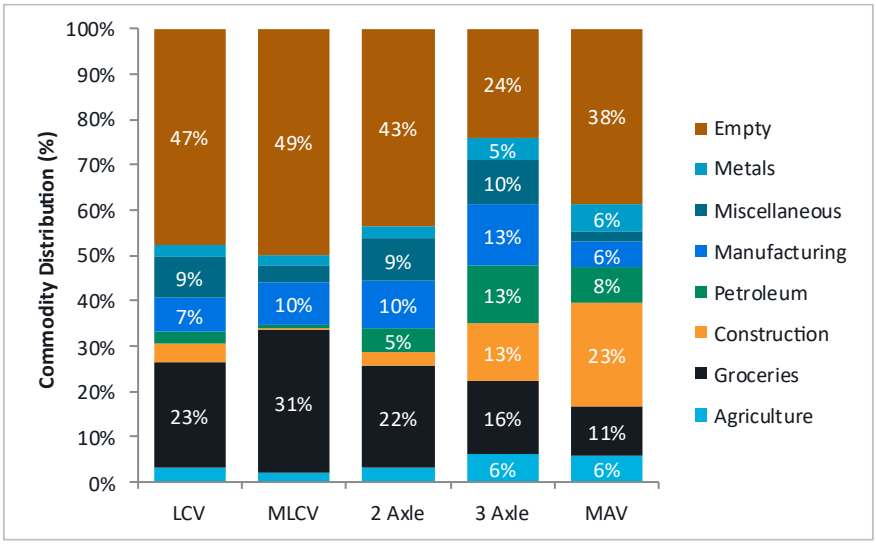
Figure 3.14: Commodity distribution, TP2 Gazole (Total)



Source: Steer analysis of OD data

Trip length analysis

3.59 Trip-length distribution provides us the distance-based profile of various vehicle types. This helps to validate our assumptions on the influence of macro-economic variables on

traffic growth on the Asset, as well as our outputs from the zonal influence and toll segmentation analyses. For ease of interpretation, we have categorised distances into 5 groups — local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[15]

3.60 Traffic on the project road is primarily commercial traffic carrying goods to/from different parts of the state of West Bengal, the north-eastern states, adjoining western states (Bihar and Jharkhand) and some southern states (such as Andhra Pradesh and Tamil Nadu). In addition, a significant proportion of this commercial traffic is cross-border (into/out of Bangladesh) and a small share of traffic carries goods to Nepal and Bhutan.

3.61 Travel patterns of vehicles crossing both the Asset plazas are also dependent on various factors including local market conditions for stone chips and aggregates as well as external demand for the same in Bangladesh. After consultations with local truckers, toll plaza managers and other stakeholders during our site visit, we noted that demand for Pakur stone in West Bengal is weaker that it is in Northeast India. To support this, we reviewed the outputs of our trip length analysis from the OD surveys conducted at both the plazas (as shown in Figure 3.15 and Figure 3.16 below), and found that there was a marked difference in the trip lengths observed at both the plazas.

3.62 At TP1, we find that the trip lengths are more evenly distributed, where the majority of 3A trips (~61%) are short-medium distance (<500 km), and MAVs also show a similar distribution where the proportion of trips shorter than 500 km is high (~71%).

3.63 Generally, smaller vehicles have shorter-distance trips as compared to goods-carrying heavy vehicles, but in case of TP2, we see that trips distances in the range of 100-300 km are most common. These trips pre-dominantly constitute movements between stone-mining sites in the Pakur region and the India-Bangladesh border-crossing site at Mahadipur, as well as sand-distribution hubs located near Malda.

3.64 MAVs have a considerable share at 15% and 16% respectively at TP1 and TP2, of vehicles undertaking long-distance trips covering more than 500 km but less than 1000 km. Share of vehicles undertaking very long-distance trips of greater than 1000 km, including those with trip ends in the southern states, is 14% at TP1 and 13% at TP2, respectively.

[15] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Figure 3.15: Trip length distribution, TP1 Lakshmipur

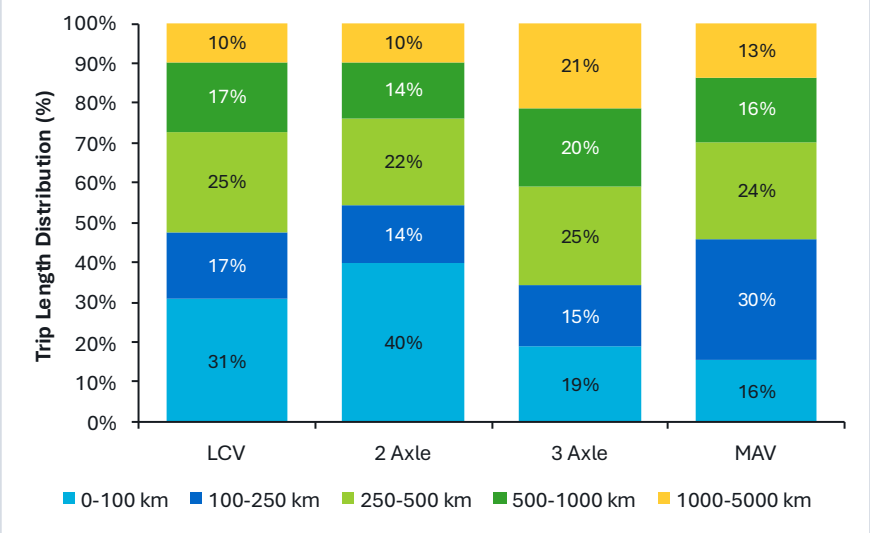
Figure 3.16: Trip length distribution, TP2 Gazole



Source: Steer analysis of OD data

Conclusions

3.65 The historical traffic trends reveal that over the period FY18 to FY26, both toll plazas have observed growth. Over this period, TP1 Lakshmipur's total AADT grew by CAGR of 2.6% and PCU grew by CAGR of 1.9%, while the corresponding growth for TP2 Gazole were 4.6% and 3.6%, respectively.

3.66 When considering ticket segmentation, return tickets remain the dominant category at both plazas in terms of CJV traffic. The introduction of annual passes for CJVs in August 2025 has led to a fall in return shares from 58% to 51% at TP1 and 64% to 59% at TP2.

3.67 The TVC counts show minimal variation from the TMS data; at the total level, TVC counts were ~2% higher than TMS counts at TP1 and TP2. The difference in the vehicle shares of the two dominant categories, CJVs and MAVs, is also minimal.

3.68 The OD analysis found that in terms of zonal influence, 'Local' trips make up the largest share for all vehicle types. This follows from the earlier observation of the high share of 'return' trips across all vehicle categories. Local + IAOI trips make up 60% of the MAV share at TP1 and 59% at TP2, corroborating the trends observed in the ticket segmentation.

3.69 The commodity distribution analysis highlights the Asset's vicinity to stone quarries and crushers (and their consequent influence on the Asset), with construction materials accounting for 27% and 23% of commodities carried by MAVs at TP1 and TP2 respectively. Agricultural products and groceries also accounted for a considerable share of total commodities carried at both plazas. TP1 and TP2 has a high share of empty goods vehicles (35-38%) and can be attributed to the high share of trucks carrying stone chips/aggregate material at TP1 in one direction and return empty in the opposite direction.

3.70 When considering the internal and external distribution, internal trips are dominant at both plazas for all vehicle categories. It is important to note from the zonal influence analysis that through trips observed at both plazas are not very long distance, and are primarily IAOI trips. The trip length analysis outputs support this, with the dominant trip length across all vehicle categories being shorter distance trips (<500km) specially at TP2.

4 Socio-economic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

Changes in factors such as population, economic growth (regional and national) and industrial production; and,

Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available.

4.3 In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in the state of West Bengal where the Asset is located.

National Level

4.5 Table 4.1 below shows that the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.6 Table 4.2 below shows the historical population growth in the state of West Bengal compared to national population growth. Overall, the population of West Bengal has grown at a slower rate than observed across the country; between FY12 and FY24, the state's population grew at a CAGR of 0.7% per year, while the corresponding growth for the country was 1.2% per year.

Table 4.2: Population Growth in West Bengal and India (2012 – 2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
West Bengal	91.8	99.3	0.7%
India	1210	1395	1.2%

Source: MoSPI estimates

4.7 Due to the complexities of urbanisation, and the dynamic nature of local population migration (both of which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

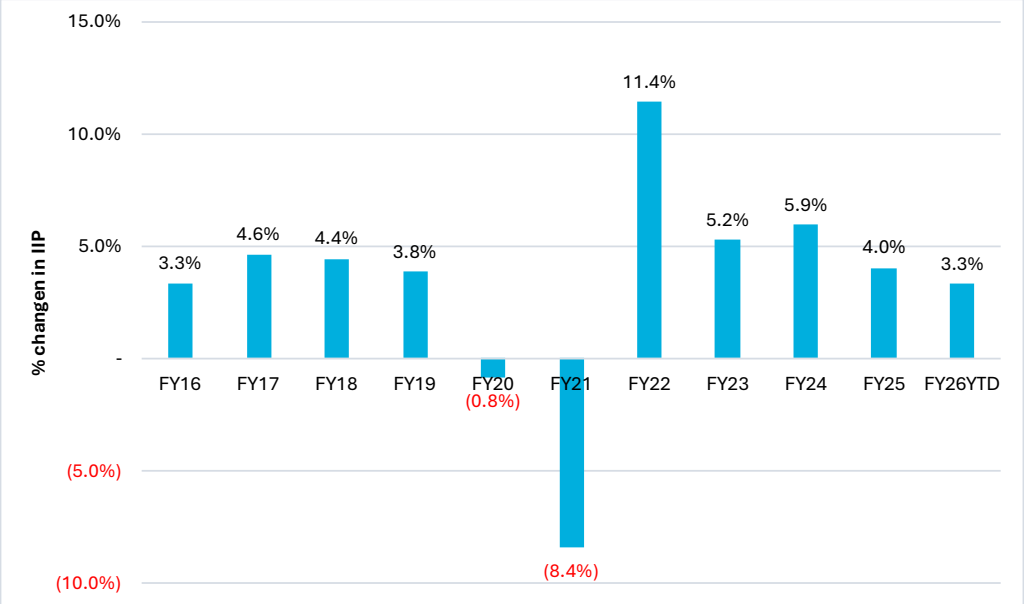
Economic Indicators

Industrial Production

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 The figure below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4%, and FY26YTD (till February 2026) recording 3.3% growth over FY25

Figure 4.1: Annual growth – Index of Industrial Production (FY16-FY26YTD)



Source: Ministry of Statistics and Program Implementation (MoSPI). FY26YTD represents data till Feb'26

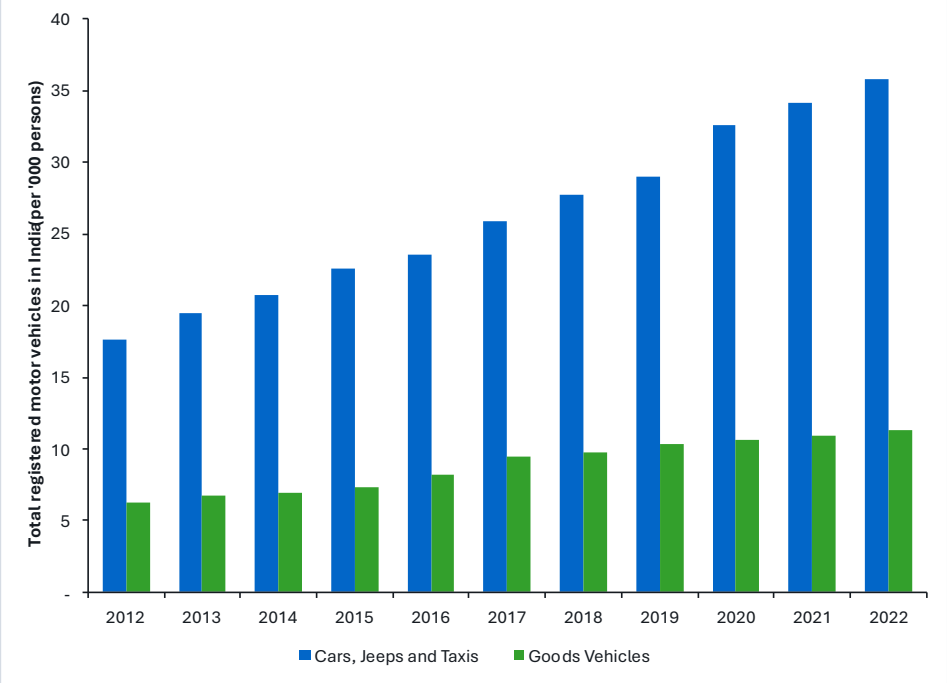
4.10 Since state-level IIP data is not as readily available as national-level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MoSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle Ownership

4.11 The gap in car ownership between India and developed nations remains substantial – with 36 cars/jeeps/taxis and 11 commercial vehicles per thousand people, as of FY22 (the latest year for which official data is available). However, with increasing per capita income levels, a booming economy and the subsequent increase in demand for mobility, the number of registered vehicles has been on a gradual upward trend

4.12 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. Between FY12 and FY22, the CAGR for CJV and goods' vehicles registered in India was 8.6% and 7.3% respectively

Figure 4.2: Total number of registered motor vehicles in India (per 1000 population



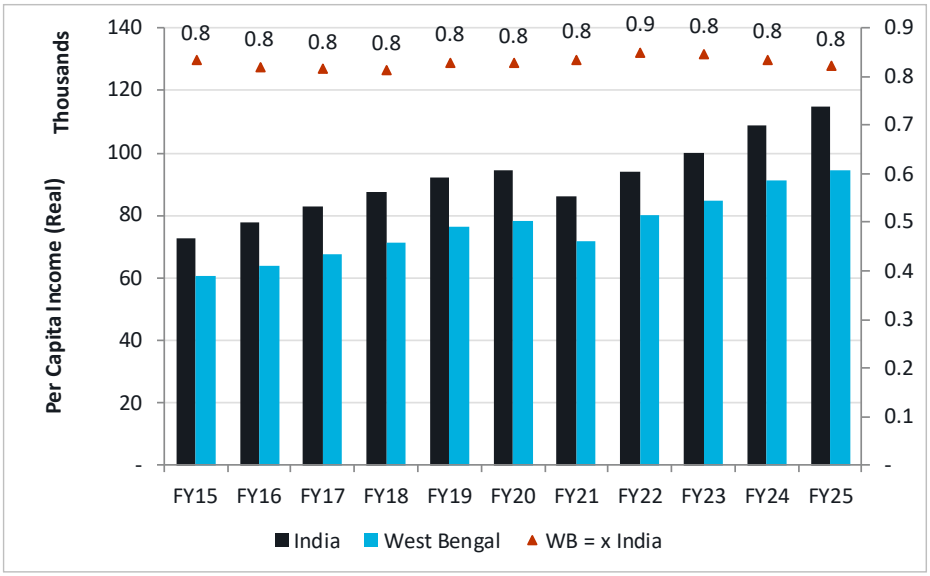
Source: Ministry of Road Transport and Highways (MoRTH)

Per Capita Income (PCI)

4.13 As shown in Figure 4.3 below, the per capita income of the state where the Asset lies, i.e., West Bengal, has historical been lower than the national average, and has been at about 80% of the national level over the past few years. During the period 2015-2025, India's average PCI has grown at a rate of 4.7% whereas that of West Bengal has grown at rate of 4.5%.

4.14 Though lower than the national average, per capita incomes have grown at about 4.0% per year between FY15 and FY24 - consistent with national trends over the same period.

Figure 4.3: Historical Growth in Per Capita Incomes – West Bengal vs. India (FY15-FY25)



Source: Ministry of Statistics and Program Implementation (MoSPI)

4.15 Given the difficulty in obtaining granular district level PCI data, it is not advisable to use this as a growth driver in our forecasts. Additionally, long-term forecasts for PCI are not available from official sources and we therefore refrain from using it to forecast traffic growth.

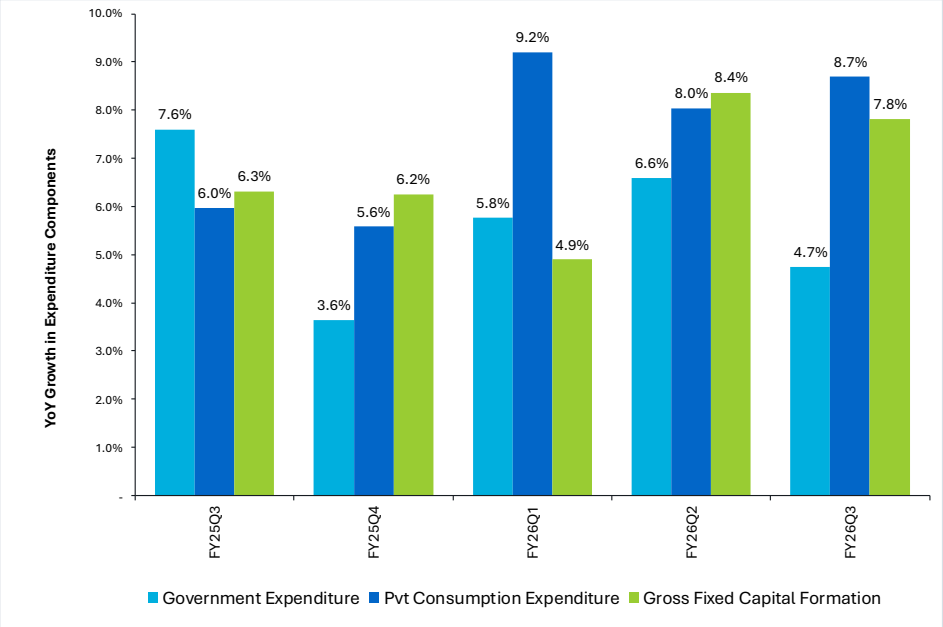
Economic growth

India's Performance

4.16 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q3 GDP at 7.8% over FY25Q3. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[16].

4.17 The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past year (FY25Q3-FY26Q3).

Figure 4.4: YoY growth in expenditure components of GDP



Source: Steer Analysis of MOSPI Data

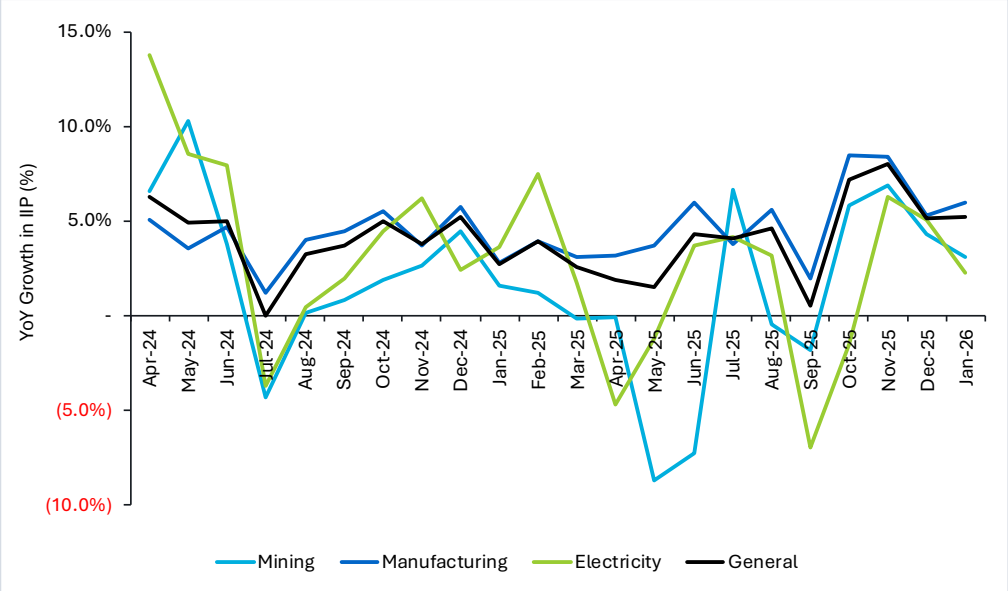
4.18 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 5.8% growth over FY25Q1 levels.

4.19 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume

[16] Gov**ernment of India PIB Release (27th February 2026)**

growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr'25-Feb '26), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

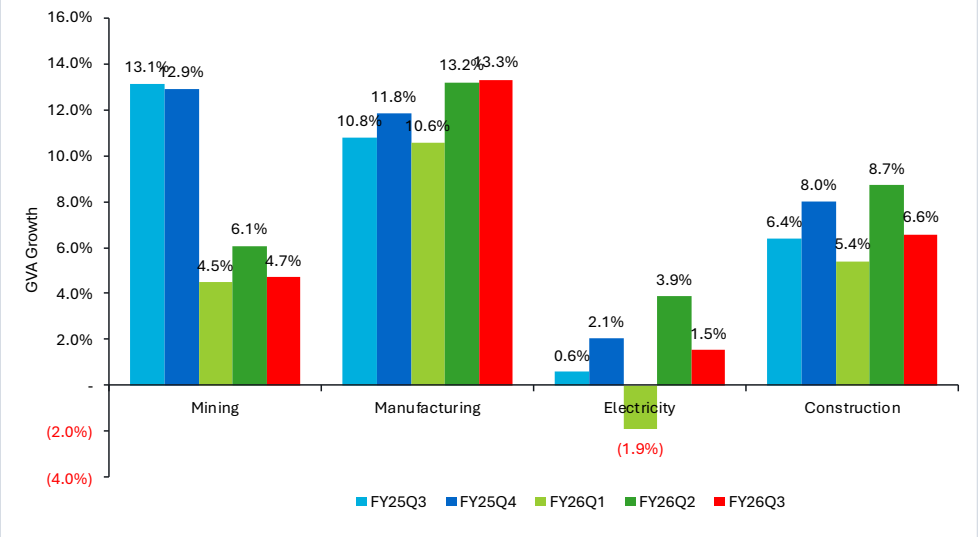
Figure 4.5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.20 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4.6: Industrial components of GVA



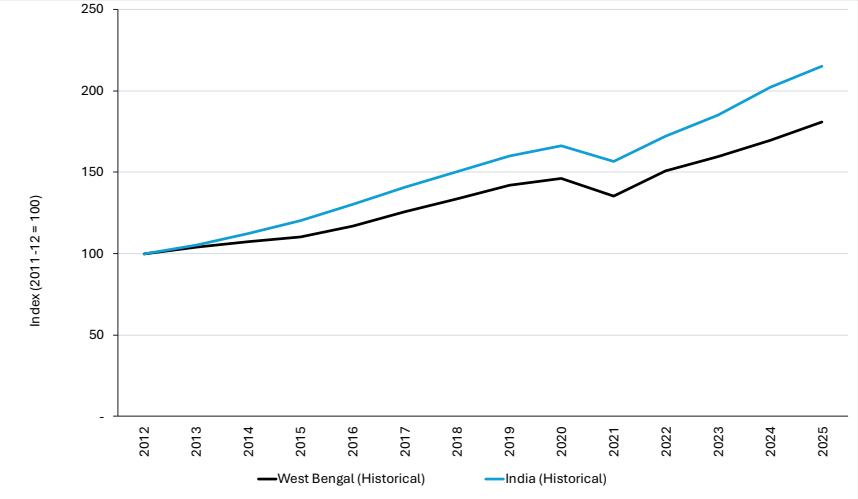
Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.21 Over the period FY12-FY24, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same period. Over the same period, economic growth of West Bengal has been slower than the country overall; between FY12-24, the state's GSDP grew at a 4.7% CAGR.

4.22 The state contributes approximately 5.1% to India's GDP, and has a 7.1% share in India's population in FY24. It is the fourth-most populated state in the country, with a population of 99.3 million in FY24. Figure 4.7 below shows historical growth in West Bengal GSDP compared to India GDP.

Figure 4.7: Evolution of West Bengal's state GDP and national GDP, FY12-25



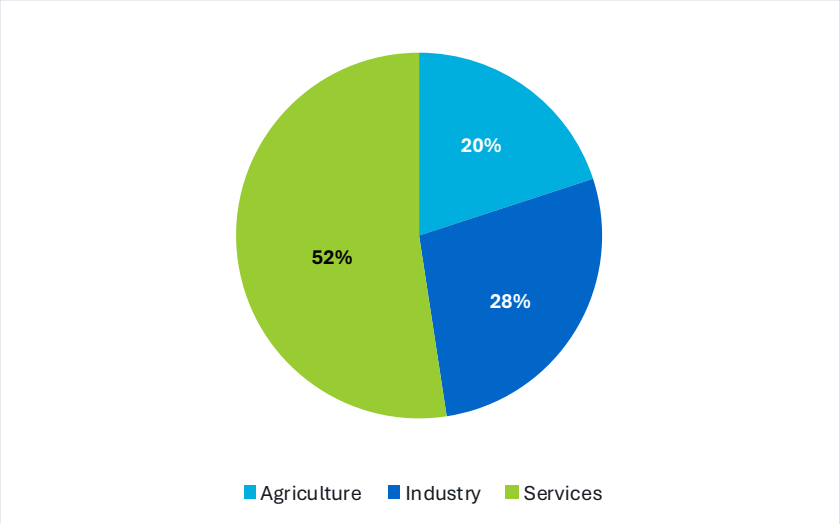
Source: Ministry of Statistics and Program Implementation (MoSPI)

4.23 As can be seen in Figure 4.8, the state economy is largely driven by the tertiary sector which contributed approximately 52% to state GSVA as of FY24.[17] The tertiary sector is followed by the secondary and primary sectors, which account for 28% and 20% of statewide GSDP (respectively).

4.24 Within the secondary/industrial sector, Chittaranjan, Dankuni, Kharagpur (railway locomotive manufacturing), Haldia (petrochemical) and Durgapur (steel and iron ore) constitute the key industrial regions within the state. The state is also home to the Shyama Prasad Mookherjee Port – one of the 12 major ports under the aegis of the Government of India, and an Indian Oil Corporation's refinery at Haldia.

4.25 The key primary industries in the state include agro and food processing and crop production. The state is mainly known for production of tea (in Darjeeling and Jalpaiguri) and rice.

Figure 4.8: Sectoral contribution to West Bengal's GSDP in FY25



Source: Ministry of Statistics and Program Implementation

4.26 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI). The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[18], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP, and develop GSDP forecasts as a function of our assumed GDP forecasts[19].

4.27 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth

[17] **GSVA/NSVA by economic activities | Ministry of Statistics and Program Implementation | Government Of India**

[18] **Consensus Economics - Economic Forecasts and Indicators**

[19] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.28 Following the discussion in Chapter 4 on the nature of economic activity in the state of Uttar Pradesh and in Delhi, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.29 We have based our forecasts of West Bengal GSDP using forecasts of GDP provided by the Client.

National GDP

4.30 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[20]

4.31 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24.

4.32 Figure 4.9 below shows Client-provided GDP projections for India. The forecast provided expects the Indian GDP to grow at 6.5% between FY27-FY28 and gradually tapering down to 5.2% by FY50. The India GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI in the medium term.

[20] **Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu** (September 2020)

Figure 4.9: GDP-GSDP forecast

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this chapter, we present our approach, assumptions and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 To understand historical traffic trends observed on the Asset in relation to these underlying growth drivers, we carry out regression analyses to determine the historical relationship between traffic growth (by vehicle category) and the underlying macroeconomic driver assumed to influence its growth on the Asset. The dynamics of traffic demand is the dependent variable while the dynamics of one or more identified growth drivers are the independent or explanatory variables.

5.4 Typically, passenger and light commercial vehicle traffic like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state in which the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because most light vehicles tend to travel shorter distances within the state, whereas heavy vehicles typically carry commodities over long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth than more local or regional growth drivers.

FY26 Base year AADT estimates

5.5 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. For this traffic study, we have used FY26 as the base year for generating or future year traffic forecasts for the Asset.

5.6 To establish the base year (FY26) traffic position, we utilised information from various sources including historical traffic data from the Client (FY25 and FY26YTD), latest information on FY26 estimated GDP and GSDP growth (as published by official sources), as well as our own contextual knowledge of the region and wider economy, and transportation network the Asset forms a part of.

Methodology

The base traffic for FY26 has been estimated using 11 months of actual traffic data (April to February). Each toll plaza's seasonality correction factors were applied on the actual MADTs of Apr-25 to Feb-26 to obtain seasonally corrected estimates for FY26 traffic. An average of these estimates was considered to be the FY26 base traffic.

Seasonal Correction Factors

5.7 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. E.g., it is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affect the freight movement patterns in large parts of the country in the July-September period. In addition to these, there may be other seasonal variations specific to the Asset.

5.8 To normalise for these variations across the year when estimating AADT, Seasonality Correction Factors (SCFs) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF greater than one implies that the traffic for that month is lower than the annual average and vice-versa.

5.9 Table 5.1 and Table 5.2 below present the average of FY23, FY24, and FY25 SCFs, used for the estimation of our FY26 base traffic position.

Table 5.1: Adopted SCF for the Asset for TP1 Lakshmipur

Source: Steer analysis: FY25 actual full year, FY26YTD includes 11 months of FY26, FY26A is adopted base for FY26

5.11 The tables above show that PCU growth from the full year FY25 AADT to the FY26A has been 2.2% at TP1 and 7.9% at TP2. Across all vehicle categories, we observed modest growth in FY26A, relative to FY25. LCVs observed a healthy growth in FY26 owing to stronger consumption trends in local areas near the Asset. Buses have observed muted growth; this could be attributed to shifting preferences towards personal mobility reflected in growth of CJVs.

5.12 For 3A/MAVs the muted growth trends are a result of two major factors - (1) continued decline in trade exports to Bangladesh, and (2) crackdown on illegal stone mining in Pakur District and other quarrying districts of Bengal, explained in more detail in Chapter 2 above and Chapter 6 below.

Estimation of background elasticities

5.13 Elasticities, in the case of traffic growth, are the relationships between traffic growth and the growth of underlying macro-economic drivers of traffic. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide the forecasts of background traffic growth.

5.14 The TMS data for the Asset reports 3A and MAV separately along with Bus and 2A hence no further splits were required to understand the growth pattern of these vehicle categories. Following the brief note on historical trends provided in Chapter 3 above, we now delve deeper into the results of the historical growth analysis for each major vehicle type. Table 5.5 below shows the share of influence of each macroeconomic driver variable considered for estimating the background traffic growth of each vehicle category on the Asset.

Table 5.5: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP West Bengal
Car		100%
LCV		100%
Bus		100%
2A	100%	
3A	100%	
MAV	100%	

Source: Steer analysis of Client data

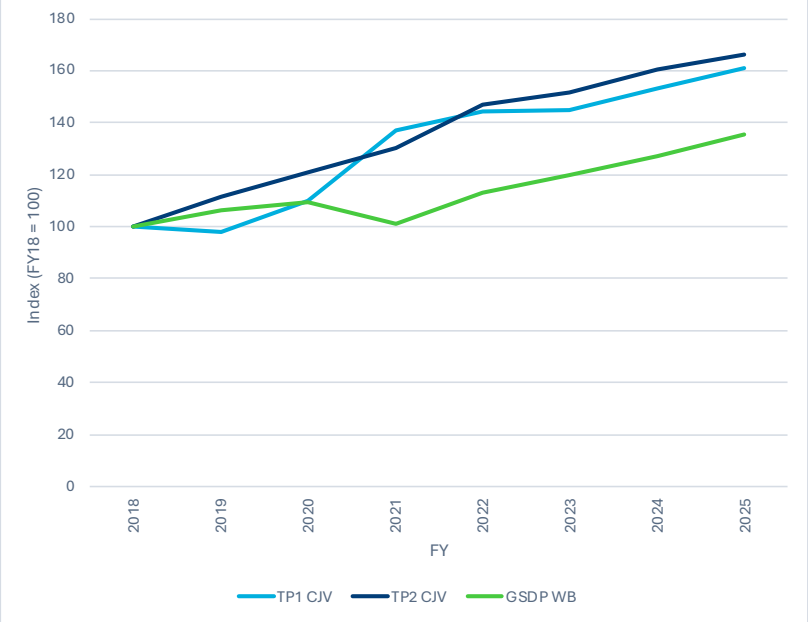
5.15 Since cars (CJVs), buses and LCVs cater to more regional movements (as validated from the OD trip lengths and zonal analyses above), growth of these vehicle categories are more influenced by regional economic drivers such West Bengal state GSDP. However, for 2As, 3As and MAVs that carry heavy commodities like construction material and agricultural products into West Bengal and Bangladesh, growth of these vehicle volumes on the Asset are more linked to nationwide GDP growth.

CJV

5.16 We see from the OD analysis (conducted in 2019 at TP2 and 2023 at TP1) that the CJVs primarily cater to regional movements between Farakka, Malda, Gazole, Raiganj and other towns lying on the Asset. We have therefore taken West Bengal GSDP to be the growth driver to model the growth of CJV traffic. Figure 5.1 below shows the relationship between the historical AADT CJV traffic on TP1 and TP2, over the period FY17 and FY24 and the GSDP of West Bengal.

5.17 Over the period FY18-25, CJV traffic at TP1 and TP2 grew at a CAGR of 7.0% and 7.5% per year respectively, while WB state GSDP grew at an average of 4.4% per year over the same period.

Figure 5.1: Relationship between CJV traffic GSDP of West Bengal – TP1 & TP2



Source: Steer analysis of Client TMS data and MoSPI data

5.18 Generally, we would expect that in fast-growing economies with relatively low car ownership levels, car traffic growth rates are often in line with or slightly higher than growth in GSDP/GDP (i.e. suggesting elasticities at or just above 1.0). Further, there is an expected increase in car ownership proportion of overall population as the economy grows. This assumption is however contextual and subject to changes in economic policies of government as well as overall regional economic conditions.

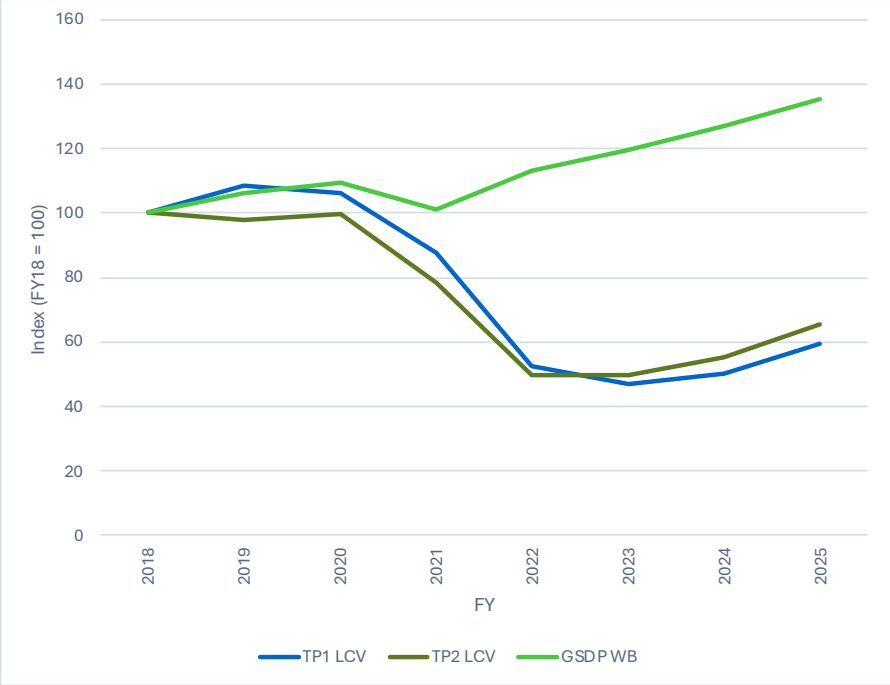
5.19 Considering the robust growth in CJV traffic observed over the operational history of the Asset, with trips largely between urban areas in and around the Asset, we have assumed a forecast background elasticity of 1.1 at TP1 and 1.0 at TP2 for CJVs, with respect to West Bengal GSDP. This is line with benchmarks we have observed at toll roads across the country, which have a considerable concentration of inter-urban areas.

LCV

5.20 Compared to heavy vehicles like 3A and MAV, LCVs on the Asset have more regional movements within the state, as observed in the OD data analysis (conducted in 2019 at TP2 and 2023 at TP1), where 70% of LCVs have one end of their trips within West Bengal. Hence, we have taken GSDP West Bengal as the growth driver for LCV.

5.21 Post FY20, due a change in national axle-load norms, there was nationwide shift in truckers' preferences from using LCVs to 2A trucks to carry more tonnage in commodities. Additionally, after the complete implementation of FASTag, there has been a significant reclassification of LCVs as either CJVs or 2As. This has also contributed to the declining LCV volumes on the Asset – between FY21 and FY25, LCV traffic witnessed a degrowth of CAGR 7.1% at TP1 and CAGR 7.7% at TP2.

Figure 5.2: Relationship between LCV traffic and GSDP of West Bengal – TP1 & TP2



Source: Steer analysis of Client TMS data and MoSPI data

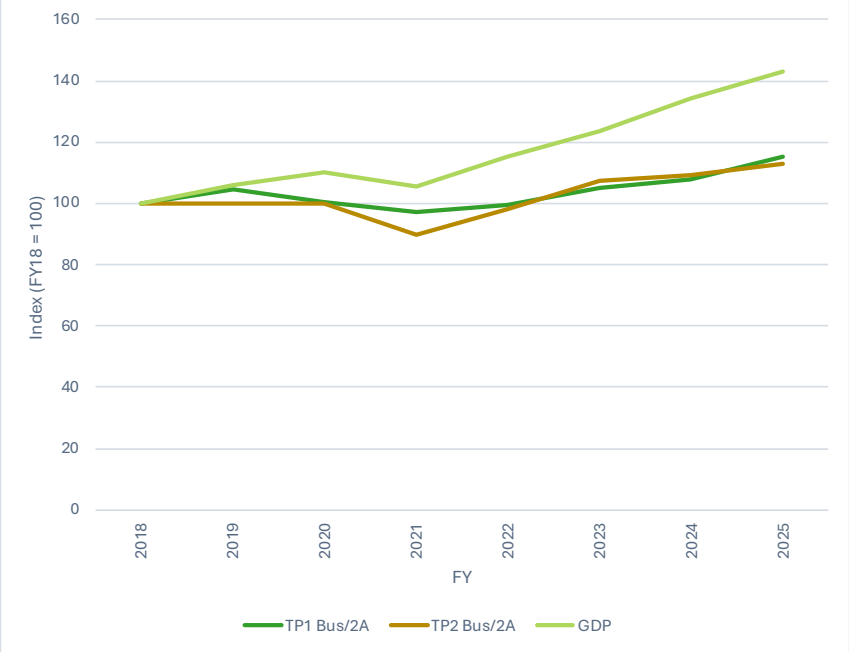
Bus and 2A

5.22 From FY22 onwards, Bus and 2A traffic were recorded separately, prior to which they were recorded together. Thus, given the limited period of three years (FY22-FY25) to understand the growth of Bus and 2A traffic trends separately we undertook regression analysis on the combined Bus and 2A traffic volumes. Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government during different intervals of time. Based on our experience across the country, buses on inter-urban and tourism corridors show elasticities of 0.4 to 0.6 with respect to the GSDP.

5.23 In the period of FY18-25, combined Bus and 2A traffic grew at a CAGR of 2.0% on TP1 and 1.8% on TP2, while WB state GSDP grew at an average 4.4% per year and national GDP grew at an average 4.8% per year over the same period. With its closer proximity to Malda town, Bus+2A volumes at TP2 are higher than observed at TP1.

5.24 As a result, for the purpose of forecasting traffic growth at both plazas, we have considered an elasticity of 0.25 for buses and 0.75 for 2As, at both toll plazas respectively.

Figure 5.3: Relationship between Bus and 2A traffic with GSDP West Bengal and GDP – TP1 & TP2

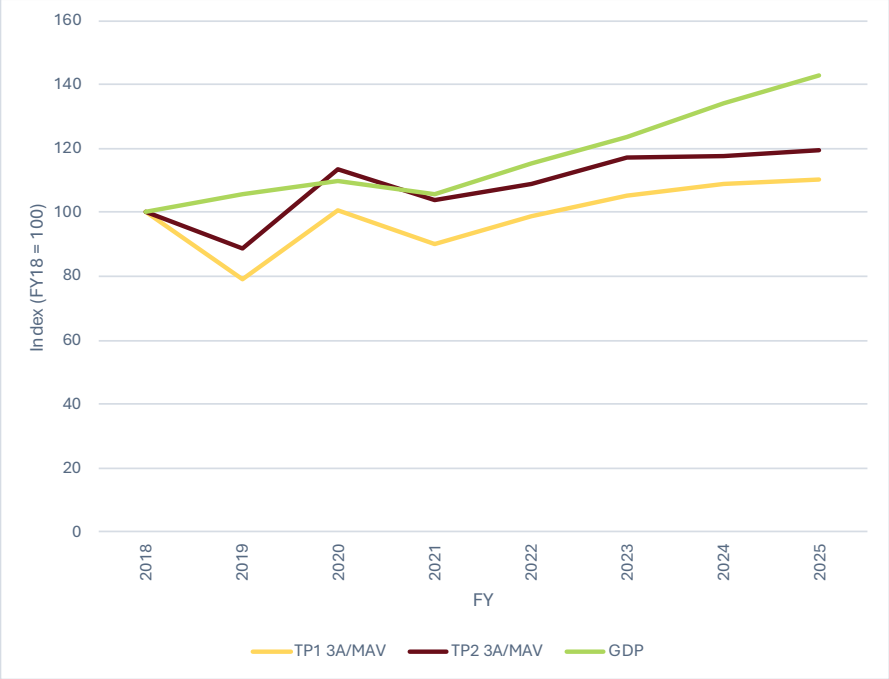


Source: Steer analysis of Client TMS data and MoSPI data

3A/MAV Trucks

5.25 Compared to lighter trucks like LCVs and 2As, 3As and MAVs have more national or long-distance movements covering several states. Given that manufacturing-related commodities typically take prominence in their commodity distributions, traffic growth of 3As and MAVs is more influenced by industrial demand-supply ecosystems spread across the country. For the purpose of forecasting 3A and MAV traffic growth on the Asset, we have used national GDP as the growth driver for 3A and MAV in our forecasting model. Figure 5.4 below presents the relationship between indexed values of 3A+MAV (combined) traffic volumes on the Asset and National GDP over the period FY18-25.

Figure 5.4: Relationship between 3A and MAV traffic with GSDP West Bengal and GDP – TP1 & TP2



Source: Steer analysis of Client TMS data and MoSPI data

5.26 As seen in Figure 5.4 above, 3A/MAV traffic at both toll plazas has seen consistent growth in the past years. Though late FY19 saw a big temporary drop in traffic due to the closure of the Farakka Barrage for six months, FY20 showed a strong recovery growth, before the start of the pandemic. Based on FY18-25 growth, TP1 shows 1.4% 3A+MAV growth while TP2 shows 2.6% MAV growth against GDP growth of 5.2%.

5.27 A slowdown in the Bangladesh economy over the past few years (FY23-FY26YTD) in addition to domestic policies to curb illegal stone mining across the country including parts of WB and JH from where stone chips/aggregate materials are transported via trucks on the Asset has resulted in muted 3A/MAV growth on the Asset (at both plazas) over the past couple of years (FY25 and FY26YTD).

5.28 In the combination of 3A+MAV, 3As have grown slower than MAVs due to a shift in axle preferences over the last several years, as truckers and transporters have continued to favour MAVs over 3As for long-distance movements since ~FY20. This is because MAVs have higher load capacity allowing transporters to enjoy economies of scale through lower per unit costs of moving material over longer distances when doing so through MAVs instead of 3-Axle trucks. It is however, unlikely that 3A truck volumes will reduce to zero as there are certain commodities or movements that remain best served by 3As.

Forecasts for background elasticities

5.29 Table 5.6 below presents a summary of our assumed forecast elasticities for background traffic growth in comparison to our derived elasticities from our regression analyses.

5.30 The forecast elasticities for buses and LCVs are projected to remain constant throughout the concession period. The elasticity for CJVs at TP1 Lakshmipur is reduced from FY30 onwards, while that of MAVs has been increased from FY27 to FY30- in view of the expected recovery of exports to Bangladesh - This assumption is grounded in historical

trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away. These trends are based on a long-term understanding of historical relationships and an overall outlook on the growth of the region and the country.

Table 5.6: Assumed forecast elasticities for background growth

Vehicle type	Growth driver	Derived Elasticity	Period Considered (Without Dummy)	Forecast	
				Assumed forecast elasticity	Evolution of elasticity
TP1 Lakshmipur					
Car	GSDP West Bengal	1.41	FY18-25	1.10	Reduced to 1.0 by FY30
LCV	GSDP West Bengal	0.80*	FY18-25	0.50	No change
Bus+2A	GSDP West Bengal	0.42	FY18-25	0.25 for Bus and 0.75 for 2A	No change
3A+MAV	GDP	0.62*	FY18-25	0.20 for 3A and 0.9 for MAV	No change
TP2 Gazole					
Car	GSDP West Bengal	1.50	FY18-25	1.00	No change
LCV	GSDP West Bengal	1.26	FY18-25	0.40	No change
Bus+2A	GSDP West Bengal	0.45	FY18-25	0.25 for Bus and 0.75 for 2A	No change
3A+MAV	GDP	0.60	FY18-25	0.30 for 3A and 0.9 for MAV	No change

Source: Steer analysis of Client data; *insignificant results; FY25 AADT used in to derive the elasticities via regression analyses was the actual FY25 AADT; The derived elasticities for the Bus + 2A models at both plazas are with respect to GSDP WB, whereas in the models, Buses are driven by WB GSDP while 2As are driven by National GDP (as per Table 5.5 above).

6 Forecast: Network overlays and forecasts

Introduction

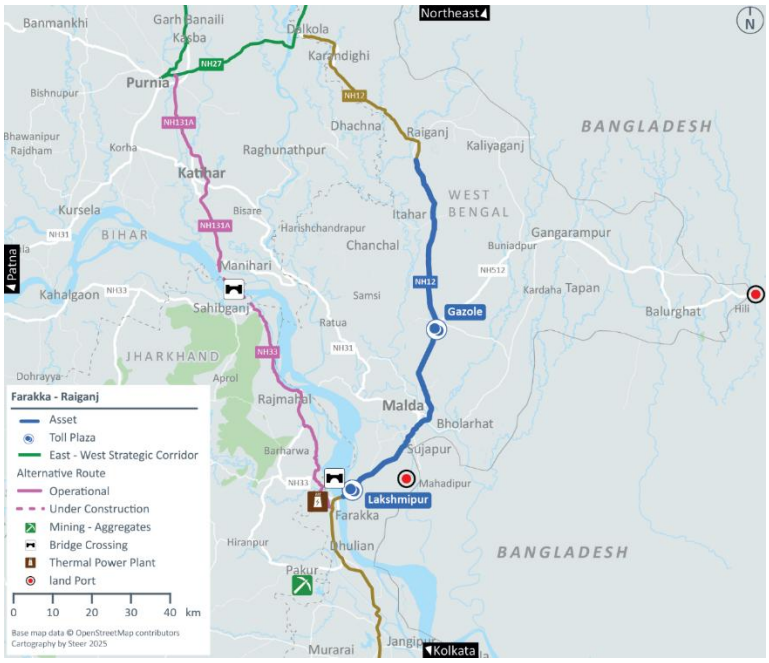
6.1 Following the discussion on estimated and assumed forecast background growth rates in the previous chapter, this chapter first deals with the forecasting assumptions around base year AADT and potential impacts on traffic growth on the Asset. Later, it presents the assumed toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to estimate the forecasted revenue based on the forecast traffic. In the final section, the chapter summarises the traffic growth rates for the forecast years.

Analysis of potential network impacts

Alternate routes and improvements

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in Chapter 2, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, and feeder roads) in the surrounding road network. Figure 6.1 below shows the road network surrounding the Asset.

Figure 6.1: Asset route shown against the regional network context



Source: Steer analysis and cartography

6.3 Table 6.1 below summarizes upcoming network/other developments considered for this Asset, corresponding alternate/feeder routes associated with these developments, their year of completion, and indicative direction of each impact on the Asset.

Table 6.1: List of network/other developments

S. No.	Development	Route affected	Year of completion	Impact (+/-)
1	Completion of Sahibganj Bridge	Trips between south of Farakka and North of Raiganj.	FY29	-ve
2	LoS improvement (4-laning of Krishnanagar-Behrampore section of the NH12)	Asset Corridor	FY27	+ve
3	Recovery of Bangladesh bound traffic	Asset Corridor	FY27	+ve

Source: Steer analysis

Impact assessment for network/other developments

6.4 The subsection below includes a narrative of the improvement, as listed in the table above, and impacts associated to that development.

Completion of Sahibganj Bridge

6.5 As discussed in Chapter 2, the completion of 6-km 4-lane Sahibganj bridge across the Ganges between Sahibganj (JH) and Manihari (BH) is expected to be completed by FY29[Error! Bookmark not defined.]. Upon its completion, we expect that some of the traffic currently p lying on the Asset moving between Farakka, Pakur, Nalhati and further south (of Bengal) and parts of Bihar (including Purnia, Katihar), and north of Raiganj (in WB) will divert to this alternative route especially short to medium distance trips.

6.6 It can be seen from Figure 6.1 above that the northern section of the longer corridor i.e., Purnia and Manihari section of the NH131A is already 4-laned and currently being tolled at the Routara toll plaza. Going forward we expect the southern section of the corridor i.e., the Sahibganj-Farakka section of the NH33 to also become fully upgraded to a 4-lane configuration, improving the overall LoS of alternative route to the Asset. The impact estimated is applied in the following manner: 25% in FY29; 50% in FY30 and 100% from FY31

6.7 Table 6.2 below presents the impacts estimated for both the toll plazas.

Table 6.2: Impact of completion of Completion of Sahibganj Bridge

Vehicle type	FY29	FY30	FY31 Onwards
Staging	*25%*	*50%*	*100%*
TP1 Lakshmipur			
2A	(0.5%)	(1.0%)	(2.1%)
3A	(0.7%)	(1.4%)	(2.7%)
MAV	(0.7%)	(1.4%)	(2.9%)
TP2 Gazole			
2A	(0.4%)	(0.9%)	(1.8%)

Vehicle type	FY29	FY30	FY31 Onwards
3A	(0.6%)	(1.3%)	(2.5%)
MAV	(0.9%)	(1.8%)	(3.6%)

Source: Steer analysis

4-laning of Krishnanagar-Behrampore section of NH12

6.8 As seen in Figure 6.2 below, while the Raiganj bypass and ROB as well as the Raiganj-Dalkhola section of the NH12 have been fully upgraded (to 4-lane configuration) as of early FY25[9], the southern section of the NH12 (i.e., 4-laning between Krishnanagar and Behrampore) is still under construction in several sections (as of February 2026) and is expected to completed by mid-FY27.

Figure 6.2: Impact of 6-laning LOS improvement

Source: Steer analysis and cartography

6.9 Given the 4-laning of the NH12 section between Kolkata and Krishnagar was also completed as of early FY25[21], the completion of the Krishnanagar-Behrampore section will significantly increase the LoS offered by the NH12 across its full length from Kolkata to Raiganj, improving long-distance commercial traffic access to the Asset. To incorporate the positive impact of this development on future traffic growth on the Asset, we performed a GJC cost analysis of the NH12 pre- and post-completion of the project.

6.10 A comparison of generalised journey costs (GJC) provides how different elements of cost and time affect traffic. This comparison was done for both light and heavy vehicles. Lower GJCs correspond to higher induced traffic. Based on Steer's studies and research in India, we have found that for every 1% reduction in the GJCs, the traffic increases by a factor of 0.3. We then applied the difference of GJCs to the elasticity of 0.3 to get net influence on the traffic.

6.11 The improvement in travel costs or GJC is translated into the impact on that share of local + IAOI OD movements using a linear inverse relationship. Thereafter, the GJC influence is applied on the corresponding shares of traffic, which were extracted from OD data.

6.12 Table 6.3 and Table 6.4 below present the extent of the LoS impact on both Asset toll plazas and the expected timelines of the impact on the Asset.

Table 6.3: Impact of 6 laning LOS improvement for TP1 Lakshmipur

Recovery of Bangladesh bound Traffic

6.13 The overall slowdown and rising inflation in Bangladesh's economy has led to overall drop in export and import and in addition affected the construction activity in the country, due to which demand of construction materials has declined. The political instability in the country[22] has also had an impact on trade, with FY25 seeing a major dip following the crisis that emerged in August 2024. This has continued in FY26YTD as well.

6.14 Bangladesh's economy has recently been affected by economic downturn due to high inflation, dwindling foreign reserves, high debt among others resulting in a decline in

[21] **Project Details - NHAI (Four Laning of Bal. Works of Barasat-Krishnagar from km. 48.553 to km. 115.272)**

[22] **Timeline of student-people's 'July uprising' | News**

overall economic activity in the country. Private consumption growth, public investments witnessed a fall in Bangladesh, as a result the country's imports have also gone down, according to a report published by the Asian Development Bank, earlier discussed in section 2.17. This had led to fall in India's overall exports to Bangladesh by ~19% in FY24 vs FY23. This drop continues in FY25 and FY26 up to October 2025.

6.15 Trends in Bangladesh-bound export volumes suggest recovery from October 2025 as Bangladesh's political situation stabilised. With fresh elections and new government being established in February 2026, recovery in Bangladesh exports is expected to happen from FY27. This was validated by the site visit conducted by Steer in February 2026.

6.16 However, with the recovery in Bangladesh economy, we expect construction activity in the country to pick up and export demand will start increasing.[23] This recovery impact is assumed from FY27 onwards and expected to materialise in full by FY28 in a phased manner as shown in Table 6.5 and Table 6.6 below.

Table 6.5: Impact of Bangladesh Recovery on TP1

Overloading

6.17 Overloading contributes to a significant share of both traffic and revenue at both Asset toll plazas. Over the past years since commencement of tolling, the proportion of overloading has varied significantly, mainly due to the decisions taken by the local administration to either ban or lift the ban on overloading at various times.

6.18 Since overloading proportions are already at historic lows, (as discussed in Chapter 3), no further reduction in overloading shares has been assumed in our future traffic and revenue forecasts for the Asset. FY26YTD (as of Feb'26) average overloading shares have been considered for the forecasts.

Table 6.7: Overloading assumptions for forecast years (FY26 onwards)

Vehicle type	TP1 Lakshmipur	TP2 Gazole
LCV	1.1%	2.2%
2A	0.4%	0.8%

Vehicle type	TP1 Lakshmipur	TP2 Gazole
3A	0.1%	0.6%
MAV	6.5%	2.9%

Source: Steer analysis of Client data

Revenue forecasting assumptions

6.19 To forecast the revenues for a forecast year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate. While toll segmentation provides the breakup of trips paying each ticket type, trip factors provide the conversion factor to convert from traffic (trips) to tickets sold. This section discusses assumptions related to toll segmentation, trip factors and toll rates for the forecast period.

Toll segmentation

6.20 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles[24].

6.21 Across multiple assets, the share of annual pass trips has been rising on a monthly basis since August 5. A corresponding decline in other ticket categories including Single and Return journeys has been observed.

6.22 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and post-annual pass segmentation from 15th August 2025 till 28th February 2026. The share of annual pass trips in March 2026 has been assumed to be the same as the share of annual pass trips in the last 10 days of February 2026.

6.23 The segmentation for CJVs in FY27 has been assumed to be the same as the estimated March 2026 segmentation as trends suggest that the share of annual pass trips have stabilised. For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Feb) as discussed in the earlier sections, can be considered a normal period:

Table 6.8: Toll segmentation at TP1 Lakshmipur

Forecast	CJV (FY26)	CJV (FY27)	Mini-LCV	LCV	Bus	2A	3A	MAV
Single	25.9%	22.0%	28.4%	41.9%	17.4%	75.0%	78.0%	44.5%

Trip factors

6.24 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and are presented in Table 6.10 and Table 6.11 below.

Table 6.10: Trip factors at TP1 Lakshmipur

Forecast	CJV/Mini-LCV	LCV	Bus/2A	3A	MAV

Toll evolution

6.25 Based on the concession agreement and the gazetted toll notification, we see that base toll rates increase every year based on WPI-linked inflation to provide us unrounded toll rates. These are rounded up to the nearest five rupees to estimate the rounded toll rates charged to the road user.

6.26 We have used actual toll rates from FY25 toll notifications to validate the modelling of the toll evolution. Forecasted growth in WPI was adopted from Client based inputs of WPI growth forecasts, presented in Table 6.12 below. The upward trend in inflation is expected to continue in the medium term, before gradually tapering to 4.1% in the long term.

6.27 These WPI forecasts provided by the Client. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the Client.

Table 6.12: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	0.96%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: FY28 onwards WPI print as per client inputs

Revenue reconciliation

6.28 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue for FY26YTD. To reconcile we have used the FY26YTD segmentation, FY26YTD AADT and compared it with the reported revenue for the year. The exercise was undertaken at an annual level. The comparison, as shown in Table 6.13 below, depicts the modelled revenue vs the reported revenue difference, and the difference lies within 0.1%. This gives us the confidence in the assumptions around segmentation and trip factors for future forecast purposes.

Table 6.13: Revenue reconciliation summary (AADC INR lakhs)- FY26YTD

Toll Plaza	Modelled Revenue	Actual Revenue	Difference (%)
TP1 Lakshmipur	47.34	47.34	0.0%
TP2 Gazole	21.62	21.63	(0.1%)

Source: Steer analysis

Traffic and Revenue forecasts

6.29 Based on the traffic and revenue related forecast assumptions discussed above, we modelled traffic and revenue forecasts for the Asset over its full concession period. Table 6.14, Table 6.15, Table 6.18, and Table 6.19 below present the AADT/PCU forecasts and

associated forecasted growth rates on the Asset. Further, Appendix A presents the AADT and revenue forecasts for the Asset.

Table 6.14: Final Traffic forecast for TP1 Lakshmipur

Vehicle Type	FY26	FY27	FY30	FY32	FY37	FY42

6.30 As presented in Table 6.15 and Table 6.19 above, concession end CAGRs (i.e., for the period FY26-FY42) of our final traffic forecasts (i.e., background growth + impacts) in PCUs are 4.9% and 4.5% per year at TP1 Lakshmipur, and TP2 Gazole (respectively). While the background growth is primarily driven by car growth followed by MAV growth, the minimal uplift in final growth rates (as evidenced in Figure 6.3 and Figure 6.4 below) is due to two impacts expected going forward namely, (1) Recovery in Bangladesh-bound construction traffic movement on the Asset, and (2) Increased long-distance and within state traffic flows on the Asset due to significant LoS improvement on the NH12 corridor due to 4-laning completion of the Krishnanagar-Behrampore section of the NH12.

6.31 Figure 6.3 and Figure 6.4 below present the PCU volumes and growth rates from the Base Year (FY26) through the end of the concession in FY42.

Figure 6.3: Forecast traffic and growth rates in PCUs - Background and final, TP1

Upside and Downside cases

Upside and Downside scenario assumptions

6.32 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.33 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local

manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.34 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.22: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.35 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.36 The upside case impacts included in forecasts are summarised in below.

Table 6.23: Summary of impacts on the Assets – upside case

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Lakshmipur	TP2 Gazole
Sahibganj Bridge Completion	FY29*	+25% of base case	2A: (1.6%) 3A: (2.0%) MAV: (2.1%)	2A: (1.3%) 3A: (1.9%) MAV: (2.7%)
Bangladesh bound traffic recovery	FY27*		3A: 5.9% MAV: 7.6%	3A: 2.5% MAV: 1.9%
4-laning of Krishnanagar-Behrampore section of NH12	FY27*		CJV: 2.1% MLCV: 2.6%	CJV: 1.3% MLCV: 1.6%

Source: Steer analysis; *Same as base case timeline

Impacts-Downside Case

6.37 The downside case impacts included in forecasts are summarised in the table below.

Table 6.24: Summary of impacts on the Assets - downside case

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Lakshmipur	TP2 Gazole
Sahibganj Bridge Completion	FY29*	-25% of base case	2A: (2.6%) 3A: (3.4%)	2A: (2.2%) 3A: (3.1%)

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Lakshmipur	TP2 Gazole
			MAV: (3.6%)	MAV: (4.6%)
Bangladesh bound traffic recovery	FY27*		3A: 3.5% MAV: 4.5%	3A: 1.5% MAV: 1.1%
6-laning LOS improvement	FY27*		CJV: 1.3% MLCV: 0.9%	CJV: 0.8% MLCV: 0.6%

Upside and Downside Case Forecasts

6.38 Table 6.25 below presents the difference between the Upside and Downside Case forecasts relative to the Base Case forecasts in FY42 (i.e., the concession end year) for both Asset toll plazas. The table and charts below plots the Upside and Downside Case forecasts relative to the Base Case forecasts for each Asset toll plaza over the full concession period (FY26-FY42).

Table 6.25: Percentage Difference Upside and Downside Case Forecasts vs. Base Case Forecasts - FY42

Case	Measure	TP1 Lakshmipur	TP2 Gazole
Upside Case	Traffic (PCU)	25.8%	24.2%
Downside Case		(18.5%)	(17.4%)
Upside Case	Revenue	41.7%	39.8%
Downside Case		(27.2%)	(26.2%)

Summary outlook

6.39 Overall, passenger traffic on the Asset is mainly influenced by leisure travel between major urban centers in the state and near the Asset including Kolkata in south Bengal as well as other towns like Farakka, Malda, Gazole, and Raiganj that lie along the Asset route. In contrast to the passenger traffic profile on the Asset, most of the goods traffic observed on the Asset is influenced by economic productivity of local stone mines/quarries and crushing units near the Asset (i.e., in Pakur district of Jharkhand) and trade export flows of construction materials (particularly stone chips) and agricultural products from India to Bangladesh, which is further linked to the Bangladeshi economy.

6.40 Between FY22 and FY25, both passenger and goods traffic on the Asset have observed robust growth, with TP1 growing at an CAGR of 2.6% and TP2 at 4.0% , attributable to growing household incomes and local tourism activity in the region, as well as the ongoing construction of the New Farakka Setu, which has kept demand for construction material buoyant, and induced growing construction traffic movement on the Asset over the same period. Further, a slowdown in supply of stone and construction material from Jharkhand for Bangladesh was observed due to erratic mining on account of the monsoon. On the demand side, it was observed that the demand for stone aggregate still has not fully stabilised in Bangladesh. As a result, traffic on Lakshmipur has seen lower growth than Gazole.

6.41 While most of the NH12 between Kolkata and Dalkhola has already been upgraded to 4-lane configuration, some sections such as the Krishnanagar-Behrampore section are still yet to complete in full. These upgrades are anticipated to enhance the overall service level along the entire corridor, leading to not only steady traffic growth on the Asset via traditional movements but also an increase in induced traffic volumes on the Asset.

6.42 The Asset acts as the primary route connecting Kolkata and southern West Bengal with the northern parts of the state and Northeast India. Consequently, improvements in

service levels due to the completion of construction in various planned and ongoing sections are expected to encourage more passenger movement and stimulate additional traffic. The strategic and geographical advantage of its unique location works in favour of the Asset, as there are currently no other viable alternative routes for users moving between these regions.

6.43 In summary, future traffic growth outlook of the Asset remains promising given its captive commercial traffic market and strategic nature as the only viable route connecting South Bengal and beyond to parts of North Bengal and the NE states. Furthermore, it serves as the main artery on the tourism corridor, with both state and national governments focusing on developing northeastern states as tourism hubs in the near future. We expect traffic on the Asset to rebound in-step with a revival of the Bangladeshi economy which is forecast to return to trend growth by FY27 and beyond[25]. Thus, the underlying growth drivers of the corridor remain robust and are expected to deliver sustained long-term growth.

B Data Collection Exercise

B.1 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

TVC count

Table B.1: 3-day TVC counts at TP1 Lakshmipur

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through February 2026. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Ghaziabad Aligarh Expressway Private Limited (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 11 project". This report presents an update of the traffic and revenue forecasts based on primary surveys undertaken in 2026, actual traffic data available up to February 2026 and latest macro-economic assumptions.

1.2 The Asset Ghaziabad- Aligarh consists of a single stretch of toll road with two toll plazas. For this report, we hereafter call the toll plazas present on the Asset as TP1 and TP2 respectively.

- TP1 – Luharli
- TP2 – Somna (Gabana)

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by Client for the period between FY16 and Mar '26, with FY26 base AADT and forecasts considering data up to Feb'26
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical toll plaza data provided by Client and benchmarks from Asset in the vicinity wherever long time series historical data was not available
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer in Feb '26 on TP1 and TP2.
• Analysis of upcoming network improvements and other	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis was

Scope of work	Data source
developments, that may have future impacts on traffic	conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor • Gross Domestic Product (GDP) forecast assumptions provided by Client
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI) and latest actual Wholesale Price Index (WPI) trends as shared by the Client. • Assumptions of WPI forecasts and future tolling length changes provided by Client • Revenues estimated as a product of traffic forecasts and toll evolution

Source: Steer

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis has essentially focused on two sets of issues, namely:

- Understanding the traffic that is currently using the Asset; and
- Identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting June 2015 to March 2026. The historical traffic and revenue presented in Chapter 3 considers information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous studies related to traffic and revenue
  - Bid documents and studies by lenders

  - In previous studies Steer-commissioned OD survey on 3rd February 2025 on TP1 and 4th February 2025 at TP2 to validate any change in growth drivers and travel patterns and TVC counts between 3rd of February 2025 and 5th of February 2025. TMS for the coinciding dates was available from the data shared by Client
  - In this Study, Steer commissioned OD and TVC surveys on TP1 Luharli and TP2 Somna to observe the change in travel patterns and growth drivers. OD survey on TP1 was conducted on 19th February 2026 and on TP2 on 20th February 2026.
  - TVC surveys on TP3 and TP4 was conducted from 19th Feb'26 to 21st Feb'26.
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by the toll plaza and subsequently matched it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position by applying seasonality correction factors (SCFs) on 11 months of traffic data (April to February).
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY27 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by Client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.7 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;

- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analyses;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 summarises our approach and results on estimating background traffic demand growth along with our key forecasting assumptions,
- Chapter 6 presents our baseline year forecast, concession traffic and revenue forecasts for the Asset along with assessment of network impacts.

2 The Asset

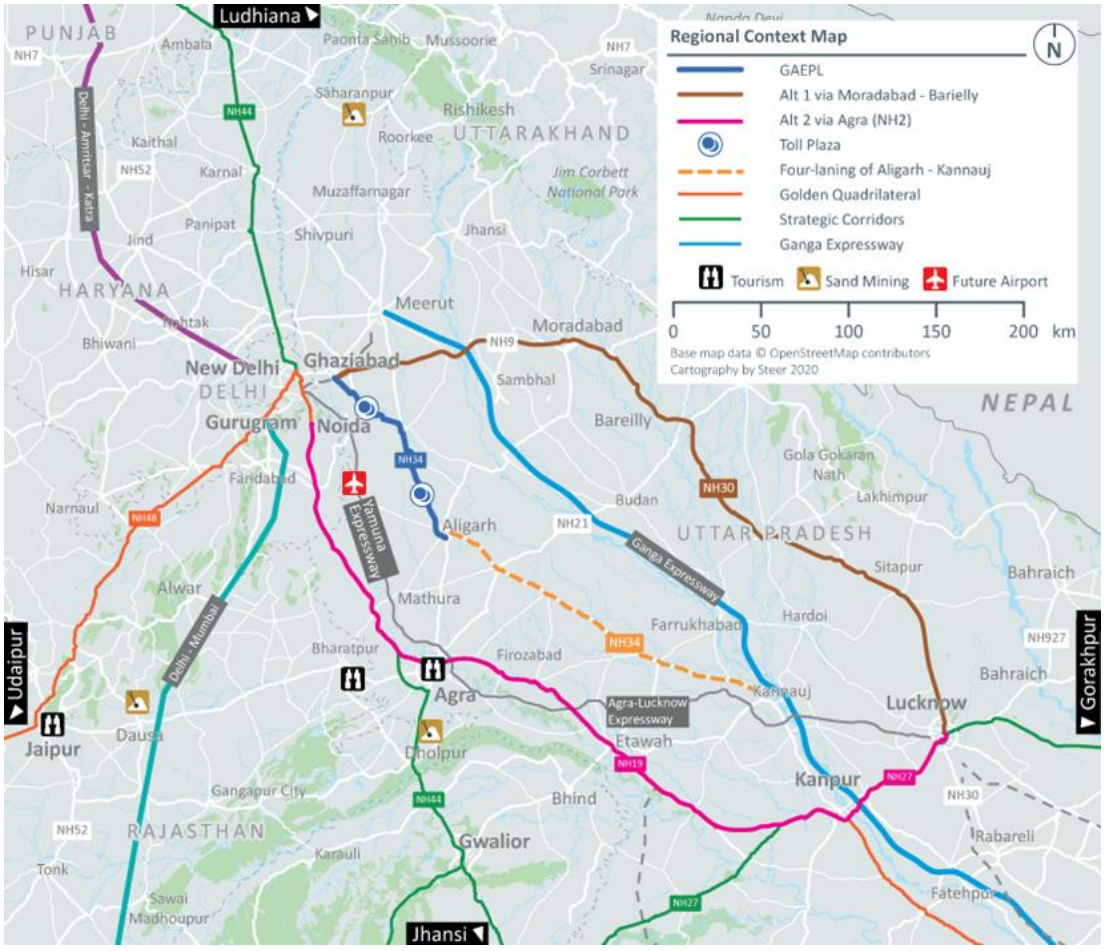
Introduction

2.1 This chapter provides a description of the Asset, primarily based on both primary (site visits) and our understanding of the regional and network context of the Asset. Starting with the strategic network context, the chapter discusses the Asset-level context, followed by economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in western Uttar Pradesh (UP), connecting the cities of Ghaziabad and Aligarh via Khurja and Bulandshahar. Figure 2-1 below shows the regional and wider road network in which the Asset is located.

Figure 2-1: Asset Location



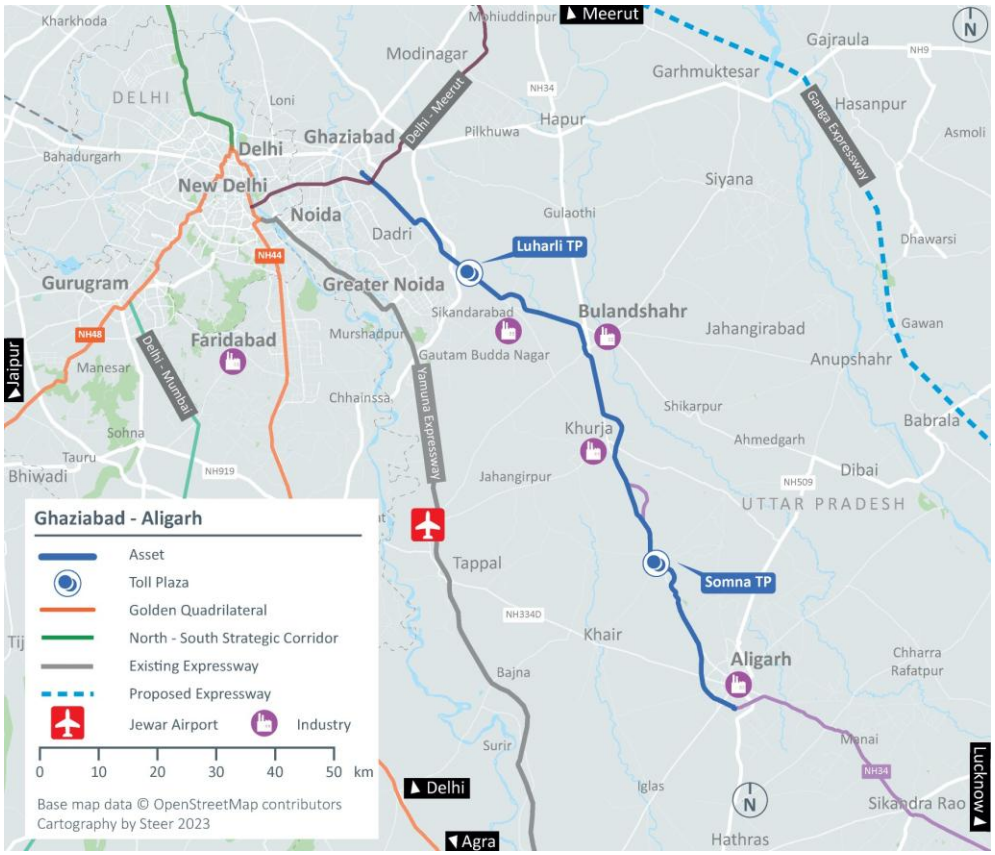
Source: Steer cartography

2.3 This 125.175-km asset is a six-lane toll road, a segment of NH 91 in Uttar Pradesh. It features two toll plazas: Luharli (TP1), situated closer to Ghaziabad, and Somna (TP2), near Aligarh. In October 2023, the Asset was expanded to a six-lane configuration, significantly enhancing capacity and unlocking growth across all vehicle categories that has sustained until present. In July of 2025, Luharli (TP1) was expanded to 16 lanes from 8 lanes earlier to ease congestion at the plaza during peak times[1].

Figure 2-2: Completed 6-Laning of the Asset

Source: Steer site visit

Figure 2-3: Asset context



Source: Steer cartography using OpenStreetMap data

[1] Jagran News, July '25

2.5 The Asset primarily caters to three different types of movements, by virtue of its strategic location on various corridors:

- Local traffic between cities in western UP, Delhi Central NCR (consisting of Delhi state) and Ghaziabad.
- Trips to the industrial area of Sikandrabad which is located on the Asset and serves as a major attractor/generator of traffic.
- Heavy vehicle traffic originating from the states of Haryana, Punjab and Jammu and Kashmir in the north travelling to states in the east of India including West Bengal, Orissa, and the north-eastern states. The Asset is part of strategic north – east movement.

2.6 On TP1, most of the traffic is to/from Delhi NCR and Sikandrabad Industrial Area which has small and medium scale manufacturing industries such as tiles, pesticides, pipes, paint, and furniture. Some of the key players such as Orient Bell tiles, Ultratech Cement, Vishal Pipes, Goodluck Industries have their presence in the vicinity of the Asset. Apart from these, there is also long-distance traffic going towards Kanpur present at TP1.

2.7 On TP2 Somna, majority of the traffic is medium to long distance going to and from Kanpur and Etawah. Also, local transportation of meat and hardware from processing plants and industries near/in Aligarh also contribute to traffic on the Asset. There exists significant bus traffic between Delhi and Aligarh that appears on this plaza as well. TP2 also has presence of THDC power plant in Khurja opened in January 2025[2].

Concession and tolling

2.8 The toll plazas on the Asset have been operational since June 2015. As per the original concession agreement the concession period was of approx. 20 years, which was scheduled to complete by 2035. But as per the settlement agreement dated 08th April 2022 an extension of 4.32 years has been granted and agreed upon by National highways Authority of India (NHAI) based on the clause 29 of the concession agreement and now the end of concession has been extended to FY40.

Table 2.1: Concession details

Item	Description
State	Uttar Pradesh
Highway and lane configuration	NH 91 six-lane
Toll plazas	TP1: Luharli TP2: Somna
Length (km) as per concession agreement, applicable	TP1: 62.175 Km TP2: 63.00 Km
Commencement of operations*	TP1: June 2015 TP2: June 2015
Concession period	24 years
Last year of concession	FY40

Source: Concession agreement

2.9 The following pictures indicate a typical cross-section of the Asset and its toll plazas.

Figure 2-4: Typical cross section of the Asset and toll plazas

Source: Steer photos from site visit

2.10 In July '25, the Luharli toll plaza (TP1) was expanded to a 16-lane staggered configuration. The new plaza has eased congestion at the toll plaza during peak times and increased capture of traffic that earlier bypassed the plaza via a nearby micro diversion route (discussed later). Overloading is charged on TP1 only and not on TP2.

2.11 Tolls are collected for Car/Jeep/Van (CJV), LCV/Minibus, Bus/Truck, 3A/MAV/HCH/EME/OSV categories. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling, apart from hybrid lanes. The toll rates for FY26 are as shown in Table 2.2 below.

Table 2.2: Vehicle wise toll rates on GAEPL (INR)

Type of Vehicle	Single Journey Fee	
	TP1 Luharli	TP2 Somna*
CJV	150	200
LCV	235	305
Bus/2A	480	615
3A/MAV	735	935
OSV	940	1220

Source: NHAI Revision of User fee rate, w.e.f. 01.04.2025; *For TP2, these reflect official toll rates as per the FY26 NHAI Toll Notification. Toll rates assumed in our forecast models are lower as we exclude 2.185 km from the total tolling length of TP2 from FY26 onwards as per Client input.

2.12 Apart from single tickets, the typical NHAI ticket categories like return, monthly, local personal and local commercial passes are also available on the Asset. Annual pass for CJV users is also available on the toll plaza.

Key economic activities

2.13 Uttar Pradesh is the most populous state in India and is largely an agrarian economy with agriculture being a major source of employment and livelihood. With several urban centres located on the Asset, including Ghaziabad, the toll plazas, especially TP1 Luharli, serve large volumes of local and regional light vehicular traffic with its proximity from Delhi/NCR and Ghaziabad.

2.14 The part of the state, where the Asset is located, is an industrial region with towns like Sikandrabad, Khurja and Aligarh that serve as separate distinct hubs of medium and large-scale industries specializing in manufacturing (e.g., ceramics, hardware). Commercial traffic on the Asset reflects characteristics consistent with this industrial profile carrying manufactured commodities from nearby factories to consumption centres elsewhere or intermediate goods destined for these factories for further processing on their production lines.

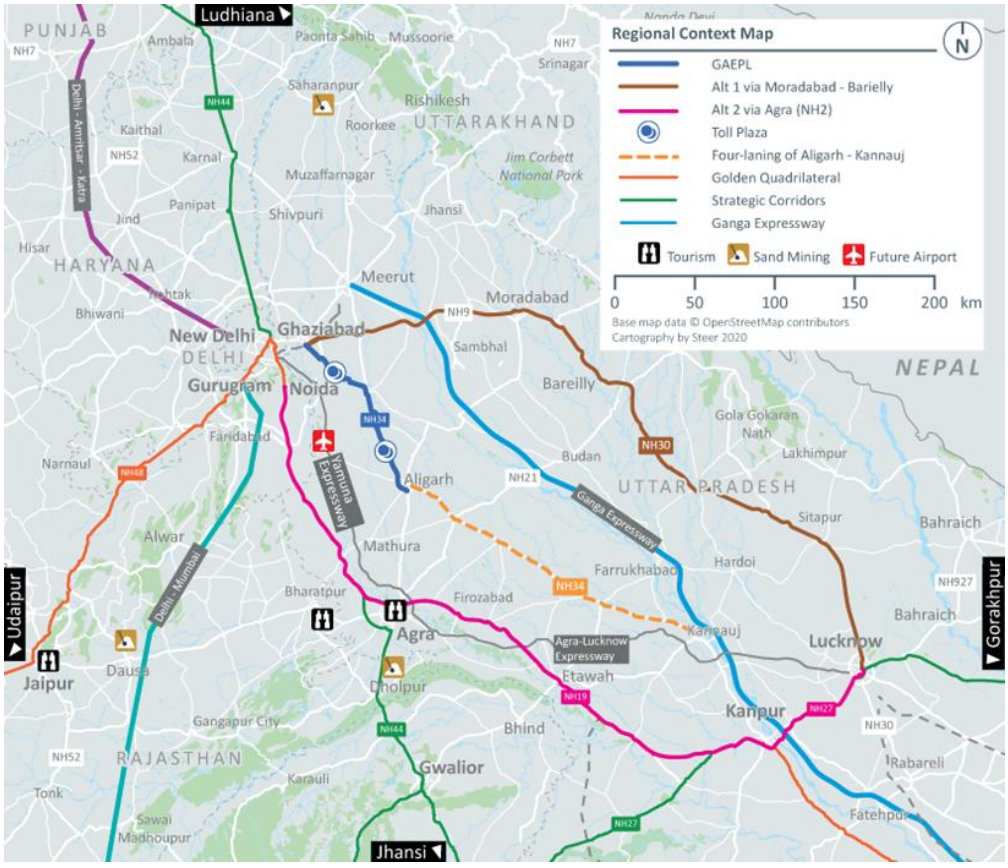
2.15 At TP1, majority of the commercial traffic is plying between Sikandrabad Industrial Area and National Capital Region (NCR). The influence of these economic drivers on the Asset's performance is discussed in more detail in Chapter 3 and 5 below.

Alternate Routes

2.16 The Asset occupies a strategically vital position along the east-west corridor connecting Delhi and the west with Lucknow and beyond. Figure 2-5 below illustrates other alternate routes available to long-distance users while travelling between Delhi and Lucknow. Currently, for travelling between Delhi and Lucknow there are four major routes:

- Asset: Delhi-Ghaziabad-Aligarh-Kannauj-Lucknow via NH91
- Alternate 1: Delhi-Moradabad-Bareilly-Sitapur-Lucknow via NH 24
- Alternate 2: Delhi-Faridabad-Agra-Kanpur-Lucknow via NH2 (NH19).
- Alternate 3: Delhi-Agra (via Yamuna Expressway)-Lucknow (via Agra-Lucknow expressway).

Figure 2-5: Alternate routes



Source: Steer Cartography

2.17 Medium-distance traffic, particularly those traveling southeast of the Asset, now have access to several recently upgraded state highways (such as the 4-laned Aligarh-Kanpur section). These improvements have enhanced the quality of the local road network, offering cheaper, and often free, alternative routes to industrial hubs such as Sikandrabad and Ghaziabad.

2.18 Chapter 6 provides a discussion and estimation of potential impacts due to these alternate routes in addition to the impact of new routes not currently operational (but expected to become operational in the near term) such as the Ganga Expressway

2.19 On the northbound side (towards Ghaziabad direction) near TP1, a micro leakage exists which could earlier be accessed from points on the Asset roughly 400-500m away from the earlier in-line plaza location. It is a two-lane local road which mostly caters to local Car and Mini-LCV traffic, that previously offered users the opportunity to evade the toll by taking a 1 km longer detour that could be travelled in roughly 10 minutes.

2.20 To address the issue of micro diversion of toll paying traffic, a Check Plaza was opened in Aug'23 at the location where local leak was connecting to the Asset. After almost a year of being operational, during which the existence of the check plaza significantly reduced leakage at TP1, the check plaza was vandalized by locals in September 2024.

Staggered Plaza for TP1: Luharli

2.21 While the check plaza was not under operation since September 2024, the newly operational staggered plaza configuration has reduced this leakage going forward. The staggered plaza was opened mid-July 2025. Traffic from September 2025 suggests significant increase in traffic, particularly CJV traffic at TP1 prior to the introduction of the Annual Pass on 15 August 2025. Thus, beyond assumptions of how we expect the share of Annual Pass CJV trips to evolve going forward (and its impact on residual CJV ticket shares), we have not assumed any further changes in segmentation that may or may not result from operationalisation of the staggered plaza configuration of TP1 relative to its earlier in-line configuration.

2.22 There exists a local diversion road at TP2 Somna as well. However, the TP2 micro diversion road is unmetalled and local villagers show resistance against vehicles using this road, suggesting that TP2 does not suffer the same or any significant level of revenue loss due to existence of this local diversion road.

Figure 2-6: Local leak at TP1 (first row) and TP2 (second row)

3 Traffic Description

Introduction

3.1 This chapter describes current traffic and revenue trends on the Asset, as well as Steer's analysis of origin-destination (OD) data and traffic count data, including that which was collected as a part of this study, and data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year Monthly Average Daily Traffic (MADT) is established. This data is typically provided by the Client and independently analysed and validated by us using Traffic Volume Count (TVC) information.

3.4 The below sections present historical traffic and revenue information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.

PCU Factor assumption

3.5 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in Table 3.1 below.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV/ Mini LCV	1.0
LCV	1.5
Bus/2A/3A	3.0
MAV*	3.8
OSV	4.5

Source: Steer analysis and IRC64,1990

Historical Trends

3.6 Table 3.2 and Table 3.3 below present the historical variation in total traffic and tollable traffic volumes at TP1 Luharli toll plaza, by vehicle category and in total PCU terms.

Table 3.2: Historical evolution in AADT by vehicle class at TP1 – Luharli

Vehicle	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26	CAGR (FY19-26)

Source: Steer analysis of the Client data. FY26 represents full year actual (April to March).

3.7 Between FY19 and FY25, total PCUs on TP1 grew at approximately 2.7% per year. This modest PCU growth on TP1 was primarily due to variability in CJV traffic capture due to the micro leakage route near the toll plaza. Since TP1 is located in the NCR region, it observes a higher share of CJV, Mini LCV, and LCV traffic relative to TP2. In addition, the plaza has historically had a high share of non-paying users within the more local CJV, Mini LCV, and LCV vehicle categories.

3.8 However, in contrast to growth in total traffic, growth in tollable traffic over the same period (i.e. FY19-FY25) has been significantly faster, having grown at roughly 8% per year since FY19. This growth in tollable volumes can be attributed to a number of factors

- The mandatory implementation of FASTag in Feb ’21.
- Capacity expansion of the Asset to six-lane configuration in October ’23, and;
- Operation of a Check Plaza between Aug ’23 and Sept ’24.

3.9 As mentioned earlier, TP1 Luharli has witnessed a positive increase in total as well as tollable traffic volume in FY26 due to a combination of factors including completion of 6 - lane configuration of the Asset and opening of check plaza at TP1 which has led to improved reporting and compliance resulting in increase in FY25 and FY26 traffic volumes as well as tollable traffic[3]. Further as discussed in chapter 2, opening of a new staggered toll plaza starting July-25 has resulted in increased capture of CJV traffic and reduced the congestion faced by users using the earlier toll plaza. This has resulted in higher capture of traffic (effectively nullifying the effect of the micro leakage), better reporting of vehicles as well as reduced wait time for users at the Luharli toll plaza.

3.10 Moreover, 4-laning of NH-914 Aligarh-Kanpur section in H2 of 2024 – located east of the Asset has further improved LOS of the corridor, paving way for growth on the Asset

3.11 The strategic location of TP1 Luharli, in proximity to major urban centers such as Ghaziabad and Delhi, and serving significant intercity movement towards Sikandrabad, further influences traffic dynamics on the Asset. The substantial share of CJVs at TP1 (74%, in FY26) is due to the Asset's location, serving large urban and industrial hubs including Ghaziabad, Aligarh, Khurja, Bulandshahar, as well as other areas in and around Delhi NCR.

3.12 The historical classification of LCV-2As has presented challenges due to the similar physical characteristics of vehicles in these categories which has led to the share of LCVs decreasing over the past five years, attributable to classification shifts between the LCV and 2A categories. The implementation of FASTag has further contributed to this trend, resulting in the reclassification of some Mini LCVs, previously counted under the LCV category to CJVs. Consequently, LCV traffic at the plaza has exhibited a declining trend since FY19, with a 6.4% annual decline observed between FY19 and FY25. Post reclassification in FY22-23 however, LCV volumes have exhibited strong growth, with FY26YTD at 5.2% above FY25 levels.

3.13 The 2A/Bus category has also experienced strong growth since FY19, benefiting from the positive impact of the Asset's six-lane expansion, as well as the 4-laning of the Aligarh-Kanpur section of the NH91. 2A trucks have also benefitted from a shift in preference from 3A trucks due to favourable changes in the legal permissible loads for 2As[5] and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. 3A traffic on the Asset has declined consistently since FY19, at a CAGR of (-10.2%)

3.14 Table 3.4 and Table 3.5 below present the historical variation in total traffic and tollable traffic volumes at the TP2 Somna toll plaza, by vehicle category and in total PCU terms.

---

[3] Luharli toll plaza witnessed tollable traffic growth due to behavioral shifts among local users during the brief operationalization of the check plaza in FY24. Although the check plaza was later vandalized in September 2024, its presence temporarily curbed toll evasion and led to a sustained increase in users opting to pay tolls. Additionally, local villagers blocked the micro diversion route used to evade tolls, increasing the detour distance from roughly 1 km to nearly 3 km. This reduced the attractiveness of the alternate route and further limited leakage, helping maintain higher tollable traffic volumes despite the check plaza's destruction in late FY24.

Source: Steer analysis of Client data; FY26 represents full year actual (April to March); Tollable traffic excludes exemption and violation.

3.15 Between FY19 and FY25, TP2 saw similar muted growth at a PCU level , which can be attributed to (1) the impact of the Covid-19 pandemic in FY21, and (2) the impact of the 4-lane expansion of the NH91 Kanpur-Aligarh section which led to a reduction in level of service during the construction period (FY22-FY24).

3.16 However, in FY26, TP2 Somna observed strong growth in MAV traffic, having grown from 1,709 AADT in FY25 to 1,958 AADT. The strong continued growth in MAV volumes at TP2 (and TP1) since H2FY24 is primarily driven by the overall upgradation of the NH91 corridor, increasing the attractiveness of the Asset as a facilitator of east-west long-distance goods movement.

3.17 Post 6-laning of the Asset in late 2023, traffic growth at TP2 picked up and has since sustained well, with FY26 traffic recording roughly 21% growth over FY25 levels. As per our site visit another contributor to the increase in volumes in FY26 is the temporary

diversion of a small volume of traffic destined towards Palwal to cross the plaza due to the closure of NH334D and Aligarh Bypass.

Historical Revenue

3.18 Table 3.6 below shows the historical reported revenue on the Asset.

Table 3.6: Historical evolution in annual revenue (in INR Crore) and AADC (in INR Lakhs)

Toll Plaza	FY23	FY24	FY25	FY26
TP1	129.7	158.7	186.7	239.3
TP2	121.6	139.3	163.5	205.1
Total	**251.3**	**298.0**	**350.2**	**444.5**
AADC (INR Lakh)	**68.8**	**81.4**	**96.0**	**130.0**
Growth		**18.2%**	**17.9%**	**26.9%**

Source: Steer analysis based on data provided by the Client; FY26 consists of data from Apr'25 to Mar'26

3.19 The opening of check plaza between Aug'23 and Sept '24 at TP1 Luharli resulted in improved reporting and compliance. This was observed as increased volumes of tollable traffic between August'23 and September'24 specifically for Cars and LCVs along with segmentation changes that showed a reduction in exemptions and violations during the same period.

3.20 Thus, better reporting and growth in tollable traffic coupled with the impact of improved LOS on the Asset in FY24 resulted in strong AADC growth in FY24 and FY25. This robust growth continued in FY26, because of the aforementioned factors, with the diversion of traffic due to the Palwal-Tappal-Aligarh being a major contributor. The average daily collection grew by ~35% in FY26, amounting to INR 1.3 Crores

Toll Frequencies

3.21 Toll frequency or segmentation is the distribution of different ticket categories recorded for all vehicle categories. This is based on the toll policy which is a part of the concession agreement. Each vehicle category has a different segmentation. As a part of our historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the Client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these category passes instead of evading toll.

3.22 Understanding the toll frequency gives us insights into the nature of traffic plying on the Asset. CJVs generally have higher shares of return passes or local monthly passes because they travel shorter distances, while heavy trucks mostly have single tickets since they travel longer distances. Exemptions and Violations are typically observed for CJVs and smaller vehicles since they are not tolled per government mandates (e.g. 2-wheelers and tractors), or include state vehicles (e.g., police cars and govt convoys) that are exempted from paying tolls as per NHAI policy. An Asset catering to short distance local traffic generally observes high share of return or other local monthly passes while one catering to strategic long-distance traffic generally has high share of single ticket traffic.

3.23 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For the Asset, the segmentation discussed below reports Exemption and violations together.

3.24 Table 3.7 below summarizes the types of tickets being sold at both toll plazas of the Asset.

Table 3.7: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows for a return journey within a day with a 50% discount on the return trip.
Monthly	Discounted single entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

Introduction of Annual pass for CJVs

3.25 The National Highway Authority of India launched the “The FASTag Annual Pass” on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.26 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll road

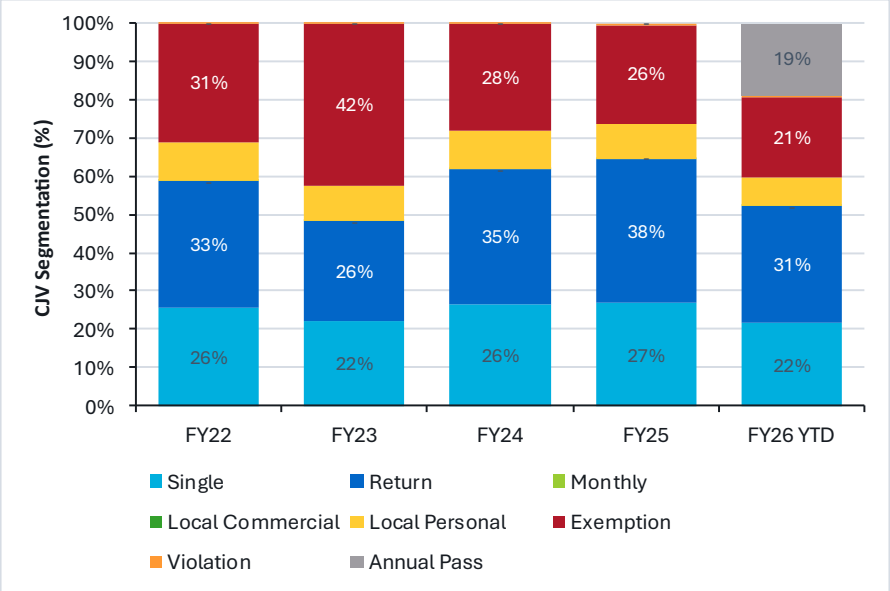
3.27 Figure 3-1 through Figure 3-4 below present toll segmentation for the historical years at TP1 and TP2 for CJVs and MAVs. Table 3.8 below presents the same for the remaining vehicle types at both the Asset toll plazas.

3.28 As a general pattern, the shares of single/return/monthly tickets tend to stabilise within 2-3 years of the commencement of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns. During FY21 and FY22, however, two key events impacted the traffic patterns throughout the country: COVID-19 and FASTag implementation. Despite large variations

in ticket segmentations observed during those two years, segmentation trends on the Asset have slowly stabilised since, with FY25 and FY26YTD showing more consistent segmentation trends for CJVs and MAVs at both TP1 than in previous years (see Figure 3-1 through Figure 3-4 below).

3.29 Given stable segmentation trends observed over the past few years and through Aug '25, we have used FY26YTD (thru Aug'25) segmentation as the base segmentation for all vehicle categories **except CJVs** for forecasting purposes. For CJVs however, we have incorporated the assumption of Annual Pass adoption through the rest of FY26 and beyond into our forecasts – this is discussed in more detail in Chapter 6.

Figure 3-1: Ticket segmentation for CJV at TP1 (Luharli)



Source: Steer analysis of the Client data; FY26YTD contains data upto Feb'26

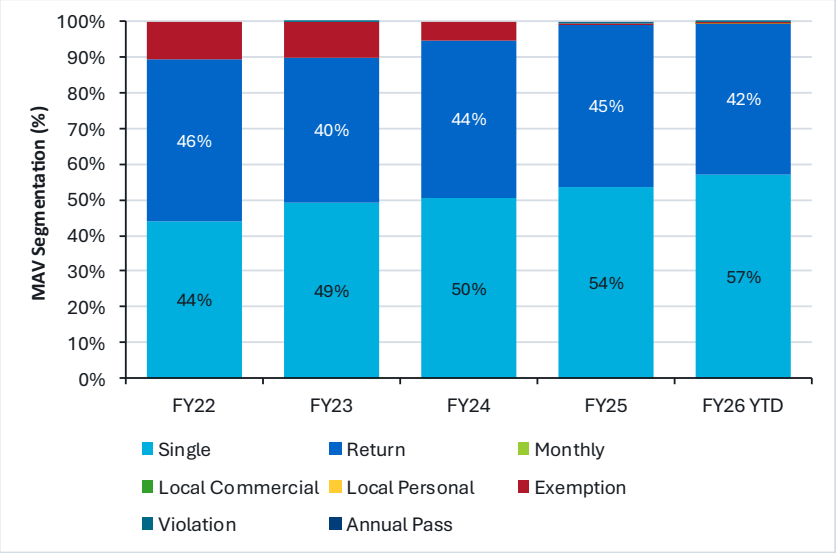
3.30 As observed from Figure 3-1 above, we see a major share of the CJV traffic under the Exemption and Violation category ranging from 30% to 42% over the years. This share has reduced to around 21% as of FY26YTD as compared to 31% in FY22. This decrease can be attributed to a few factors namely FASTag implementation in FY22, operation of Check Plaza at TP1 between in Aug '23 and Sept '24, the commencement of the staggered toll plaza in July 2025, as well as the issuance of Annual Passes from August 2025.

3.31 The magnitude of the share of exemptions observed on this Asset is much higher than our observations on similar Assets across the country. As per our observation during the site visits and our understanding of the region, local political influences and aggressive attitudes of local road users resistant to pay the toll play a role in this high share.

3.32 The share of single and return journeys have reduced from 65% in FY25 to 53% in FY26YTD on account of annual passes. Annual passes have influenced exemptions too as it has fallen from FY2 levels (26%) to 21% in FY26YTD.

3.33 Figure 3-2 below presents the ticket segmentation for MAVs at TP1. For MAVs, single ticket shares grew 4% and return ticket shares declined 1% in FY25 relative to FY24. This coincided with a 5% decrease in traffic exemptions, suggesting a greater capture of both long-distance and local traffic.

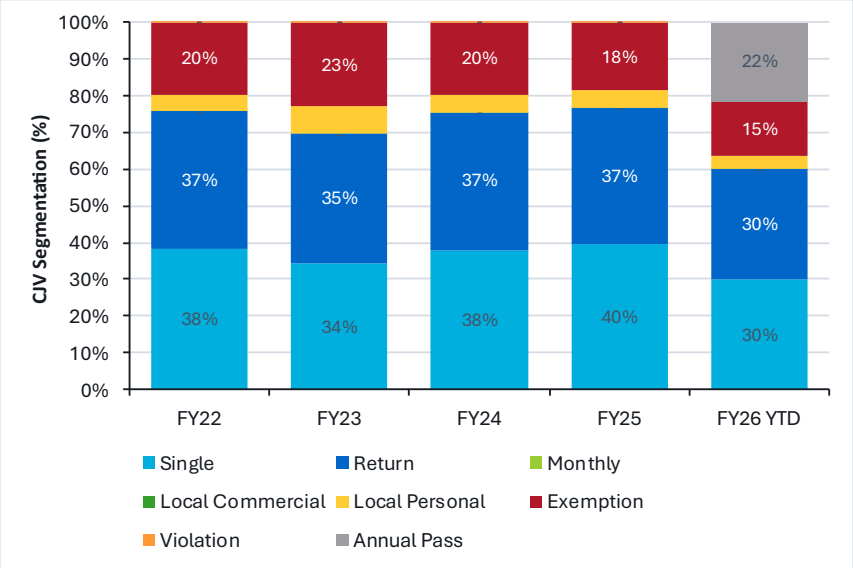
Figure 3-2: Ticket segmentation for MAV at TP1 (Luharli)



Source: Steer analysis of the Client data; FY26YTD contains data upto Feb'26

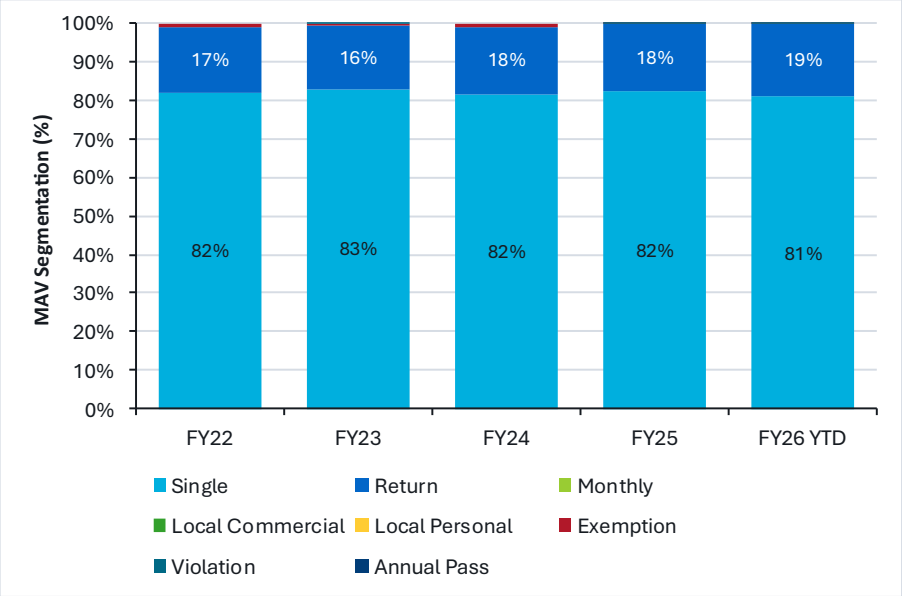
3.34 Figure 3-3 and Figure 3-4 below present the ticket segmentation for CJVs and MAVs (respectively) at the TP2 Somna toll plaza.

Figure 3-3: Ticket segmentation for CJV at TP2 (Somna)



Source: Steer analysis of the Client data; FY26YTD contains data upto Feb'26

Figure 3-4: Ticket segmentation for MAVs at TP2 (Somna)



Source: Steer analysis of the Client data; FY26YTD contains data upto Feb'26

3.35 As shown in Figure 3-3 above, return journey tickets and local personal tickets together have historically accounted for the majority share of CJV trips at TP2 Somna. The high share of local trips in CJVs is validated by their average trip length of around 260kms, suggested that majority of CJV traffic at TP2 is regional in nature. Exemptions and violations in FY26YTD are similar to FY25 shares, whereas exemptions on TP2 is lower than the TP1 given lower volumes and urban density compared to TP1.

3.36 Figure 3-4 above shows that as of FY26YTD, MAV trips observed at TP2 Somna had a high share of single journey tickets (at approx. 81% of total trips). This high share of single tickets suggests the dominance of long-distance movements, further validated by the OD analysis outputs— with MAVs averaging a trip length of approx. 650 kms.

3.37 The segmentation shows us that both the plazas on the Asset have very distinct characteristics. TP1 has a high share of local traffic catering to the travel demand generated by the regions of Dadri, Sikandrabad and Ghaziabad whereas TP2 serves long haul trips connecting north-west Uttar Pradesh, Punjab etc. to cities like Kanpur, Lucknow, Patna, Kolkata.

3.38 Table 3.8 below presents the FY26 YTD (upto Feb'26) segmentation for LCV, Bus, 2A and 3A categories.

Table 3.8: Segmentation for LCV, Bus, 2A and 3A category – FY26YTD

Ticket Category	TP1 (Luharli)				TP2 (Somna)			
	LCV	Bus	2A	3A	LCV	Bus	2A	3A
Single	40%	7%	58%	70%	58%	11%	77%	85%
Return	56%	93%	40%	30%	40%	89%	22%	15%
Local Commercial	-	-	-	-	-	-	-	-
Monthly	2%	0%	0%	0%	0%	-	-	-
Violation	-	-	-	-	-	-	-	-

	LCV	Bus	2A	3A	LCV	Bus	2A	3A
Exemption	1%	0%	1%	0%	0%	0%	0%	0%

Source: Steer analysis of the Client data

Data collection exercise

3.39 As aforementioned, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset comprising the surveys listed in the table below. While TVC survey data were provided by the Client, OD surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video graphic capture of traffic passing crossing the toll plazas, followed by manual counting. Table 3.9 below summarizes the details of the primary surveys Steer conducted as part of this study.

Table 3.9: Data collection schedule

Toll plaza	1-day OD survey		3-day videography based TVC			
	Start date	End date	Start date	Start Time	End Date	End Time
TP1 Luharli	19th February 2026	20th February 2026	19th February 2026	0900 hours	21st February 2026	0900 hours
TP2 Somna	20th February 2026	21st February 2026	19th February 2026	0900 hours	21st February 2026	0900 hours

3.40 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, in order to fully understand the impact of the fluctuation on the Asset.

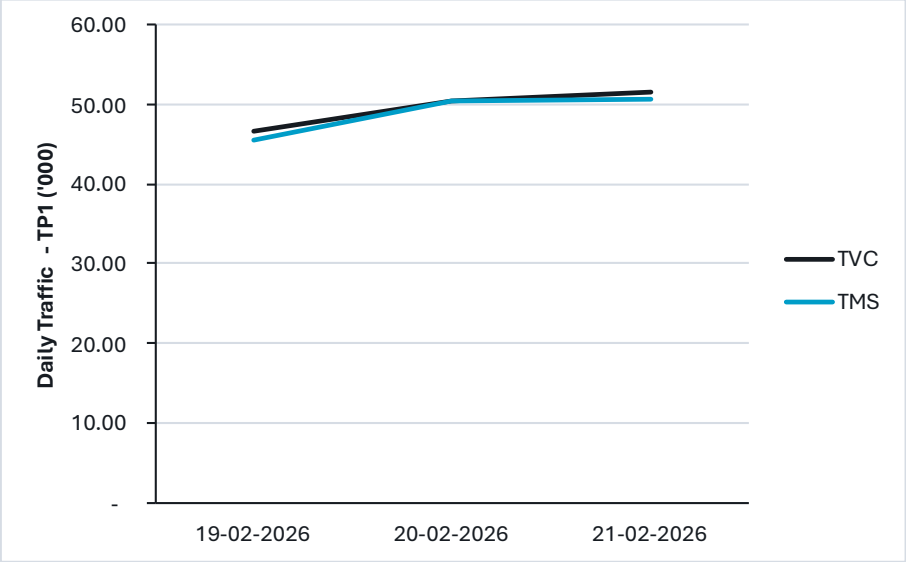
Key findings of the TVC data analysis

ADT estimates

3.41 We used the TVC data to validate the toll plaza data for the same days, as supplied by the Client via their toll management system (TMS). This TMS data was then used as the base data, for our forecasting model.

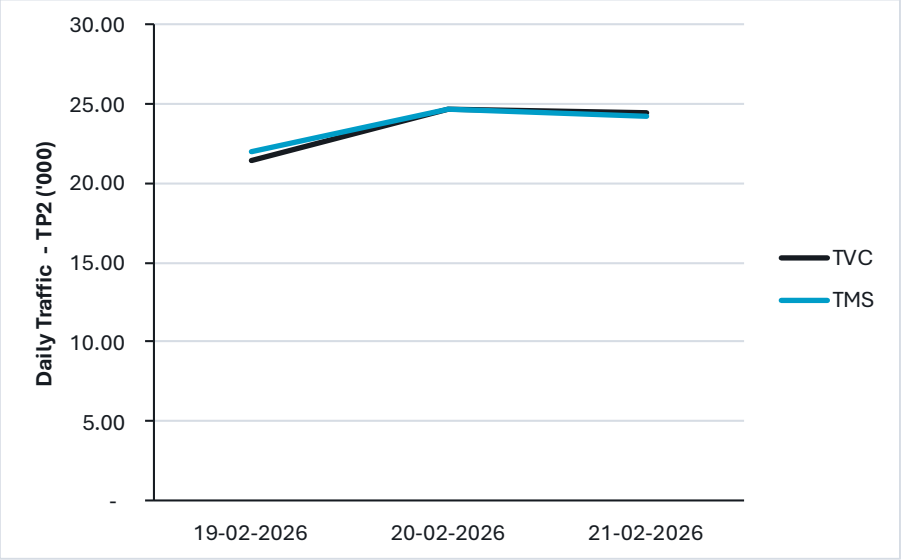
3.42 Figure 3-5 and Figure 3-6 below show the comparison between daily traffic data and shares of vehicle categories in TVC and TMS for the two toll plazas. The variation between the TVC ADT and TMS data on TP1 is approx. 1.5% at a total level and the same for TP2 is around (0.4%). The difference between daily traffic from both sources is minimal at both TP1 and TP2 and can be attributed to technical differences between the two independent traffic counting systems.

Figure 3-5: Comparison between TVC and TMS daily traffic data, TP1 Luharli



Source: Steer analysis of TVC and Client TMS data

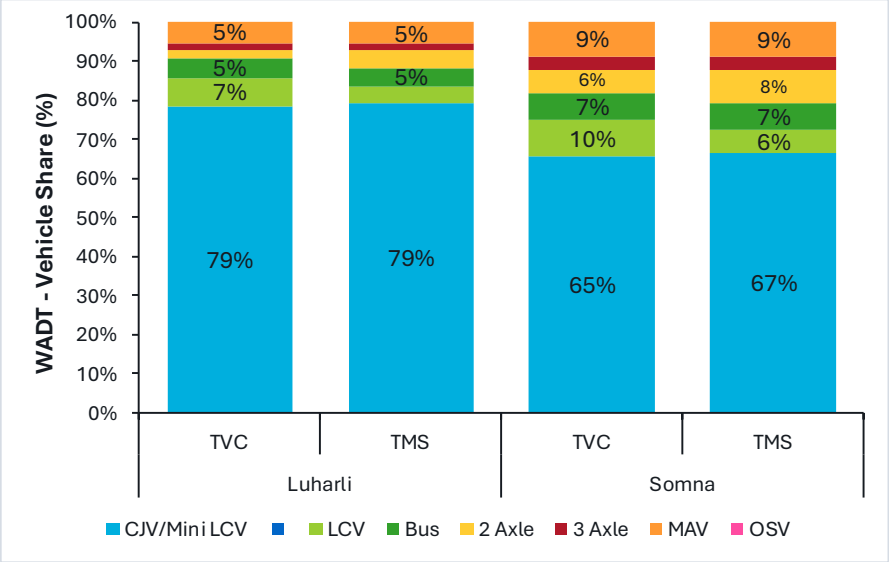
Figure 3-6: Comparison between TVC and TMS daily traffic data, TP2 Somna



Source: Steer analysis of TVC and Client TMS data

3.43 Figure 3-7 below displays the shares of vehicle types at both plazas, between TVC and TMS data. As can be seen, in the figure and as aforementioned, TP1 sees a higher influence of CJVs.

Figure 3-7: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.44 Considering the variation between the TVC and TMS is within 1.5%, our TVC-TMS analysis gives us confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

Key findings of origin-destination analysis

Overview

3.45 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. As part of this assignment, we have analysed the regional drivers of demand based on the following OD analyses on the data as provided by the Client:

- Zonal influence
- Internal External analysis
- Commodity distribution
- Trip length distribution

3.46 While zonal analysis and list of top OD pairs help us to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analysis is used to estimate key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.47 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TVC data) during the same time. Table 3.10 below presents the sample rates for key vehicle type aggregations at both the toll plazas. Lower samples in Passenger at both the plazas is due to reduced stopping time of Cars especially at the plazas post FASTag implementation. However, we believe that the sample rates of the OD data are reasonable.

Table 3.10: Sample rates for OD data

Vehicle type	TP1 Luharli	TP2 Somna
Passenger (CJV+Bus)	35%	15%
Goods (LCV+2A+3A+MAV)	78%	80%

Source: Steer analysis of OD data

Commodity Categories

3.48 We have grouped various commodities into aggregate categories for ease of interpretation, as shown Table 3.11 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.11: Aggregate commodity categories

Commodity Description	Code	Aggregation code
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood, Cork & Wood Products, Furniture	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, Household items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

3.49 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones and influenced by various cities, states, and regions in the proximity of the Asset, we have aggregated zonal data as described in Table 3.12 below. The methodology behind zone aggregation may vary based on the characteristics displayed by each Asset.

Table 3.12: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
Immediate area of influence (IAOI)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State	Rest of cities/Districts in the state that Asset lies in (other than Local/IAOI)
Haryana	Haryana
Rajasthan	Rajasthan
Uttarakhand	Uttarakhand
Bihar	Bihar
North India	Punjab, Himachal Pradesh, Jammu & Kashmir
Central India	Madhya Pradesh
West India	Gujarat, Maharashtra, Goa
South India	Southern Indian states
East & Northeast India	Jharkhand, Odisha, West Bengal and Northeast Indian states
Outside India	Nepal, Bhutan, Bangladesh

Source: Steer analysis

Zonal influence

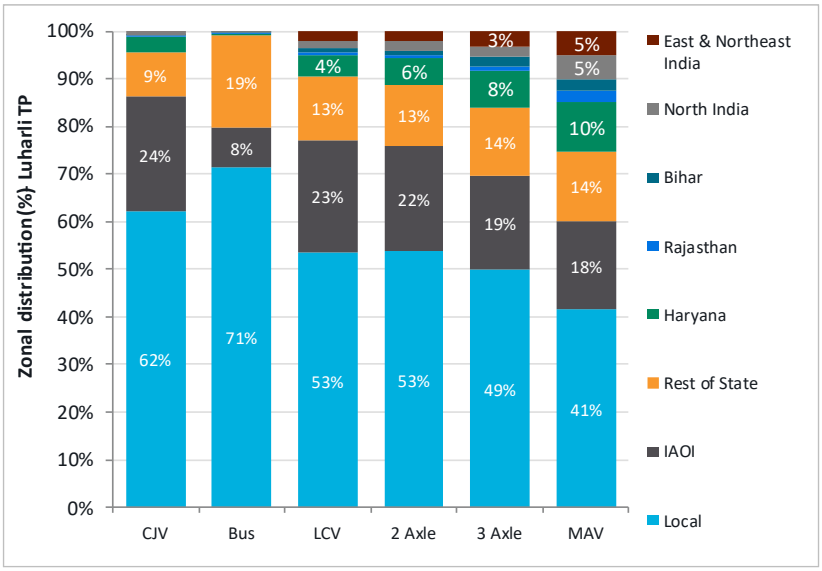
3.50 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence of different regions (as defined in the table above) on traffic volumes crossing at each of the Asset toll plazas. Please note that zonal influence is analysed on trip ends and not trips.

3.51 Figure 3-8 and Figure 3-9 below present the zonal influence of different zones/regions on all the vehicle types crossing the toll plazas. We can see that ‘local’ trips make up the largest share for all vehicle types on TP1 whereas TP2 sees a mix of rest of state and local trips dominating the zonal distribution of the plaza. The influence of local trips is seen decreasing as the size of vehicle type increases, consistent with general trends observed across most highways across the country, given that heavier vehicles travel longer distances. In this context, the high incidence of local trips can be specifically attributed to the urban nature of the Asset and proximity to several industrial and growing urban centres like Ghaziabad, Sikandrabad, Khurja and Aligarh. The distribution also varies between the toll plazas, with TP2 showing lower ‘local’ influence.

3.52 We observe the highest share of 'local’ influence for CJV’s (62%, and 58% at TP1, and TP2 respectively). MAVs see lower but significant ‘local’ influence (41%, and 35% at TP1 and TP2 respectively), which is still much higher than observations made at long-distance corridors across roads in the country. Compared with competing long-distance corridors, this indicates potentially larger share of traffic having one trip end lying on the Asset i.e.,

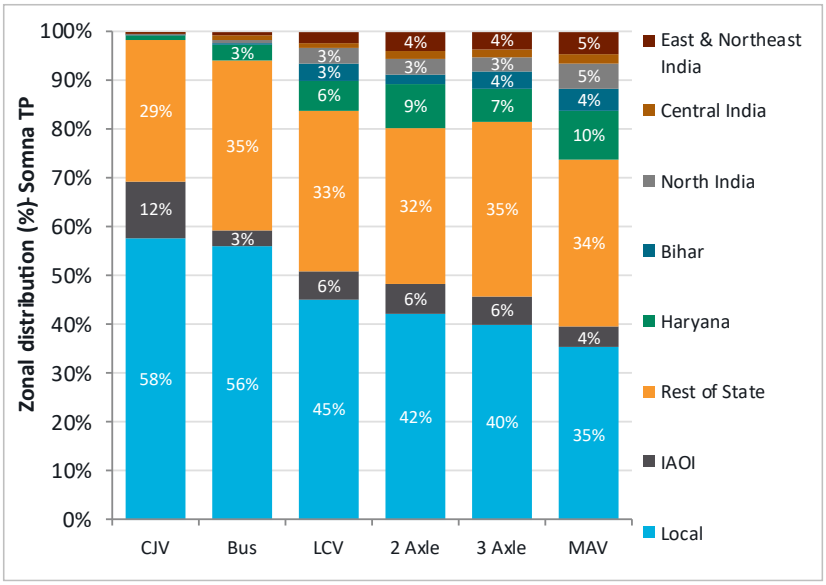
dependent on the regional economy. This is further discussed in the sub-sections presenting top OD pairs and trip length analysis.

Figure 3-8: Zonal influence, TP1 Luharli



Source: Steer analysis of OD data

Figure 3-9: Zonal influence at TP2, Somna



Source: Steer analysis of OD data

3.53 TP2 shows a much greater influence of Rest of State, with all categories showing shares above 29%, with MAVs touching 34%. The zonal distribution of both plazas indicates a high influence of within state trips across all vehicle categories

Internal External analysis

3.54 Internal-External analysis helps in identifying the trips which have both the origin and destination on the Asset (Internal-Internal), both trips end within the state (RoS) or or neither end on the Asset i.e. through trips (External-External). 'Internal' zones are those that were analysed as 'local' in the zonal influence analysis, i.e., lying on the Asset, while 'External' zones are all other zones.

3.55 Figure 3-10 and Figure 3-11below show the distribution of MAV trips based on these categories at both the Asset toll plazas TP1 Luharli and TP2 Somna (respectively). These supplement observations made in the zonal influence analysis presented earlier, but at a higher level of aggregation and at a trip level.

3.56 For CJVs and light vehicles at TP1 Luharli and TP2 Somna, we see that the zonal influence maps to a combination of internal and rest of state trips which means that there are both short-distance and medium-distance trips that contributed to the high 'local' zonal influence. MAVs, on the other hand, show difference between TP1 and TP2, with TP1 having a high share of trips having one 'internal' trip end. On the contrary, TP2 sees a slightly more balanced share between trips having one end 'internal' and one end as 'rest of state'.

3.57 As demonstrated in Tables 3.10 and 3.11, TP1's proximity to industrial zones in Khurja, Sikandrabad, and Bulandshahar results in shorter trip lengths (as detailed in the trip length analysis in Figure 3.14). Consequently, Internal-Internal trips constitute approximately 36% of the traffic on TP1. In contrast, TP2's zonal influence (refer to Figure 3-9), extending to the rest of the state and northeastern states, leads to a higher proportion of rest of state and external trips.

Figure 3-10: Internal-external distribution, TP1 Luharli

	Internal	Rest of State	External
External	14%	6%	6%
Rest of State	6%	1%	5%
Internal	36%	10%	16%

Source: Steer analysis of OD data

Figure 3-11: Internal-external distribution, TP2 Somna

	Internal	Rest of State	External
External	6%	8%	9%
Rest of State	18%	6%	10%
Internal	12%	21%	10%

Source: Steer analysis of OD data

Commodity distribution

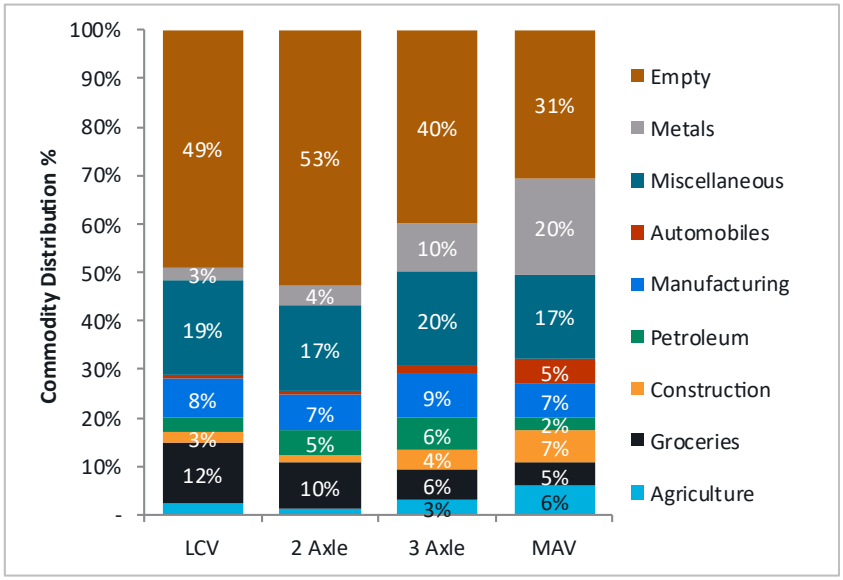
3.58 Figure 3-12 and Figure 3-13 below present the commodity distribution for goods vehicles at TP1 Luharli and TP2 Somna respectively. As also observed during our site visits, we see a high proportion of vehicles that are 'empty', which is consistent with the high 'local' zonal influence and significant shares of 'return' trips observed in our historical analysis section above.

3.59 There is a significant volume of construction, manufacturing, metals and petroleum related commodities on both plazas the Asset along with agricultural materials. Vehicles carrying these products generally have one end of their trips in the industrial areas of Sikandrabad, Ghaziabad, Bulandshahar or Aligarh. The share of construction traffic observed on the Asset can be attributed to cement being transported from Sikandrabad to Delhi NCR region.

3.60 The metal traffic observed on both the toll plazas is primarily iron pipes travelling in both directions from Sikandrabad to Delhi NCR region and from Ghaziabad to Sikandrabad and Aligarh.

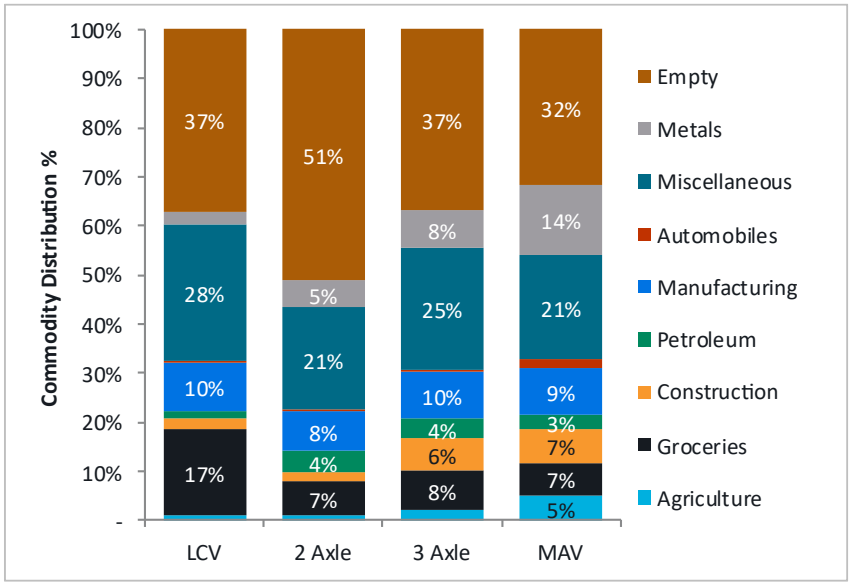
3.61 Somna toll plaza shows more efficient vehicle utilization with a lower share of empty trips and a high concentration of manufacturing and miscellaneous goods across all vehicle types, pointing to a diverse industrial catchment.

Figure 3-12: Commodity distribution, TP1 Luharli



Source: Steer analysis of OD data

Figure 3-13: Commodity distribution, TP2 Somna



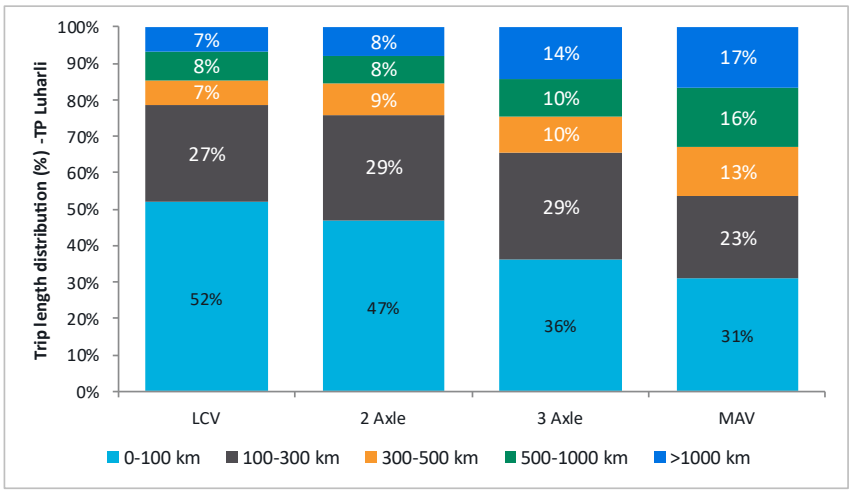
Source: Steer analysis of OD data

Trip length analysis

3.62 Trip-length distribution provides the distance-based profile of various vehicle types. This helps to validate assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into groups – 0-100 km, 100-300 km, 300-500 km, and 500-1000 km and >1,000 km. The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[6]

[6] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: https://developers.google.com/maps/documentation/distance-matrix/start. Travel distance

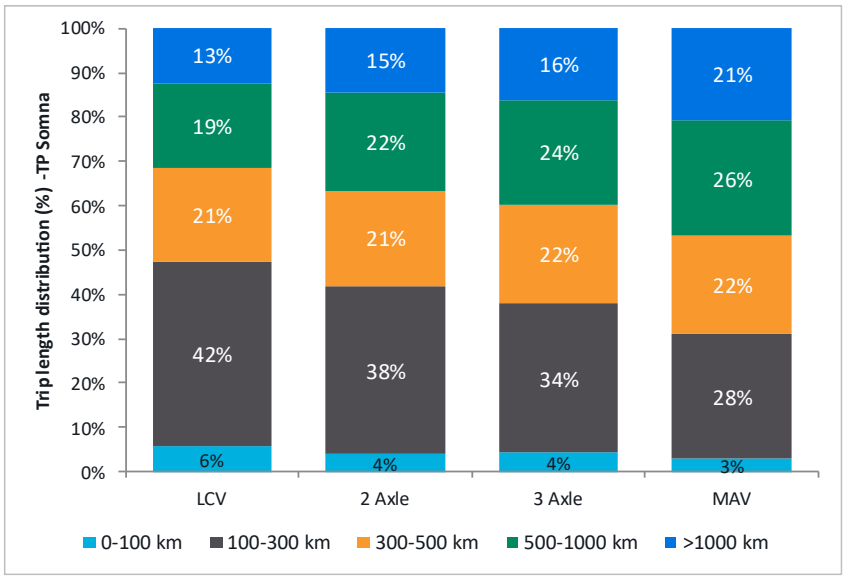
Figure 3-14: Trip length distribution TP1



Source: Steer analysis of OD data

3.63 It is observed that TP1, being closer to urban centres of Sikandrabad, Khurja and Ghaziabad, has a higher share of short distance local trips i.e., travelling within 300kms compared to TP2. The trend is similar in higher vehicle categories as well where one of the trips end is in the Asset region (within Delhi, UP or Haryana). In contrast, TP2 has a comparatively higher share of long-distance trips (i.e., more than 300kms) as evidenced in Figure 3-15 below. These long-distance trips primarily move between Delhi, Haryana and Punjab towards eastern UP regions of Kanpur and further towards north-eastern states such as West Bengal and Bihar.

Figure 3-15: Trip length distribution TP2



Source: Steer analysis of OD data

and time information for driving under various scenarios can be extracted using macro-enabled Excel, R, etc.

Conclusions

3.64 In summary, both TP1 Luharli and TP2 Somna witnessed strong growth in both total and tollable traffic in FY26 due to combination of factors including the impact of increased LoS across the full NH91 corridor from Delhi to Kanpur through (1) the 6 lane expansion of the Asset by October 2023, and (2) completion of 4-laning on the Kanpur-Aligarh stretch of the NH91 by H2FY24. Another contributor to the increase in volumes in FY26 is the temporary diversion of a small volume of traffic destined towards Palwal to cross the plaza due to the closure of NH334D and Aligarh Bypass

3.65 The TVC analysis confirmed the reliability of the Toll Management System (TMS) data, with minimal variation between TVC and TMS counts (1.5% at TP1, (0.4%) at TP2). These differences are within acceptable limits, validating the use of TMS data for base year traffic estimates.

3.66 The OD analyses highlighted significant local influence, particularly at TP1, where local trips form the largest share for most vehicle types as it serves demand being generated by the industrial regions of Dadri, Sikandrabad and Ghaziabad. TP2 on the other hand, shows a greater influence from the 'Rest of State'. MAVs exhibit higher 'local' influence than typical long-distance corridors, suggesting dependence on the regional economy and nearby industrial hubs (such as the Sikandrabad industrial area). Key commodities observed on the Asset include construction materials, manufacturing goods, metals, petroleum and agricultural produce.

3.67 The overall characteristic of the Asset is strategic in nature connecting several key urban and economic activity centres of New Delhi, Ghaziabad, Sikandrabad, Khurja, and Aligarh in the immediate vicinity with wider generators and attractors in Western-Uttar Pradesh, Punjab, Kanpur and Lucknow region, Bihar, and West Bengal also being connected by the Asset. High population density and contiguous development of urban centres are drivers for healthy CJV and Bus traffic growth on the Asset as well.

4 Socio Economic Context

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and,
- Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available.

4.3 In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

National Level

4.4 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 – 1985	2.3%	1.9%	3.8%
1985 – 2000	2.0%	1.7%	2.9%
2000 – 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.5 Table 4.2 shows the evolution of population in the state of Uttar Pradesh and Delhi (containing the Asset), compared to that of the country.

4.6 As the tables show, the populations of both Uttar Pradesh and Delhi have grown at a faster pace, compared to that of India between 2012-2024. As of FY24, Uttar Pradesh holds an 8.1% share in India's population, while Delhi has a 3.8% share.

Table 4.2: Population Growth in Uttar Pradesh, Delhi and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Uttar Pradesh	201.5	237.0	**1.4%**
Delhi	17.0	21.6	**2.0%**
India	1,210	1,395	**1.2%**

Source: National Institution for Transforming India (NITI Aayog) – Census Data

4.7 Due to the complexities of patterns of urbanisation, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

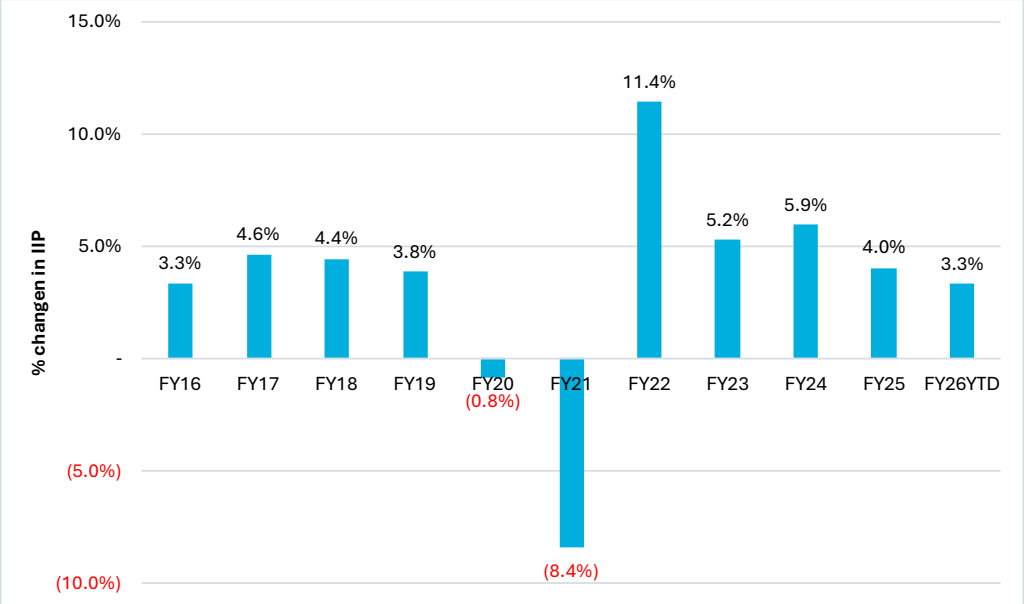
Economic Indicators

Industrial Production

4.1 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.2 The figure below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4%, and FY26YTD (till February 2026) recording 3.3% growth over FY25

Figure 4-1: Annual growth – Index of Industrial Production (FY16-FY26YTD)



Source: Ministry of Statistics and Program Implementation (MoSPI). FY26YTD represents data till Feb'26

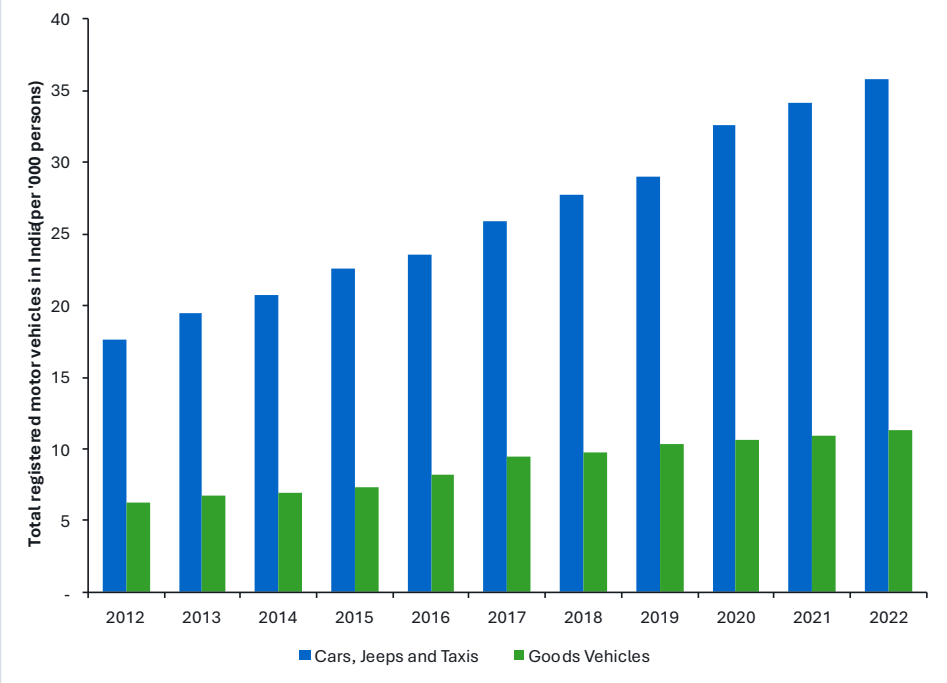
4.3 Since state-level IIP data is not as readily available as national-level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MoSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle Ownership

4.4 The gap in car ownership between India and developed nations remains substantial – with 36 cars/jeeps/taxis and 11 commercial vehicles per thousand people, as of FY22 (the latest year for which official data is available). However, with increasing per capita income levels, a booming economy and the subsequent increase in demand for mobility, the number of registered vehicles has been on a gradual upward trend

4.5 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. Between FY12 and FY22, the CAGR for CJV and goods' vehicles registered in India was 8.6% and 7.3% respectively

Figure 4-2: Total number of registered motor vehicles in India (per 1000 population



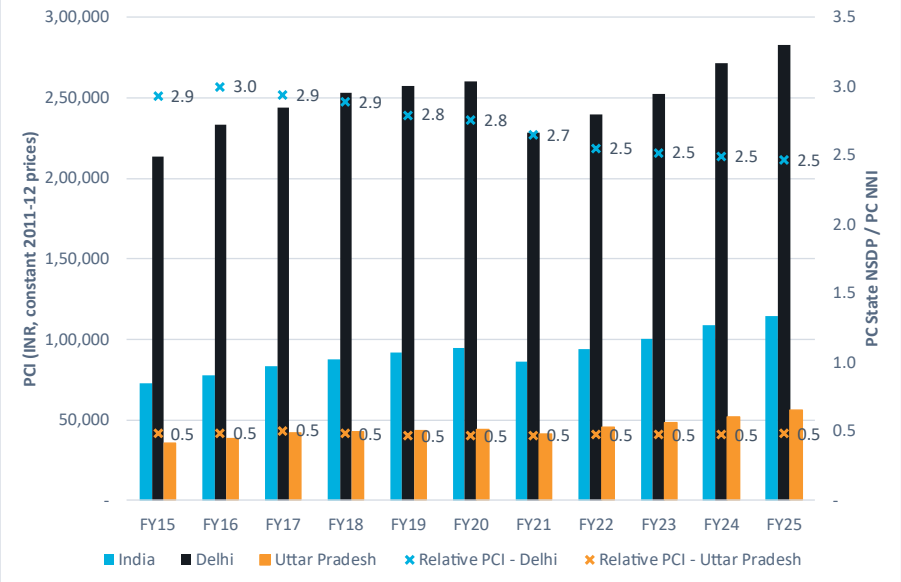
Source: Ministry of Road Transport and Highways (MoRTH)

Per Capita Income (PCI)

4.6 The Asset lies in Uttar Pradesh and Delhi. As shown in Figure 4-3 below, since FY15, the per capita income of Uttar Pradesh has been at roughly 40-50% of the national average. In contrast, the per capita income of Delhi has consistently been much higher – varying between 2-3 times the national average over the period FY15-FY25.

4.7 Traffic on the Asset is influenced by both Delhi and Uttar Pradesh – specifically, the western region of UP, which has grown at a faster rate than the rest of the state in recent years and is expected to continue this trajectory (as discussed in 4.21 below). The higher per capita income of Delhi and the higher growth in western UP indicates sustained economic growth in the region, driving traffic growth on the Asset over time.

Figure 4-3: Relative Per Capita Income (FY15-FY25)



Source: Steer Analysis of MoSPI data

Economic growth

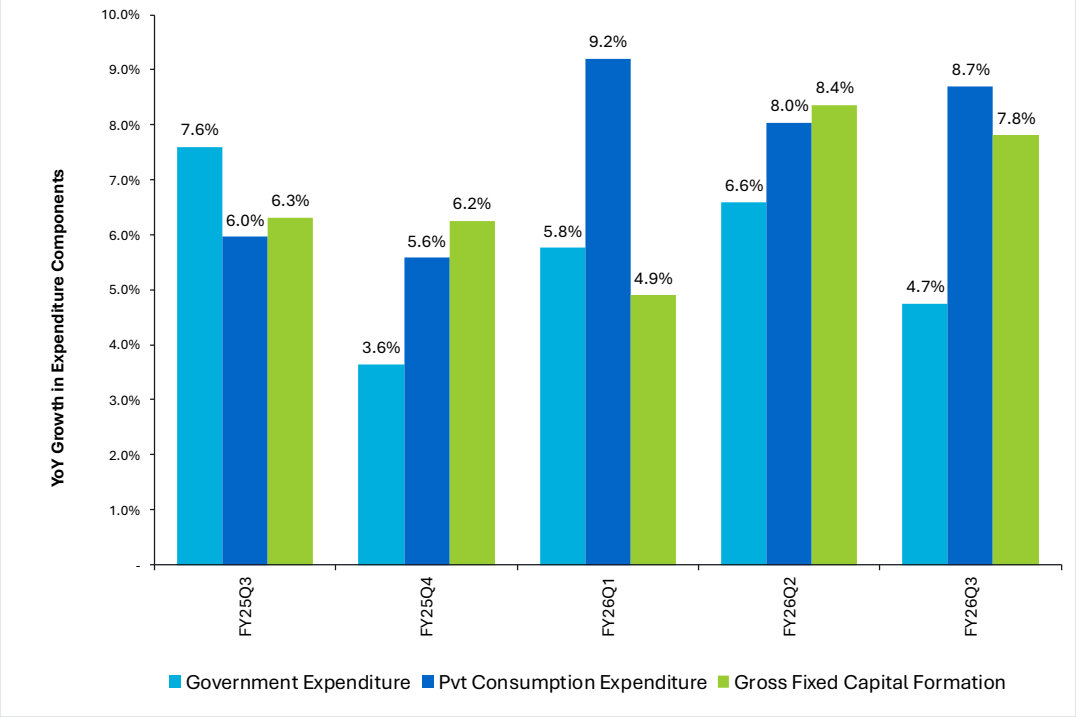
India's Performance

4.8 Following a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q3 GDP at 7.8% over FY25Q3. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[7].

4.9 The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past year (FY25Q3-FY26Q3).

[7] Gov**ernment of India PIB Release (27th February 2026)**

Figure 4-4: YoY growth in expenditure components of GDP

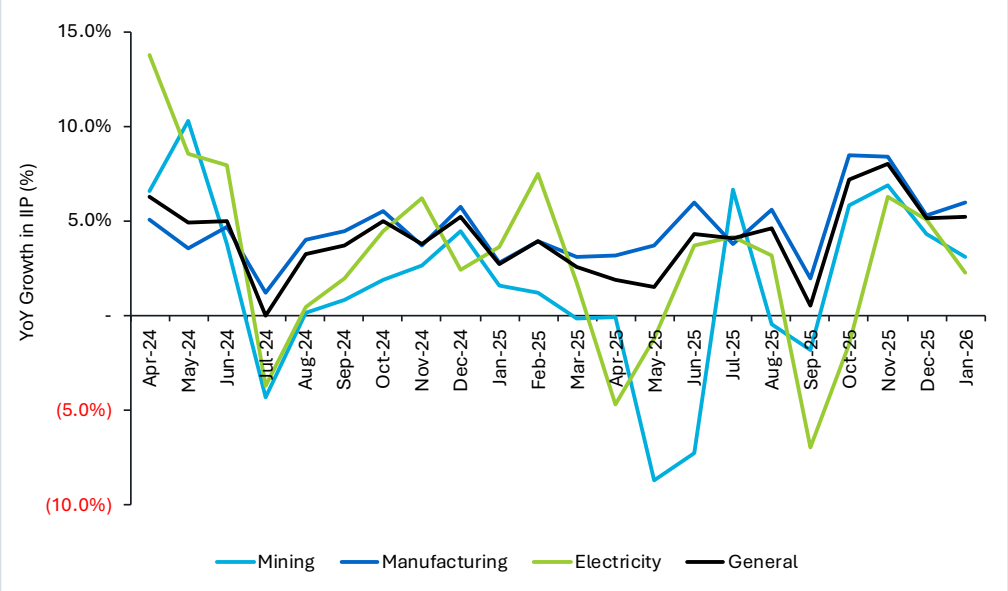


Source: Steer Analysis of MOSPI Data

4.10 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 5.8% growth over FY25Q1 levels.

4.11 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr'25-Feb '26), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

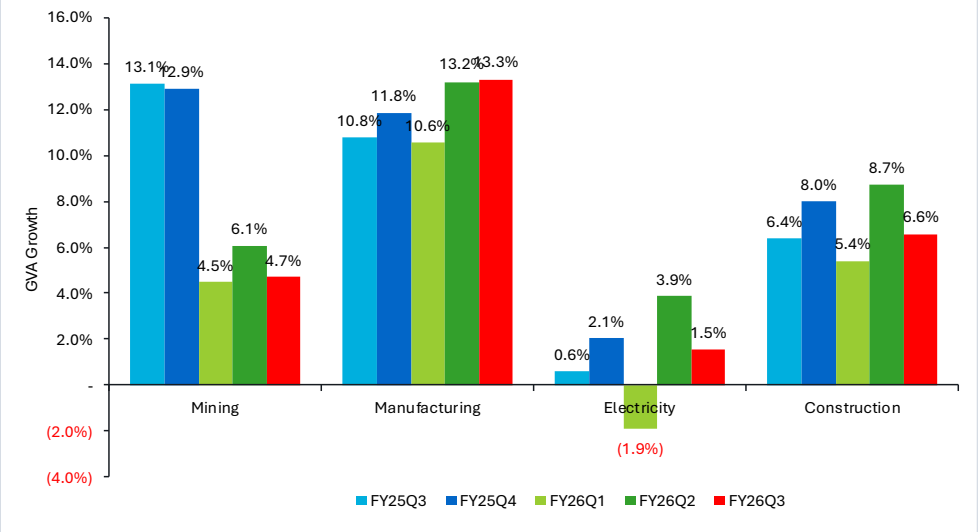
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.12 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

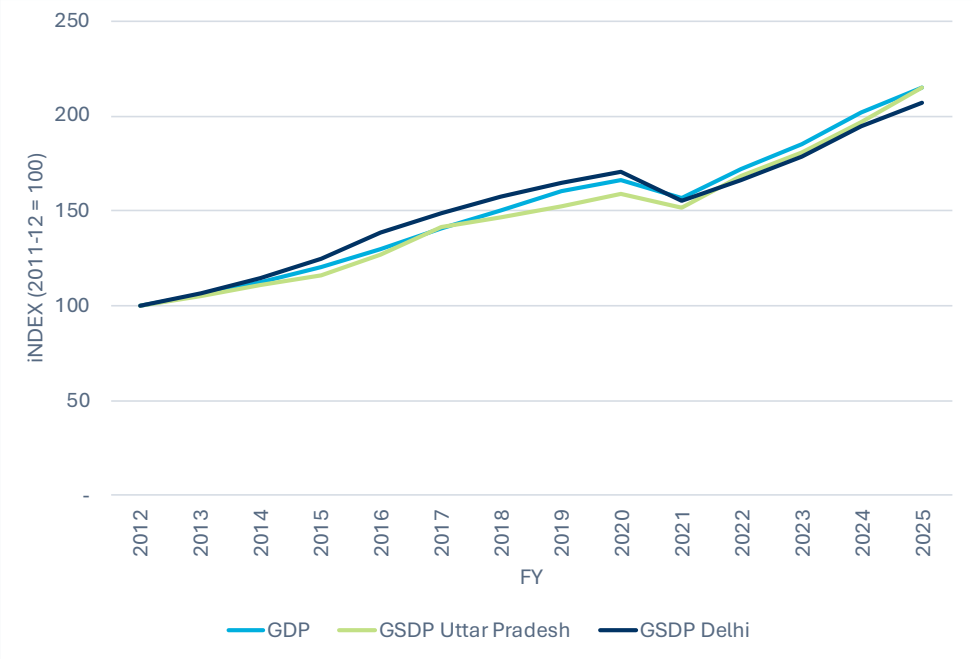
GDP and GSDP Growth

4.13 Figure 4-7 below presents historical growth in Delhi and Uttar Pradesh GSDP, and the GDP of India. Between the period of FY12 and FY25, the Indian economy grew at a CAGR

of 6.1% per year – aided by strong growth in the services/tertiary sector, which grew at a CAGR of 6.9%per year over the same period. UP GSDP and Delhi GSDP grew at 6.1% and 5.8% per year (respectively) between FY12 and FY25 – in step with the national economy.

4.14 As shown in Table 4.2 above, Delhi and UP respectively accounted for 1.5% and 17% of national population in FY24. In terms of national economic contribution, Delhi and Uttar Pradesh contributed approximately 4% and 8% respectively to India's GDP in FY24. Therefore, Delhi's per capita GDP contribution in FY24 far exceeded the same for UP statewide, highlighting the importance of the region in driving consumption demand and regional traffic growth near the Asset.

Figure 4-7: Evolution of Delhi's and Uttar Pradesh's GSDP and national GDP



Source: Ministry of Statistics and Program Implementation (MoSPI)

Economic activity in the state

Uttar Pradesh

4.15 Uttar Pradesh is the most populous state in India with a population of ~237 million people (as of FY24). The state has a large pool of skilled, semi-skilled and unskilled labour. A shown in Figure 4-8 below, the tertiary sector has the highest sectoral contribution (49%) to the state GSVA followed by the secondary (28%) and primary (23%) sectors, as of FY25.

4.16 Uttar Pradesh is considered one of the primary tourist destinations in India, with key tourist attractions being Agra, Varanasi, Mathura and Prayagraj. The state recorded a tourist footfall of 64.90 crore in 2024, a significant increase of over 17 crore in 2023, as per Union Ministry of Tourism[8]. Overall, Uttar Pradesh had an 8.2% contribution to national GDP as per FY24 data by the Ministry of Statistics and Program Implementation.

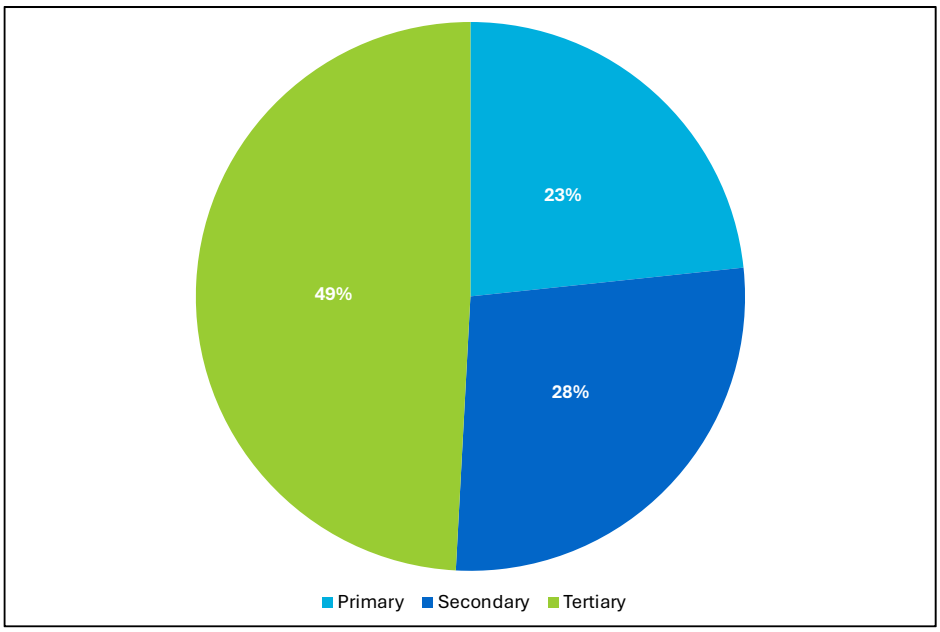
4.17 In terms of secondary sector, the state has key industrial areas in Khurja (Ceramic); Moradabad (Metals); Meerut, Bareilly, Mirzapur and Lucknow (Handloom & Handicrafts);

[8] up-sees-65-crore-tourists-in-2024-over-17-crore-more-from-2023

and Kanpur and Noida (Leather and tannery). The state also has an oil refinery in Mathura, operated by Indian Oil Corporation.

4.18 Uttar Pradesh has very fertile Gangetic land with a large share of population dependent upon agriculture sector for the livelihood. The key primary industries in the state include crop production and horticulture. The state is mainly known for production of wheat, sugarcane, potato and mango.

Figure 4-8: Sectoral contribution to Uttar Pradesh's GSDP as of FY25



Source: Steer Analysis of MoSPI data

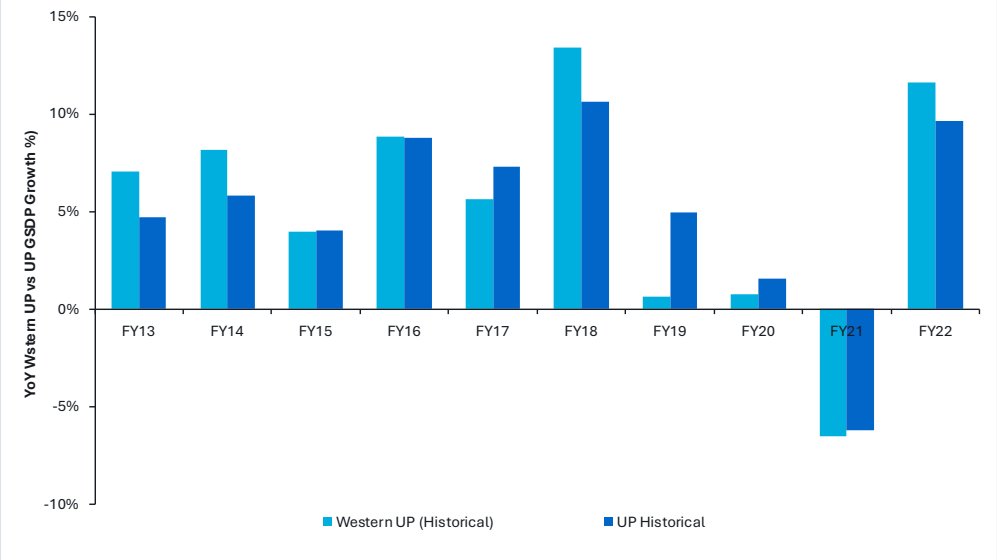
Western UP vs UP GSDP Growth

4.19 Since FY13, growth of Western UP GSDP[9] has remained relatively stable, and in line with UP statewide GSDP growth. In Figure 4-9 below, we see that between FY13 and FY22, GSDP growth in Western UP exceeded that of UP overall in 5 of the 10 years (FY13, FY14, FY18, FY21 and FY22), was consistent with UP in 2 of the 10 years (FY15 and FY16), and was below UP GSDP growth in 3 of the 10 years (FY17, FY19 and FY20). While UP statewide growth is largely influenced by Western UP, in recent years (FY21-22), Western UP GSDP has exhibited growth more sensitive than statewide trends.[10]

[9] The Western UP region consists of 30 districts, prominent among which are Ghaziabad, Gautam Budh Nagar, Agra, Meerut, Mathura and Bareilly. Historically, this collective region has been the more economically developed part of Uttar Pradesh, and as of FY22 accounted for half of the statewide total GSDP.

[10] Steer analysis of data sourced from the Directorate of Economics and Statistics, Uttar Pradesh (**UPDES website**)

Figure 4-9: Western UP vs UP GSDP Growth



Source: Directorate of Economics and Statistics, Uttar Pradesh

4.20 This can be explained due to a combination of policy- and market-driven factors which have contributed to higher growth in the Western region of the state. Some of these major developments pertaining to large-scale infrastructure investments in the region include:

- Delhi – Meerut Expressway[11]
- Ganga Expressway [12]
- Noida International Airport (Jewar Airport) [13]
- Logistics hub in Agra, by the Agra Development Authority [14]
- 'New Noida' initiative by the Uttar Pradesh government [15]

4.21 Between FY12–FY25, the GSDP of Uttar Pradesh grew at a CAGR of 6.1% per year. Over the same period, national GDP grew at 6.1%[16] per year, implying that the long-term elasticity factor of UP GSDP growth to national GDP growth is roughly 1. In this context, as Western UP has exhibited more elastic growth relative to UP state overall in recent years, as well as expectations of strong near-term growth in the Western region driven by large-scale infrastructure and commercial investments, we have assumed the near-term growth forecast for Western UP to be similarly elastic to India's GDP growth forecast.

4.22 Figure below presents the Client-provided forecasts of national (India) GDP growth from FY26 to FY45, and our assumed GSDP forecast for Western Uttar Pradesh over the same period. In the short term, we have assumed GSDP of Western UP to grow at 1.2 times that of national GDP growth forecast, eventually tapering down to a factor of 1.0 over time as it converges to the national growth rate forecast by FY45.

[16] Steer analysis of MoSPI data

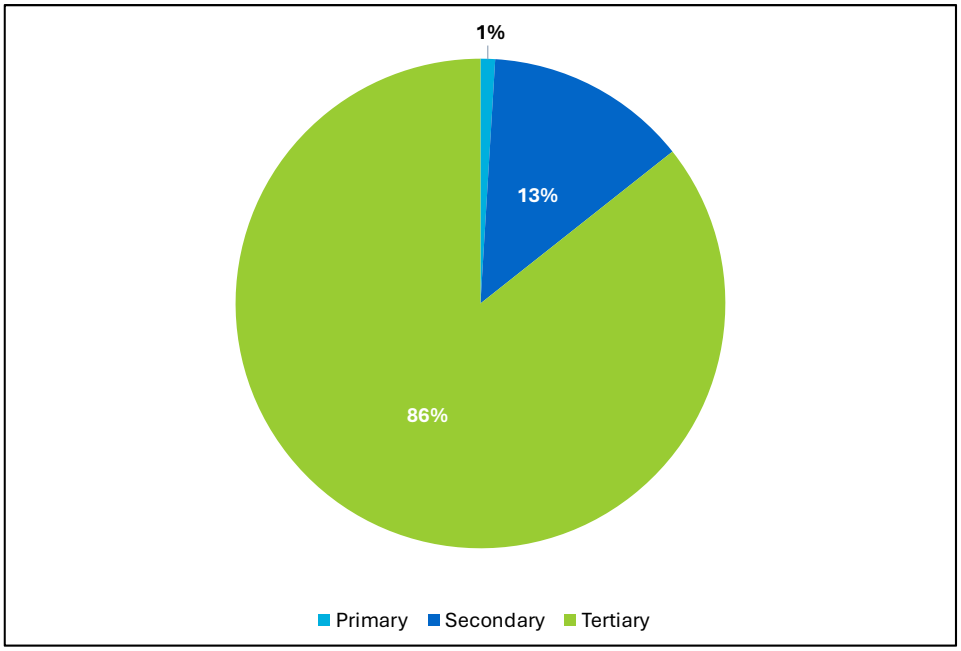
Delhi

4.23 Delhi, the capital city of India, is one of the largest metropolises in the country. In terms of the GSVA composition of Delhi, as shown in Figure 4-10, the tertiary sector has the highest share (86%) followed by the secondary sector (13%) as of FY25.

4.24 The biggest contributors to the tertiary sector in Delhi are tourism, trade, financial services and real estate. Owing to its location, connectivity and rich cultural history, Delhi has always been a prime tourist attraction of the country with key tourist places being India Gate, Lotus Temple, Humayun's Tomb and Akshardham. The Indira Gandhi International Airport of Delhi serves both domestic and international passengers and as of 2024, it was the tenth-busiest airport in the world[17], catering to approximately 72.2 million passengers.

4.25 In terms of secondary sector, NCT of Delhi has key industrial clusters at Narela, Naraina, Okhla and Mayapuri. The primary/agricultural sector accounts for a small share of Delhi's GSVA.

Figure 4-10: Sectoral contribution to Delhi's GSDP in FY25



Source: Steer Analysis Ministry of Statistics and Program Implementation (MoSPI) Data

Forecasts for growth drivers

4.26 Following the discussion in Chapter 4 on the nature of economic activity in the state of Western Uttar Pradesh and in Delhi, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.27 We have based our forecasts of the GSDPs for Western Uttar Pradesh and Delhi based on the forecasts of the GDP of India as provided by the client.

[17] Delhi's IGI airport is the 10th busiest airport in the world: Report | World News - The Indian Express

National GDP

4.28 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[18]

4.29 The Covid-19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23 and 9.2% in FY24, before showing signs of slowdown again in FY25 due to several domestic and external factors. Since H2FY25, the economy has shown strong growth, driven by improved consumer optimism, and growing consumption and investment demand.

4.30 Figure 4-11 below shows Client-provided GDP projections for India. The forecast projects the GDP of India to grow at an average of 6.3% between FY26-FY30 and 5.8% between FY31-FY44, gradually tapering down to 5.2% by FY50. The GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[19] in the medium term.

4.31 We assume the GSDP growth of Delhi to be in line with India's GDP growth throughout the concession period. For our forecast of the GSDP growth of Uttar Pradesh, we have considered the growth expectations for the western region of UP – as opposed to UP state-wide, due to the location of the Asset in the western region of UP. Additionally, we have assumed the GSDP growth of western UP to higher than that of the GDP of India going forward, across the concession period.

4.32 In particular, we expect it to grow at 1.2 times the GDP of India in the short-term, tapering down to be in line with national GDP growth by FY45. This assumption is based on the recent performance of the GSDP of western UP relative to statewide GSDP growth (as discussed in detail in 4.19 above), as well as expectations of continued investment and economic growth in the region owing to a variety of factors.

4.33 There are significant investments expected to take place as part of the UP and Delhi state/regional government plans over the near to medium term (as described in 4.20 above). Given its leading position in industrial investments, western UP is expected to benefit significantly from these future investment plans. In this context, we believe it is

[18] **Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu** (September 2020)

[19] **Survey of Professional Forecasters on Macroeconomic Indicators – Results of the 96th Round (Oct 2025)**

reasonable to assume that Western UP will observe more robust economic growth over the near and medium term relative to UP state overall, and national GDP growth.

4.34 Figure 4-11 below shows the assumed growth forecasts for Western UP and Delhi GSDP, and the GDP of India.

Figure 4-11: GDP-GSDP forecast

5 Traffic growth analysis

Introduction

5.1 In this section, we present our approach, assumptions, and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 To understand the historical traffic trends in relation to these growth drivers, we carried out regression analyses to determine the historical relationship between each major vehicle category and its macroeconomic growth driver at each toll plaza. The dynamics of traffic demand is the dependent variable while the dynamics of one or more identified growth drivers are the independent or explanatory variables.

5.4 Typically, passenger and light commercial vehicle traffic like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state in which the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because most light vehicles tend to travel shorter distances within the state, whereas heavy vehicles typically carry commodities over long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth than more local or regional growth drivers.

FY26 Base year AADT estimates

5.5 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. For this traffic study, we have used FY26 as the base year for generating or future year traffic forecasts for the Asset.

5.6 To establish the base year (FY26) traffic position, we utilised information from various sources including historical traffic data from the Client (FY25 and FY26YTD), latest information on FY26 estimated GDP and GSDP growth (as published by official sources), as well as our own contextual knowledge of the region and wider economy, and transportation network the Asset forms a part of.

Methodology

5.7 The base traffic for FY26 has been estimated using 11 months of actual traffic data (April to February). Each toll plaza's seasonality correction factors were applied on the actual MADTs of Apr-25 to Feb-26 to obtain seasonally corrected estimates for FY26 traffic. An average of these estimates is considered to be the FY26 base traffic.

Seasonal Correction Factors

5.8 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. E.g., it is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affect the freight movement patterns in large parts of the country in the July-September period. In addition to these, there may be other seasonal variations specific to the Asset.

5.9 To normalise for these variations across the year when estimating AADT, Seasonality Correction Factors (SCFs) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF greater than one implies that the traffic for that month is lower than the annual average and vice-versa.

5.10 Table 5.1 and Table 5.2 below present the average of FY23 and FY24 SCFs (TP1) and FY23 SCFs (TP2), used for the estimation of our FY26 base traffic position.

Source: Steer analysis ; FY26YTD includes 11 months of FY26 (Apr – Feb'26), FY26A is adopted base for FY26

5.12 In PCU terms, the FY26A estimates show robust growth at both toll plazas, reflecting our assumption strong growth observed at both plazas through FY26 (Apr – Feb '26) is expected to continue through end of FY26. In PCU terms, we estimate TP1 and TP2 to grow by 20.7% and 21.2% (respectively) over FY25 levels.

5.13 Strong traffic growth on the Asset since FY24 is driven by the expansion of the Asset from four lanes to six lanes in October 2023, which significantly improved the Level of Service (LoS). Additionally, the four-laning of the NH91 Aligarh-Kanpur section, construction on nearby state roads (affecting Somna toll plaza), which extends east of the Asset towards Kanpur, has also improved highway conditions significantly, particularly for long-distance commercial movements.

5.14 Other contributing factors include better traffic reporting and compliance at TP1 from the check plaza that was operational between Aug'23 and Sept '24, continued operations of Wonder Cements' Aligarh Grinding Unit near TP2 since April 2023, the opening of the THDC Thermal Plant in Khurja (Unit 1) in January 2025, and most recently, the opening of Unit 2 in September 2025[20]. TP1, which was recently expanded from an 8-10 lane in-line plaza configuration to a 16-lane staggered (split) plaza configuration (July 2025) is also expected to improve travel times and curb leakage going forward.

Estimation of background elasticities

5.15 Elasticities, in the case of traffic growth, are the relationships between traffic growth and the growth in underlying macroeconomic drivers of traffic. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide forecasts of background traffic growth.

5.16 Typically, we rely on national GDP as a growth driver for 3A/MAV trucks, given their characteristics of travelling across multiple states and carrying varied types of commodities which contribute to national GDP.

5.17 OD analysis reveals a strong link to Delhi and Uttar Pradesh, with approximately 92% of cars and 78% of MAVs at TP1, and 96% of cars and 74% of MAVs at TP2 having one end of their trip in these regions. This contributes to the fact that about 67% of all vehicle traffic

[20] Press Release:Press Information Bureau

on the asset travels within 300kms, suggesting traffic growth is significantly influenced by the Gross State Domestic Product (GSDP) of UP and Delhi. In contrast, the growth in traffic volume for 2-axle, 3-axle, and MAVs, which are key for transporting heavy commodities such as construction materials, manufactured goods, and metals, and make longer distance inter-state trips is more dependent on the national GDP growth.

5.18 Table 5.5 below presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.5: Identified growth drivers to model traffic growth

Vehicle type	TP1 Luharli			TP2 Somna		
	GDP India	GSDP Delhi	GSDP Western UP	GDP India	GSDP Delhi	GSDP Western UP
Car		30%	70%		22%	78%
LCV			100%			100%
Bus			100%			100%
2A	100%			100%		
3A	100%			100%		
MAV	100%			100%		

Source: Steer analysis of Client data; *

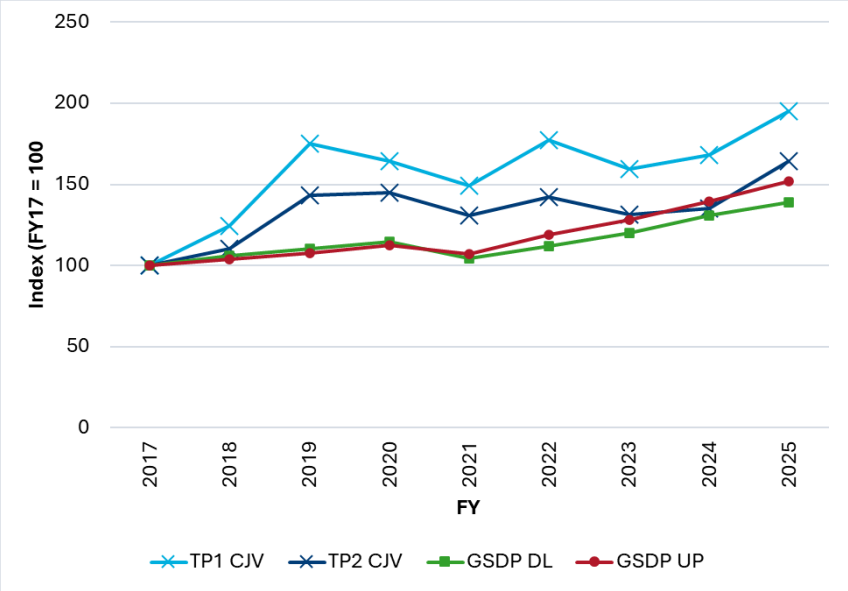
5.19 To understand the traffic growth on the Asset, we undertook regression analysis using traffic data over the period FY17-25 for all vehicle types at both the Asset toll plazas. However, since the Asset has shown variable growth trends every year since FY17, the results of the econometric regression analyses did not yield sufficiently reliable estimates of the elasticities to our assumed underlying growth drivers. We have therefore, analysed trends of each vehicle category and compared them with the growth of key drivers to arrive at assume elasticities, as described below.

CJV

5.20 We see from the OD data that the CJVs primarily cater to regional movements between Ghaziabad, Sikandrabad, Bulandshahr, Delhi, Aligarh and other towns lying on the Asset. In the period of FY17-24, Cars have grown by 6.7% at TP1 and 3.4% at TP2 per year, while the corresponding GSDP growth of Delhi was 1.9% and UP was 1.2% per year. In our understanding this is consistent with the Asset being closer to urban clusters of Delhi NCR and Aligarh, both of which are characterized by high per capita incomes, and levels of car ownership. Hence, we observe slightly higher growth of Cars (higher at TP1) with respect to GSDP.

5.21 Figure 5-1 below shows the relationship between the indexed values of CJV traffic and Uttar Pradesh GSDP at TP1 Luharli and TP2 Somna.

Figure 5-1: Relationship between CJV traffic and Delhi/Uttar Pradesh GSDP, TP1 and TP2



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data. CJV traffic includes reported exemptions.

5.22 Taking note of the positive outlook for passenger traffic on the Asset, regression results on earlier historical years and the urban nature of the Asset, we have assumed a forecast background elasticity of 1.1 for TP1 and 1.0 for TP2 Somna for CJVs going forward.

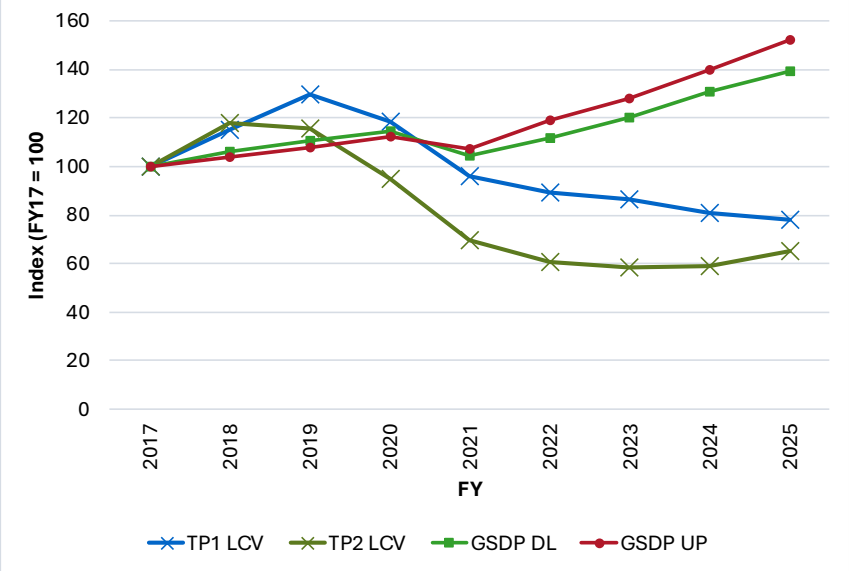
LCV, Bus & 2A

LCV

5.23 Prior to FY19-20, LCV growth on the Asset was strong. However, after FY20, axle load regulations switched in favour of 2A to carry higher tonnage of goods; this shift in preferences impacted LCV traffic growth across the country, and on the Asset as well. The impact of the Covid-19 pandemic in FY21 and reclassification LCVs into CJVs (Mini LCVs) post mandatory FASTag implementation in FY22 also resulted in degrowth of LCVs on the Asset since FY17. Since FY22 however, LCV volumes at both Asset plazas have observed muted or flat growth through FY25. Figure 5-2 below shows the relationship between indexed values of LCVs at both Asset plazas and Uttar Pradesh and Delhi's GSDP.

5.24 LCVs demonstrate more regional travel within Uttar Pradesh and Delhi NCR compared to 3A and MAV vehicles, as validated by the zonal distribution analyses above. As a result, the growth in LCVs at TP1 is modelled using the GSDP of both Uttar Pradesh and Delhi, while growth at TP2 is modelled using only the GSDP of Uttar Pradesh due to its closer proximity. We have assumed LCV will grow at a background elasticity of 0.5 for TP1 Luharli and 0.4 for TP2 Somna.

Figure 5-2: Relationship between LCV traffic and Delhi/Uttar Pradesh GSDP, TP1 and TP2



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

Bus & 2A

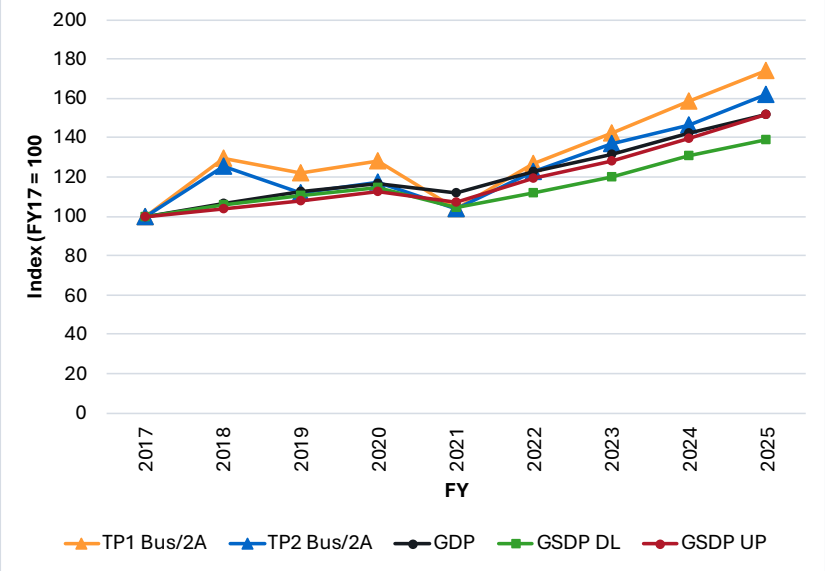
5.25 Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government at different intervals of time. Based on our experience across the country, buses on inter-urban corridors show moderate elasticities of 0.4 to 0.6 with respect to the regional/state GSDP in which the asset is located.

5.26 Given that manufacturing-related commodities tend to take prominence in their commodity distribution, growth in 2A traffic is dependent on industry demand-supply ecosystems in the vicinity of the Asset and across the country. We have thus taken GDP as the growth driver to model the traffic growth in 2As. Compared to lighter trucks like LCVs, 2As have more national or long-distance movements covering several states.

5.27 Due to reporting issues (i.e., Buses and 2As being reported together prior to FY19), we present the relationship between the underlying growth drivers (i.e., GSDP Delhi, UP, and GDP) with the growth trend of the combined Bus/2A volumes in Figure 5-3 below. In terms of their split within the aggregate, Buses and 2As accounted for roughly 50% of the total at both toll plazas (53% of the total at TP1 and 48% of the total at TP2 in FY25).

5.28 Since FY17, Bus/2A volumes have exhibited robust y-o-y growth. Between FY17 and FY25, Bus/2A volumes grew at a CAGR of 7.2% and 6.2% at TP1 and TP2 respectively. Post the impact of the Covid-19 pandemic (FY21), and the mandatory implementation of FASTag (FY21-22), Bus+2A volumes have growth at CAGR of 9-10% per year (at both plazas) between FY23 and FY25. This growth is driven largely off the growth of 2As, as Bus volumes have witnessed a relatively muted growth profile over this period. Therefore, we have assumed an elasticity of 0.40 for Buses (with respect to Western UP/Delhi GSDP), and a more positive elasticity of 0.90 for 2As across both toll plazas on the Asset.

Figure 5-3: Relationship between Bus/2A traffic and Delhi/Uttar Pradesh GSDP and GDP, TP1 and TP2

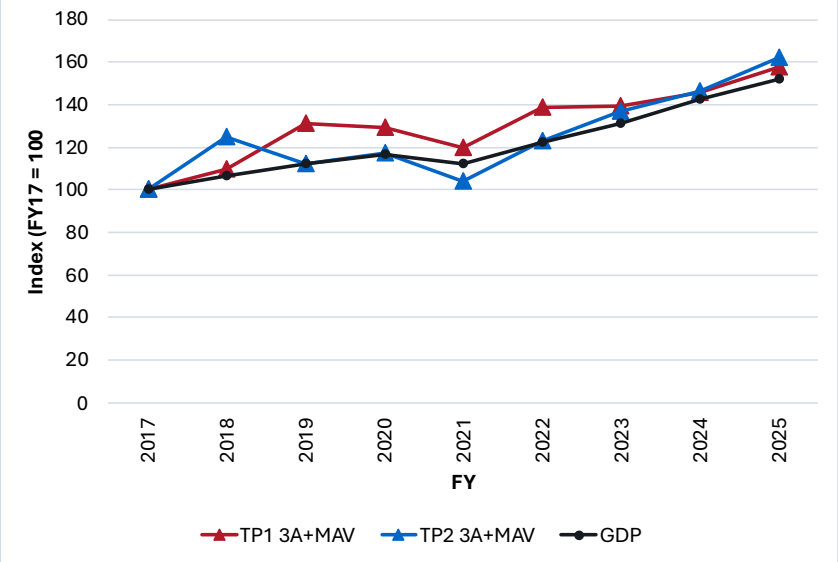


Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

3A/MAV Trucks

5.29 Given that manufacturing-related commodities tend to take prominence in their commodity distribution, growth in 3A and MAV traffic is dependent on industry demand-supply ecosystems in the vicinity of the Asset and across the country. We have thus taken GDP as the growth driver to model the traffic growth in 3As and MAVs. Compared to lighter trucks like LCVs, 3As and MAVs have more national or long-distance movements covering several states. Figure 5-4 below compares growth trends of 3As and MAVs at both TP1 and TP2 and India's GDP.

Figure 5-4: Relationship between 3A+MAV traffic and India GDP, TP1 and TP2



Source: Steer analysis of Client TMS data and publicly available GDP/GSDP data

Forecasts for background elasticities

5.30 Table 5.6 below presents a summary of the results of the regression analysis carried out on the historical toll plaza data and the macroeconomic (GDP/GDSP) growth, along with the assumed forecast elasticities for background traffic growth.

Table 5.6: Comparison of Derived Elasticities and Assumed Elasticities for Forecasting

Vehicle type	Growth driver	History		Forecast
		Derived elasticity	Years considered	Assumed forecast elasticity
TP1 Luharli				
Car	GSDP UP and Delhi	1.35	FY17-FY25	1.1 reducing to 1.0 by FY32
LCV	GSDP UP and Delhi	0.9	FY17-FY25	0.4
Bus	GSDP UP and Delhi	0.5	FY17-FY25	0.4
2A	GDP India	1.2	FY17-FY25	0.9 reducing to 0.8 by FY30
3A+MAV	GDP India	1.0	FY17-FY25	0.2 for 3A
				0.8 for MAV
TP2 Somna				
Car	GSDP UP	0.8	FY17-FY25	1.0 reducing to 0.9 by FY32
LCV	GSDP UP	N/A[21]	FY17-FY25	0.4
Bus	GSDP UP	0.6	FY17-FY25	0.4
2A	GDP India	1.0	FY17-FY25	0.9 reducing to 0.8 by FY30
3A+MAV	GDP India	N/A[21]	FY17-FY25	0.2 for 3A
				0.8 for MAV

Source: Steer analysis

5.31 In recent historical traffic performance across national highway corridors and as discussed in Chapter 3, a notable trend has emerged: there is a discernible shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets performance as well, which has been discussed in detail in the subsequent sections. Due to these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

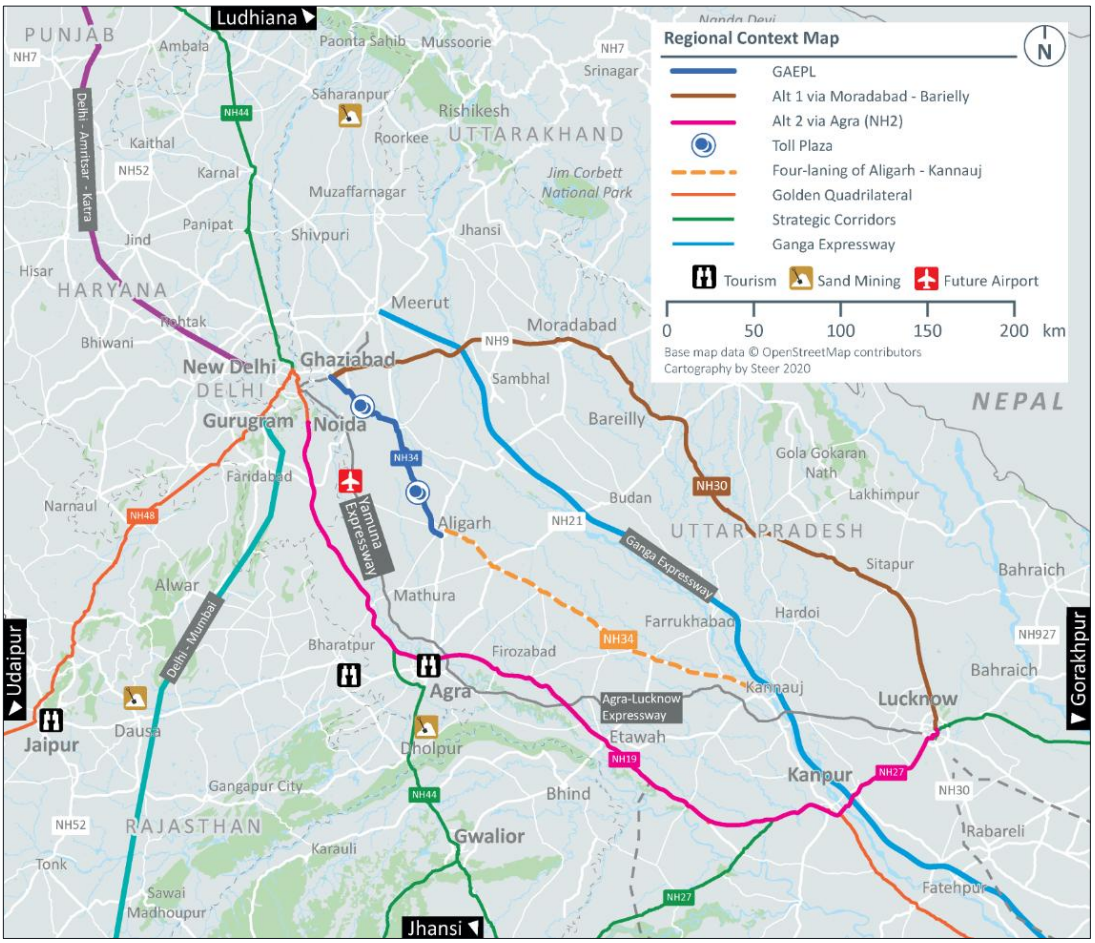
[21] Regression results were invalid.

6 Forecasts: Base year AADT and Impacts

Introduction

6.1 Following the discussion on estimated and assumed forecast background growth rates in the previous chapter, this chapter first deals with the forecasting assumptions around base year AADT and potential impacts on traffic growth on the Asset. Later, it also presents the assumed toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to estimate the forecast revenue based on the forecast traffic. In the final section, the chapter summarises the traffic growth rates for the forecast years.

Figure 6-1: Alternate routes and Asset shown against the regional network context



Source: Steer analysis and cartography

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed earlier in Chapter 2, in order to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network. Figure 6-1 below shows the road network surrounding the Asset.

6.3 A few key network-related and other developments are expected to impact traffic growth on the Asset going forward, including the Ganga Expressway, and the increased movement of fly-ash from recently completed THDC thermal power plants in Khurja (UP) that are accessible via the Asset. The impact of the recently operationalised 16-lane staggered plaza at TP1 was not conclusive from our analysis of daily traffic and ticket segmentation trends between 15-20 July through 14th Aug '25 i.e., prior to the introduction of the Annual Pass, which impacted ticket segmentation trends independently. Therefore, beyond the assumptions relating to Annual Pass adoption rates for FY26 and FY27 onwards for CJVs, we have not assumed further changes to ticket segmentation that may (or may not) be attributable to the operationalisation of the staggered plaza at TP1.

6.4 Table 6.1 below presents the upcoming network/other developments, corresponding alternate/feeder routes, year of completion and indicative direction of impact on the Asset.

Table 6.1: List of network/other developments

S. No.	Development	Route affected/ nature of impact	Year of completion	Impact (+/-)	
				TP1 Luharli	TP2 Somna
1.	Palwa-Aligarh road diversion	Trips between Aligarh and NCR and west that typically use NH334D	FY27	-ve	-ve
2.	Ganga Expressway + Shamli-Gorakhpur Expressway Impact	Trips between Delhi/North and Lucknow/east	FY27	-ve	-ve

Source: Steer analysis; *in our forecasts we have assumed the positive impact of this development on the Asset to be gradual and begin from FY27.

Impact assessment for network/other developments

6.5 The subsections below include a narrative of each of the improvements, as listed in the table above, and impacts associated from each of these. Please note that all traffic volumes for impacts were estimated as impact rates applied on FY26 Base AADT.

Palwal-Aligarh road diversion

6.6 The Palwal-Aligarh stretch of NH334D is currently an undivided 2-laned road. It is undergoing 4-laning currently, due to which traffic from Aligarh is being diverted to NH34, thereby appearing on the Asset. While some of the traffic passes Somna toll plaza (TP2) and takes the Deorau Road to return to NH334D via Chandaus, a portion of such trips pass both plazas and enter NCR from Sikandrabad.

6.7 Once the 4-laning of the Palwal-Aligarh stretch of NH334D is complete, the route would provide the fastest and shortest option for traffic between Aligarh and NCR (and west).

6.8 As the 4-laning is expected to get completed in mid-FY27, a negative impact has been considered on account of the return of Aligarh-NCR trips back to NH334D. Since, fewer such trips pass through Luharli toll plaza, the impact for TP1 is lower in magnitude.

Table 6.2: Impact of Palwal-Aligarh 4-laning

FY27 onwards	TP1	TP2
CJV	(0.5%)	(1.0%)
LCV	(1.6%)	(6.5%)
Bus	(0.1%)	(2.4%)
2A	(0.4%)	(5.2%)
3A	(1.4%)	(2.9%)
MAV	(2.6%)	(4.7%)

Source: Steer analysis of Client OD data and publicly available information.

Ganga Expressway and Shamli-Gorakhpur Expressway Impact

6.9 The Ganga Expressway is a 596-km long greenfield expressway being developed to provide an improved level of service to long-distance traffic between western and eastern India. Competing with the traditional route using the Asset, the upcoming Ganga Expressway could provide faster and unhindered connectivity, as illustrated in Figure 6-1 above[22].

6.10 We have considered North (India)-East (India) movements for this impact for long distance traffic between Delhi/North of Delhi and Lucknow/east of Lucknow towards east, as these have distinct cost comparisons between the Asset corridor and the upcoming expressway. The route through the expressway provides a competitive route for long-distance traffic from Delhi and west to reach Lucknow and east. While toll costs are favourable for the Asset route, distance and time costs are lower on the expressway.

6.11 On the other hand, The Gorakhpur-Shamli Expressway is a planned 700-kilometre, six-lane greenfield corridor connecting Gorakhpur in eastern Uttar Pradesh to Shamli in the western part of the state. Designed to pass through 22 districts and 37 tehsils, this project aims to significantly reduce travel time between the two ends to just 6 hours, cutting the distance by 200 kilometres compared to current routes like the Agra-Lucknow Expressway. The National Highways Authority of India (NHAI) is preparing a detailed project report (DPR), after which land acquisition will commence, paving the way for construction estimated to cost around Rs 35,000 crore. Once operational, the expressway will also enhance connectivity to popular destinations like Haridwar, Dehradun, Mussoorie, and Rishikesh[23]. This expressway will provide an alternate route to vehicles on the Asset and is expected to negatively affect north – east movement of traffic served by the Asset.

6.12 While both the above expressways will effectively serve the same alignment i.e., long-distance movements between the North of India and the East of India, and being parallel

[22] **Development of 'Ganga Expressway'**

[23] **Gorakhpur-Shamli Expressway: 700-Km-Stretch To Connect Haridwar, Dehradun And Mussoorie | Full Details Here**

to the Asset near Delhi and North India, will act as a direct competing route for these movements, the estimated impacts as shown in Table 6.3 below, using a GJC-based logit model is primarily that of the Ganga Expressway as it is expected to become fully operational by FY27-28 (assuming some delay beyond current estimates)[24]. The Shamli Gorakhpur Expressway, while being considered in combination with the Ganga Expressway for this impact estimation is still in its early stages, with its eventual future impact on the Asset less immediate or clear relative to the already under construction and soon-expected-to-open Ganga Expressway.

Table 6.3: Impact of Ganga Expressway and Gorakhpur-Shamli Expressway

	TP1		TP2	
	FY27	FY28	FY27	FY28 Onwards
CJV	(2.5%)	(4.2%)	(3.7%)	(6.2%)
LCV	(4.1%)	(6.9%)	(8.1%)	(13.4%)
2A	(5.0%)	(8.4%)	(10.0%)	(16.6%)
3A	(5.8%)	(9.6%)	(10.8%)	(18.0%)
MAV	(7.9%)	(13.2%)	(15.4%)	(25.6%)

Revenue forecasting assumptions

6.13 To forecast the revenues for a particular financial year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e. traffic (trips) to tickets sold, "toll segmentation" provides the latter i.e. the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Trip Factors

6.14 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in Table 6.4 and Table 6.5 below:

Table 6.4: Trip factors for the forecast years for TP1 Luharli

Vehicle category	CJV	LCV/Mini Bus	Bus	2A	3A	MAV	OSV
Single	1	1	1	1	1	1	1
Return	2	2	2	2	2	2	2
Monthly	59	51	45	42	45	45	45
Local	26	1	1	1	1	1	1
Exemptions	1	1	1	1	1	1	1

Return	2	2	2	2	2	2	2
Monthly	45	45	45	45	45	45	45
Local	32	1	1	1	1	1	1
Exemptions	1	1	1	1	1	1	1

Source: Steer analysis of Client TMS data

6.15 There is no major toll category being charged, apart from the official list of toll categories in the toll notification. This assumes that further changes in toll categories, unless specific discounts are offered, are unlikely.

Toll Segmentation

6.16 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles[25].

6.17 Across multiple assets, the share of annual pass trips has been rising on a monthly basis since August 5. A corresponding decline in other ticket categories including Single and Return journeys has been observed.

6.18 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and post-annual pass segmentation from 15th August 2025 till 28th February 2026. The share of annual pass trips in March 2026 has been assumed to be the same as the share of annual pass trips in the last 10 days of February 2026. For all other vehicle categories, we analysed the historical TMS data split by ticket categories to understand the latest trends in ticket segmentation across both Asset toll plazas. For the traffic and revenue forecast, we have assumed FY26YTD (Apr-Sept '25) segmentation to apply for all non-CJV vehicle categories.

Table 6.6: Forecast toll segmentation, FY26 onwards: Luharli (TP1)

Ticket Type	CJV (FY26	CJV (FY27	Mini LCV	LCV	Bus	2A	3A	MAV

Toll evolution

6.19 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.20 We have used actual toll rates from the FY25 and FY26 WPI toll notifications to validate the modelling of future toll evolution. These forecasts provided by the Client. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client

Table 6.8: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.6%
FY27	0.96 %
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: FY27 onwards WPI print as per Client inputs

Revenue reconciliation

6.21 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue against the modelled revenue at the AADC level. We have reconciled reported revenue with the modelled revenue for the year FY26YTD (Apr – July ’25) to exclude the impact of Annual Pass introduction in Aug ’25 on ticket segmentation distribution for CJVs. To reconcile the revenues, toll rates assumed in the model incorporate the additional 2.185 km within the tolling length of TP2 to make toll revenue calculations across both the TMS data and our

model consistent. For the revenue forecasts, as per Client input, we do not assume the additional tolling length to calculation TP2 toll rates in FY26 and beyond.

6.22 The comparison, as shown in Table 6.9 below, shows that modelled revenue overall is within a variation of 0.9% from the reported revenue for TP1 and 0.5% for TP2. This gives us confidence that the revenues estimated using the traffic data in our forecasts are accurately representing the revenues being reported from the Asset.

Table 6.9: Revenue reconciliation summary (INR Lakhs)

Asset	Modelled AADC	Actual AADC	Difference (%) Modelled vs Actual
	FY26YTD	FY26YTD	
TP-1 Luharli	40.7	40.7	<0.0%
TP-2 Somna	42.3	42.8	(1.0%)

Source: Steer comparison between modelled and reported revenue excluding CJV; FY26YTD here refers to the period prior to introduction of Annual Pass in Aug '25 (i.e., Apr – Feb'26)

Traffic and Revenue forecasts

6.23 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the forecast period for the Asset. Table 6.10 through Table 6.17 below present the AADT/PCU forecast growth rates and forecasted revenue CAGRs on this Asset (at both TP1 and TP2).

Table 6.10: Traffic forecast (With Impacts) for TP1 Luharli

6.24 As presented in Table 6.11 above, Total PCUs at TP1 Luharli is forecasted to grow at 4.9% per year over the remaining life of the concession (FY26-FY40); over the same period, total revenue (incl. AP compensation for CJVs) is forecasted to grow at 9.3% per year. PCU growth at TP2 Somna is forecasted to be 3.5% per year, while total revenue is forecasted to grow at 7.8% per year through the end of FY40. The Asset performance is largely impacted by the commissioning of the Ganga Expressway which is expected to significantly affect commercial traffic movement.

6.25 While the background growth is primarily driven by car growth and MAVs to some extent, the enhanced capacity of the Asset (from earlier 4-lane to current 6-lane), as well as the overall upgradation of the NH91 through Kanpur has significantly improved the attractiveness of the Asset for long-distance east-west movement between Delhi - Kanpur and beyond. This has been captured in the historical growth since FY24 and is expected to continue over the near term given the increasing economic importance of the region.

6.26 The high growth in CJVs on both the Asset plazas is attributable to Asset's proximity to large urban settlements, allowing it to capture local movements near and between Delhi, Ghaziabad, Bulandshahr as well as Lucknow, Kanpur, Etah, and so on. The projected MAV growth (CAGR) for TP1 over the remaining concession period is approximately 3.5%, driven by local freight demand. TP2 is expected to experience a CAGR of around 2.2% per year through FY40, given its role in transporting a significant portion of manufacturing and fast-moving consumer goods (FMCG) traffic between Haryana, Punjab, and Uttar Pradesh, as well as industrial traffic connecting Meerut, Aligarh, Kanpur, and Lucknow.

Upside and Downside cases

Upside and Downside scenario assumptions

6.27 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.28 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local

manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.29 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.18: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.30 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.31 The upside case impacts included in forecasts are summarised in Table 6.19 below.

Table 6.19: Summary of impacts on the Assets – Upside case

Development	Year of Impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Luharli	TP2 Somna

Summary outlook

6.34 Passenger traffic on the Asset primarily serves local needs, connecting the densely populated Delhi NCR, Sikandrabad, Bulandshahr, Khurja, Ghaziabad, Luharli, Somna, and Aligarh over short distances, as well as connecting the medium-to-long distance cities of Meerut, Muzaffarnagar, Kanpur, and Lucknow. The check plaza previously in place contributed to better compliance and fewer exemptions between August 2023 and September 2024, before its vandalism by locals (discussed earlier). The newly operational staggered plaza at TP1 is expected to further curb leakage from forced exemptions.

6.35 This Asset is unique in nature as both the toll plazas have very different traffic profiles serving key strategic movements specific to each of them. TP1 caters to industrial demand generated by local centres of Luharli, Sikandrabad, Ghaziabad, Aligarh, and Dadri while also serving the consumption demand of the Delhi-NCR region. On the other hand, TP2 serves a significant proportion of agricultural, construction and grocery carrying traffic traveling between Haryana, Punjab and Uttar Pradesh along with industrial traffic between Meerut, Aligarh, Kanpur, and Lucknow.

6.36 Following the opening of the TP1 check plaza, traffic volume on the Asset stabilized, leading to improved reporting and compliance. Operational between August 2023 and September 2024 (before getting vandalised by locals), the check plaza contributed to an increase in tollable traffic and a subsequent positive rise in per day collection (as shown in Table 3.6 above). Another major reason which contributes to positive performance of the Asset is the completion of 6 lane expansion of the Asset in October 2023 which significantly improved level of service of the Asset and consequently led to an increase in local traffic of Car, LCV, Buses and MLCV.

6.37 We anticipate a positive future for the Asset, driven by the increasing demand for agricultural and manufacturing goods between the key connecting centers of Delhi NCR and Aligarh/Uttar Pradesh. These essential commodities are projected to experience continued healthy growth in the coming years. Further, to cater to this growing demand and increasing traffic movement, the new 16-lane staggered plaza at TP1 will allow for effective management of heavy traffic movement in peak hours and ease congestion.

6.38 Overall, we see a positive outlook for the region and the Asset, given that it serves major urban centres of Delhi NCR, Ghaziabad, Aligarh, Lucknow and it being the part of the traditional Grand Trunk Road serving the east-west movement across the country. The underlying growth drivers of the corridor are strong and are expected to deliver long term sustained growth.

Appendices

A Detailed forecasts

A.1 Further to the summary of forecasts presented in Chapter 6, this appendix presents detailed forecasts.

Traffic forecasts

A.2 This section presents the detailed traffic forecasts for the forecast period until FY40.

Table A.1: Traffic Forecast (with impacts) over horizon years at TP1 Luharli

	CJV	Mini LCV	LCV	Bus	2A	3A	MAV	AADT	PCU

B Top OD Pairs

B.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. Please see this data for both CJVs and MAVs and OSVs combined below.

TP1 Luharli

Table B.1: CJV and Bus top 10 OD pair shares at TP1 Luharli

	OD Pair	Share
1	Akbapur, Nausana-Ghaziabad	6%
2	Ghaziabad-Sanwli and Sikandrabad	6%
3	Akbapur and Bulandsheher - Delhi	4%
4	Aligarh-Ghaziabad	4%
5	Central part of Delhi-Central part of Hapur district	3%
6	Western part of Agra district-Ghaziabad	3%
7	North-Eastern part of Gautam Buddha Nagar -Central part of Hapur district	3%
8	Ghaziabad-Khurja	2%
9	Aligarh-Central part of Delhi	2%
10	Akbapur and Bulandshahr-North-Eastern part of Gautam Buddha Nagar district	2%

Source: Steer analysis of OD data

Table B.2: 3A and MAV top 10 OD pair shares at TP1 Luharli

	OD Pair	Share
1	Ghaziabad-Sanwli & Sikandrabad	11%
2	Akbapur, Bulandshahr, & Nausana-Ghaziabad	10%
3	Lucknow district-Ghaziabad	3%
4	North-Eastern part of Gautam Buddha Nagar district-Central part of Hapur district	2%

	OD Pair	Share
5	Western part of Agra district-Ghaziabad	2%
6	Northern part of Haryana-Sanwli & Sikandrabad	2%
7	Sanwli & Sikandrabad-Eastern part of Ghaziabad district	2%
8	Central part of Delhi-Central part of Hapur district	2%
9	Aligarh-Ghaziabad	2%
10	Akbapur, Bulandshahr, & Nausana-North-Eastern part of Gautam Buddha Nagar district	2%

Source: Steer analysis of OD data

TP2 Somna

Table B.3: CJV top 10 OD pair shares at TP2 Somna

	OD Pair	Share
1.	Aligarh-Central part of Delhi	11%
2.	Aligarh-Western part of Hapur district	10%
3.	Western part of Agra district-Central part of Delhi	5%
4.	Aligarh-Northern part of Gautam Buddha Nagar district	5%
5.	Aligarh-Ghaziabad	4%
6.	Aligarh-Akbapur, Bulandshahr, & Nausana	4%
7.	Aligarh-Meerut district	3%
8.	Etah, Firozabad, & Mainpuri districts-Central part of Delhi	3%
9.	Aligarh-North-Eastern part of Gautam Buddha Nagar district	3%
10.	Kanpur Nagar district-Central part of Delhi	2%

Source: Steer analysis of OD data

Table B.4: MAV and OSV top 10 OD pair shares at TP2 Somna

	OD Pair	Share
1.	Kanpur Nagar district-Ghaziabad	3%
2.	Aligarh-Western part of Hapur district	2%
3.	Etah, Firozabad, & Mainpuri districts-Northern part of Haryana	2%

	OD Pair	Share
4.	Lucknow district-Ghaziabad	2%
5.	Aligarh-Northern part of Gautam Buddha Nagar district	2%
6.	Aligarh-Ghaziabad	2%
7.	Kanpur Nagar district-Northern part of Gautam Buddha Nagar district	2%
8.	Kanpur Nagar district-Northern part of Haryana	2%
9.	Lucknow district-Central part of Delhi	2%
10.	Kanpur Nagar district-Central part of Delhi	1%

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken based on third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long-term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through February 2026. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate, or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

Glossary Items

Acronym	Meaning
2A/ Truck	2 Axle/ Truck
3A	3 Axle
AADT	Annual Average Daily Traffic
BOT	Build Operate Transfer
CAGR	Compound Annual Growth Rate
CJV	Cars / Jeeps / Vans
COD	Commercial Operations Date
DPR	Detailed Project Report
ETC	Electronic Toll Collection, also referred to as FASTag
FY	Financial Year
GDP	Gross Domestic Product
GSDP	Gross State Domestic Product
HAM	Hybrid Annuity Model
HCM/ EME	Heavy Commercial Vehicles/ Earth Moving Machinery
IE reports	Independent Engineers' reports
INR	Indian Rupees
km	Kilometre
LCV/ LGV	Light Commercial Vehicles/ Light Goods Vehicle
LMV	Light motor vehicles
MADT	Monthly average daily traffic
MAV	Multi Axle Vehicle
NH	National Highway
NHAI	National Highways Authority of India
NHIIMPL	National Highways Infra Investment Managers Private Limited
NSDP	National State Domestic Production
OD	Origin Destination
OSV	Oversized vehicles
PCU	Passenger Car Unit; it is a measure of standard vehicle unit to convert all vehicle classes to a single unit by using PCU factors to compute total traffic on an Asset.
Q1	Quarter 1 of financial year, from April to June
Q2	Quarter 2 of financial year, from July to September
Q3	Quarter 3 of financial year, from October to December
Q4	Quarter 4 of financial year, from January to March
RNP	Registered Number Plate
SCF	Seasonality Correction Factor

Acronym	Meaning
SH	State Highway
T&R	Traffic and Revenue
TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Hazaribagh- Ranchi Toll Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 11 project. This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to February 2026 and latest macro-economic assumptions.

1.2 The Asset Hazaribagh-Ranchi consists of the single toll road section with its own special purpose vehicle (SPV). For this report, we hereafter call the toll plaza on the Asset as TP1.

- Hazaribagh Tollway Limited: HTL: TP1 - Pundag

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between Oct'20 and Mar '26, with FY26 base AADT and forecasts considering data up to Feb'26
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer. The surveys were undertaken in February 2026.
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis

Scope of work	Data source
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research and Steer's in-house experience of working in the vicinity of the Asset
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI); and latest Wholesale Price Index (WPI) trends as shared by the client

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting October 2020 to February 2026. The historical traffic and revenue presented in Chapter 3 considers information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.
  - Concession agreement and toll notifications for FY25 and FY26.
  - Previous studies related to traffic and revenue
  - Steer-commissioned OD survey on 17th Feb 2026 to validate any change in growth drivers and travel patterns.
  - Steer-commissioned TVC survey in 2026 as a part of study in earlier commission.
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position by applying seasonality correction factors (SCFs) on 11 months of actual traffic (Apr-Feb).

- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future.
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this Report

1.7 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases

2 The Asset

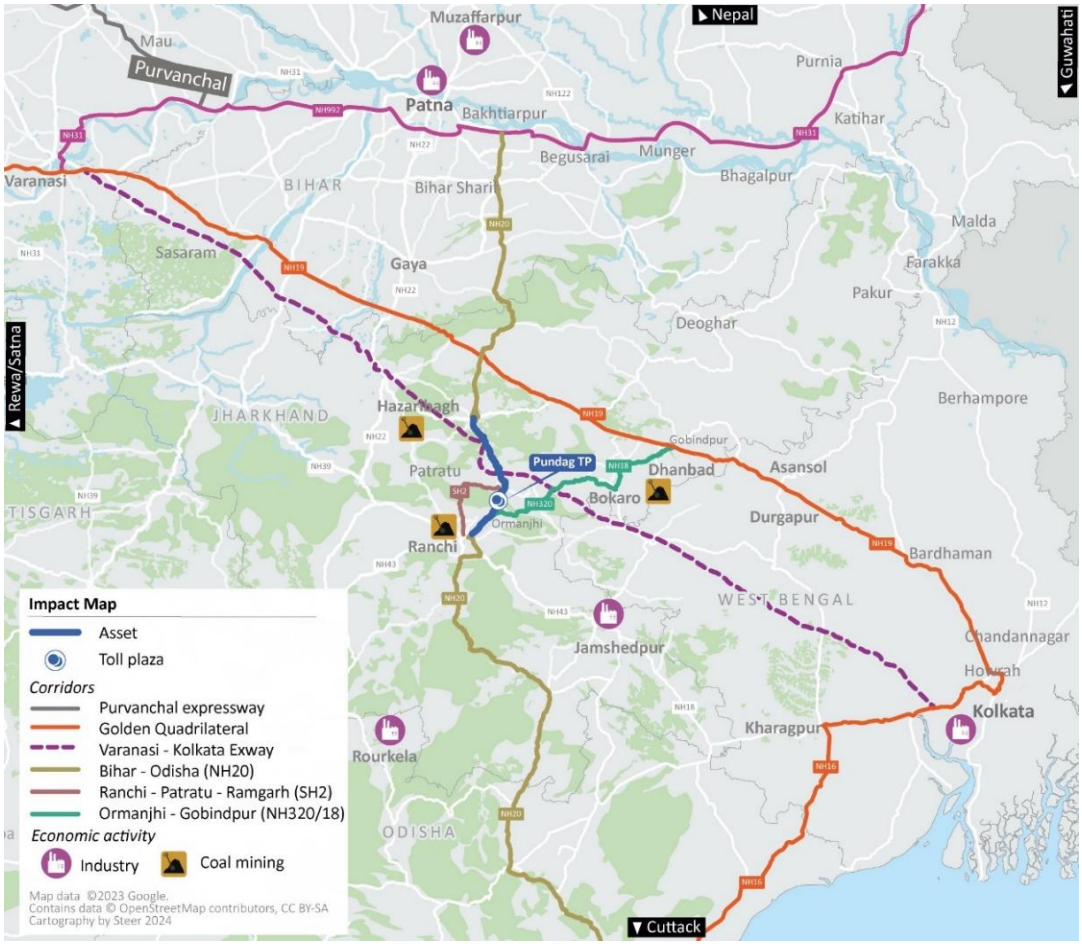
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Jharkhand, connecting Ranchi, the capital of Jharkhand, and Hazaribagh, on the NH 20 (old NH 33). The following figure shows the regional road network in which the Asset is located.

Figure 2.1: Asset location in the regional network context



Source: Steer cartography using OpenStreetMap data

2.3 This Asset primarily caters to three different types of strategic movements:

- **Short-distance trips** including tourism and leisure travel trips between some of the key tourist destinations in Jharkhand. Many CJV users are either local or travel between Ramgarh and Patratu at one end and Ranchi at the other.
- **Medium-distance trips** between Bihar/rest of Jharkhand connecting the mines situated close to the Asset, to industries in Jharkhand. The Asset also transports a significant number of minerals, steel, and related products across the states of Bihar, West Bengal, and Odisha.
- **Long-distance trips** between Bihar/southern West Bengal and southern as well as central states of India.

2.4 The Asset is a 73.79 km long toll road which forms a part of the NH 20 (old NH 33) in Jharkhand. It is a four-lane divided road with one toll plaza, namely, Pundag at Km 100.4. The toll plaza is situated nearer to the Ranchi side of the Asset than to the Hazaribagh side. A detailed view of the Asset and its adjacent area is shown in Figure 2.2.

Figure 2.2: Asset context

Source: Steer Cartography

2.5 About 67% of vehicles on the Asset are CJVs, in FY26YTD which predominantly commute between Ranchi, Ramgarh, Hazaribagh and other local destinations along the Asset. The commercial vehicles on the Asset cover a mix of medium and long distances. Trucks from Jharkhand, Bihar are observed, as well as those from UP, Delhi, Haryana, and Rajasthan.

Concession and tolling details

2.6 The toll plaza on the Asset has been operational since September 2013 and the Client took over the operations in October 2020. The concession period ends in FY51. Table 2.1: Summary of concession presents a summary of the concession.

Table 2.1: Summary of concession

Particulars	Details
State	Jharkhand
Highway and lane configuration	NH 33 (old NH 20), 4-lane divided
Toll plaza	Pundag
Length (km) as per concession agreement, applicable	73.79 km
Commencement of operations	September 2013
Operated by Client since	20th October 2020
Concession period	30 years
Last year of concession	2051

Source: Client data

2.7 The following images show a typical cross section of Asset and its toll plaza.

Figure 2.3: Road cross section of the Asset and closure of Mihir Ghati

Source: Steer site visit

2.8 The toll rates for single category are shown in the following table. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling. Like the other National Highway plazas, the Asset has Single, Return, Local Commercial, Local Personal, Monthly, and Local Monthly tickets.

2.9 Due to general elections in India from Apr-May'24 the toll rates on National highways across the country for next financial year were applicable Jun'24 onwards instead of Apr'24. Tolls of FY26 were updated in Apr'25.

Table 2.2: Single toll rates on the Asset (INR), applicable FY26

Type of Vehicle	Single Journey Fee
	Pundag
CJV	125
LCV	205
Bus/Truck	425
3A	465
HCM/EME/MAV	670
OSV	815

Source: NHAI Revision of User fee Rate w.e.f 01.06.2025

2.10 Apart from single tickets, ticket categories like monthly, local personal and local commercial passes are also available on the Asset.

Key economic activities

2.11 The Asset is situated in Jharkhand, a state rich in mineral resources, contributing 40% to India's mineral reserve. Minerals ranging from iron ore, coal, copper ore, mica, bauxite, Manganese, limestone, China clay, fire clay, graphite, kainite, chromite asbestos, thorium, sillimanite, uranium (Jarsuguda mines, Narwa Pahar) and even gold (Rakha Mines) and silver and several other minerals are found in Jharkhand.

2.12 The presence of large deposits of coal and iron ore in the vicinity has resulted in the concentration of industries, in centres like Jamshedpur, Dhanbad, Bokaro and Ranchi. Particularly, Hazaribagh and Chattra near the Asset contribute significantly to the state's total coal reserves, making coal one of the common commodities being transported on the Asset.

2.13 Jharkhand contributes 20-25% of the total steel produced in India and is home to industries like Tata Steel, Steel Authority of India Limited (SAIL), Jindal Steel and Power Limited (JSPL) etc. TATA Steel in Jamshedpur is 130 km from Ranchi towards the south-east of the Asset and accounts for a significant amount of traffic on the Asset. As per the 2023 report, Tinplate Company of India Limited (TCIL) is investing more than 2000 cr to increase capacity of steel production by 3L Ton per annum[1]. Jindal Steel and Power Limited (JSPL) operates a steel plant as well as power plant in Patratu (40 km from the Asset) and is planning to invest to add 2-2.5 million tonnes per annum to its current capacity of 0.6 million tonnes per annum (wire rod mill) and 1.2 million tonnes per annum (bar mill)2. The expansion is expected to add further steel carrying tollable traffic from Ranchi – Patratu.

2.14 The Ramgarh and Hazaribagh areas are rich in limestone mines. Since the state has reserves of cement grade limestone, the region is well-suited for creating additional capacities. Burnpur Cement's plant in Patratu attracts cement carrying traffic towards the Asset. Burnpur Cement is planning to launch new cement products from the Patratu plant

[1] **TCIL expansion project very important for Jamshedpur and Tata Steel: Narendran | The Avenue Mail**

[2] **https://www.thehindubusinessline.com/companies/jspl-looking-to-set-up-2-25-mtpa-steel-plant-at-patratu-in-jharkhand/article31088657.ece**

as well as increase its capacity utilisation[3]. Further exploration of limestone would help in developing new cement plants and hence, would generate additional traffic on our Asset.

2.15 Dalmia Cement (Bharat) Limited is investing ₹758 crore in Bokaro to expand its cement manufacturing capacity and sustainability initiatives. This includes ₹567 crore for a 2.6 MTPA grinding unit (taking total capacity to 6.3 MTPA), ₹250 crore for a solar power plant, and ₹8 crore for waste management facilities under Ranchi Municipal Corporation. The expansion is expected to generate significant employment and contribute to tollable traffic from Bokaro to Ranchi.[4]

2.16 The industrial area in Hazaribagh is also a significant traffic generator for the Asset. 1500+ industries are present in the industrial area involved in the production of cement, coke, and stone.[5] Although no major tourism spot is present on the Asset, Patratu Thermal Power Station (PTPS) dam at Patratu attracts CJV traffic from Ranchi and nearby areas as a weekend getaway.

Alternate Routes

2.17 For short/medium – distance traffic connecting Ranchi to Ramgarh, there is an alternate route via Patratu on SH 2 that bypasses the toll plaza. The same route also leads to Hazaribagh bypassing the whole Asset. The route is not preferred by truck drivers as it is longer and present on hilly terrain. Also, it is two-laned and passes through uninhabited areas. Hence, no traffic shift and impact are assumed for same.

2.18 For Hazaribagh – Jamshedpur traffic, an alternate route is available at Kothar (near Ramgarh). The alternate is two-lane undivided road connecting Hazaribagh – Jamshedpur. During Steer's site visit it was found that a few local coal carrying trucks from Hazaribagh/Barhi take this route instead of the Asset as the route is shorter (23 kms) and has no tolls. However, the route is known to be affected by local Naxal based insurgency and deemed unsafe. Long distance trucks follow the Asset as it is four-laned throughout the way (till Jamshedpur) and is safer as it doesn't pass through uninhabited areas. Therefore, for the reasons stated above the alternate is not considered to be favourable route for majority of the users.

2.19 As per latest updates, the Oramanjhi-Gola-Bokaro section of NH320B between Bokaro-Ranchi is undergoing construction. It is expected to be a 4 lane road that is largely greenfield with construction expected to get completed in 1-1.5 years. The Mihir Ghati road which is a part of the existing NH320 is currently being 4-laned and is expected to be a part of the NH320B once completed. Due to the closure of the Mihir Ghati section, commercial vehicles' movement on the NH320 has stopped. As a result, Ranchi-Bokaro traffic has started using the Asset, which has led to temporary gain in traffic on the Asset particularly moving between Ranchi and Bokaro.[6] The same is validated from monthly traffic data, wherein increased volume is observed on the plaza starting June'23 onwards.

---

This diverted traffic is expected to return to the alternate road when the construction activity is completed, and the ban is lifted.[7] The detailed impact assumed for the opening of NH320B is presented in Chapter 6 of the report.

2.20 National Highway Authority of India (NHAI) has proposed a 4/6 lane greenfield Varanasi Ranchi-Kolkata expressway connecting Varanasi, Ranchi, and Kolkata. As per the latest information available, the alignment of this expressway is supposed to cross the Asset north of the Ramgarh, and hence, is not expected to take away any traffic which is currently moving from east of Hazaribagh to Ranchi or vice versa. In the long-term, trips between Kolkata and Ranchi can benefit from the improved connectivity and act as a positive on the Asset. Hence, impact of the expressway has been considered in our analysis and has been detailed further in Chapter 6.

2.21 During Steer's site visit to the Asset, no major micro-diversions through local roads were observed close to the toll plazas.

[7] ttps://www.livehindustan.com/jharkhand/bokaro/story-villagers-protest-nh-320-road-construction-in-lepo-mauja-demand-underpass-201741001945578.html

3 Traffic description

Introduction

3.1 This chapter outlines the current traffic and revenues on the Asset, as well as our analysis of origin-destination (OD) data and traffic count data. This covers data which was collected as a part of this study and previous studies, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

3.4 The below sections present historical traffic and revenue information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.

PCU Factor assumption

3.5 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2026 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
Mini LCV	1.0
LCV	1.5
Bus	3.0
2A	3.0
3A	3.0
MAV*	3.75

OSV	4.5

Source: Steer analysis, * Rigid-Trailer PCU calculated using TVC splits of such vehicle types

Historical trends of traffic

3.1 The following table illustrates the traffic data over the period of 6 years from October 2020 – February 2026 (provided by the Client) at a plaza level. There is lack of long-term historical data available on the Asset since tolling was started by the client only in October 2020 and the available years of data, FY21 and FY22 were impacted by COVID-19 related restrictions. Starting FY23 traffic on the Asset has started to get normalised with temporary traffic gain starting FY23 due to construction of alternate Oramanjhi- Gola-Bokaro Section.

Table 3.2: Annual Average Daily Traffic (AADT) at TP1 Pundag

Vehicle category	FY21*	FY22	FY23	FY24	FY25	FY26	CAGR FY23-26
CJV	9,186	8,516	8,935	9,879	10,928	12,401	11.5%
LCV	859	467	445	488	363	386	(4.6%)

PCU	**21,492**	**19,803**	**21,178**	**23,840**	**28,199**	**31,507**	**14.2%**

Source: Steer analysis of Client data, (FY21* includes 6 months of data from Oct'20 to Mar'21); FY26 AADT represents the full year actual (April to March)

Table 3.3: Historical Tollable Traffic at TP1 Pundag

Vehicle category	FY21*	FY22	FY23	FY24	FY25	FY26	CAGR FY23-26
CJV	8,010	7,770	8,172	9,013	9,905	11,224	11.2%
LCV	862	460	442	484	357	381	(4.8%)
Bus	668	441	578	588	772	909	16.3%
2A	501	568	665	832	1,007	1,059	16.8%
3A	514	449	473	526	550	570	6.4%
MAV	1,690	1,624	1,687	1,948	2,551	2,880	19.5%
OSV	4	1	2	2	2	2	
Tollable AADT	**12,249**	**11,312**	**12,019**	**13,392**	**15,144**	**17,025**	**12.3%**
Tollable PCU	**20,711**	**18,932**	**20,322**	**22,895**	**27,009**	**30,224**	**14.2%**

Source: Steer analysis of Client data, (FY21* includes 6 months of data from Oct'20 to Mar'21); FY26 AADT represents the full year actual (April to March)

3.6 CJVs have the dominant share in traffic, comprising more than ~67% share in FY26 due to the presence of large urban centres close to the Asset like Ranchi, Hazaribagh and Ramgarh Cantt, which attracts large quantum of CJV traffic. Vehicles from nearby urban settlements in the influence area like Bokaro, Patratu, Jamshedpur also use this Asset. This is further validated by the analysis of the OD data discussed later.

3.7 As can be seen from Table 3.2, the CJV traffic has increased from ~8,900 AADT in FY23 to ~12,400 AADT in FY26. Whereas the MAV volume has increased from the earlier range of by CAGR 19.5% between FY23 and FY26. This volume increase is mainly driven by temporary traffic shift on the Asset due to the closure of the Mihir Ghati on NH320, which has led to shift of Ranchi-Bokaro trips to the Asset as mentioned in Chapter 2. Once the construction of NH320B is completed, seamless connectivity between Ranchi and Bokaro will be established; as a result, a shift of Ranchi-Bokaro trips are expected to take place from the Asset to NH320B.

3.8 Furthermore, effective May 2024, minibuses previously tolled as LCVs have been reclassified under the bus category. This reclassification is based on a passenger count system, replacing the earlier gross vehicle weight-based classification. Travel patterns in FY25 and FY26 remain largely consistent.

3.9 The trend of tollable traffic on the Asset has largely followed that of total traffic. The Asset has recorded 14.2% tollable PCU CAGR.

3.10 It is seen that the exemption volume in CJV is consistent ~800-1000 vehicles historically with no major change, as seen in Table 3.3.

3.11 The MAV traffic on the Asset is largely influenced by the mineral industries along its alignment, which also contributes to the overall stability of MAV volumes across different time periods.

3.12 The steel industry has seen slowdown over the last couple of years first due to Covid19 related disruptions, slowdown in demand for steel in China, and subsequent high inflation. Recent evidence from various industry players suggests a rebound in Steel production and consumption led by economic activity and urbanization which is expected to boost demand for steel in India to between 240-260 million metric tons by 2035. [8] [9]

3.13 These factors support the growth prospects of the Steel related industry and traffic in the future. Beyond these natural growth factors, higher than usual growth was observed on Asset due to the work on the alternate NH320 as mentioned earlier.

Historical Revenue

3.14 The following table shows the total revenue (in INR Crores) and AADC (Annual Average Daily Collection; in INR Lakhs) by vehicle type at the toll plaza for FY21 to FY26YTD.

Table 3.4: Revenue (INR Crores) and AADC (in INR Lakhs) by vehicle type at TP1 Pundag

Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; AADC represents Average Annual Daily Collection; FY26 represents full year actual (April to March).

3.15 The MAVs are the biggest revenue contributor on the Asset followed by CJVs. Lower per day collection in FY22 can be attributed to COVID-19 with restricted traffic movements. FY21 and FY23 recorded the similar average per day collection of INR 22 lakh. AADC in FY25 and FY26 increased by 21% and 16% respectively due to incremental traffic gain on the plaza as construction of NH320B commenced and Mihir Ghati was closed.

Toll Frequencies

3.1 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the client. The most common ticket categories observed on a typical National Highway are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these passes instead of evading toll.

3.2 The following are the types of tickets being sold at the plazas of the Asset.

Table 3.5: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows for a return journey within a day with a 50% discount on the return trip.
Monthly Pass	Discounted single entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.3 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For some Assets, the Exemption and violations are at time reported together.

3.4 Generally, over the period the shares of single/return/monthly tickets tend to stabilise within 2-3 years of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns.

3.5 Further, FY21 was impacted due to the mandatory implementation of FASTag as a mode of payment, where users were now paying via an online payment system instead of cash payments at the toll plaza. Additionally, in FY22 traffic and travel patterns were impacted by the second wave of COVID-19 in Q1 and Q2. With FY21 and FY22 being impacted these external events, the segmentation began to stabilise from FY23 onwards and reached steady state starting FY24.

Introduction of Annual pass for CJVs

3.6 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.7 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

The Annual Pass aims to:

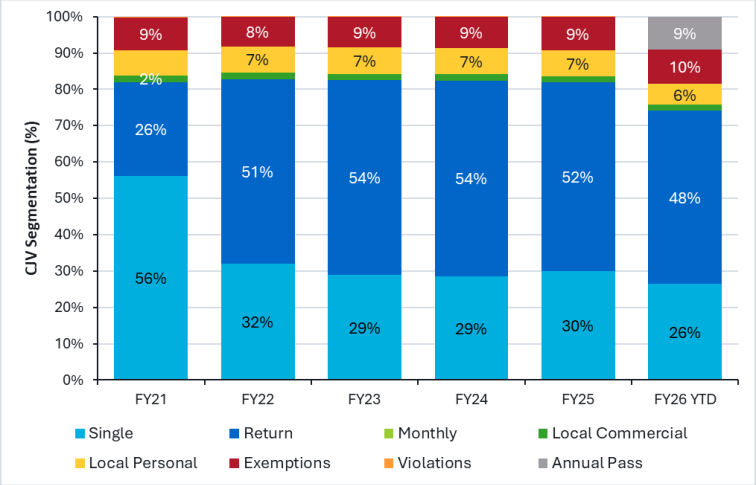
- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll roads.

Share of traffic by payment type

3.8 As shown in Figure 3.1 from the period of FY26YTD, almost half of the CJVs paid for return tickets, and the remainder ticket-share being made up of single journeys, annual pass, local passes, and exemptions. High CJV return trips could be attributed to the travel pattern of the daily commuters between Ramgarh and Ranchi. The toll frequencies for CJV have largely remained the same since FY23.

3.9 Annual Passes were introduced for CJVs from 15 August 2025. At the Asset, these trips primarily shifted from single and return ticket categories, with exemptions and local person pass trips being at the same levels as FY25.

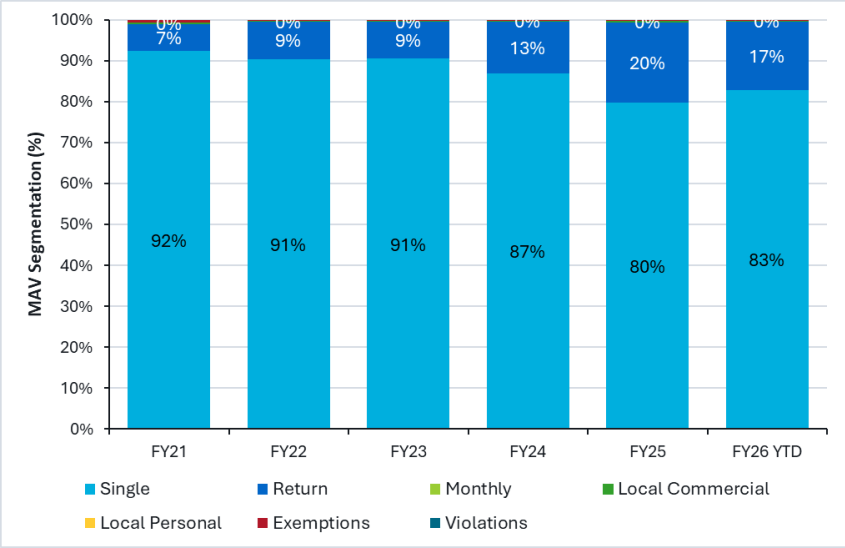
Figure 3.1: Ticket segmentation for CJV at TP1 Pundag



Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; FY26YTD is for 11 months between April and February 2026

3.10 MAVs are observed to have high share of single tickets since FY21 which is aligned to observation of MAVs doing medium to long distance trips on the Asset. As discussed, and validated from the OD data, around 54% of the MAVs on the Asset travel >500 kms. A slight increase in return tickets is visible due to implementation of FASTag, allowing trucks to avail return journey discounts if they return within 24 hrs. In addition to this, FY24 and FY25 has observed increase in return tickets primarily could be due to MAVs carrying construction material such as cement, sand, etc. for the ongoing construction of NH320. Ranchi, Ramgarh and Patna are the major trip generators for the MAV traffic.

Figure 3.2: Ticket segmentation for MAV at TP1 Pundag



Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; FY26YTD is for 11 months between April and February 2026

3.11 For FY26YTD, the MAV segmentation observes increase in the single tickets.

3.12 Refer below to the table for FY26YTD segmentation for LCV, Bus, 2A and 3A category:

Table 3.6: Ticket segmentation for LCV, Bus, 2A and 3A

Ticket Category	LCV	Bus	2A	3A
Single	44.7%	8.8%	64.3%	66.4%
Return	49.9%	89.6%	34.0%	30.9%
Local commercial	4.2%	0.8%	0.1%	1.7%
Exemption	1.2%	0.7%	1.6%	1.0%

Source: Steer analysis of Client data

Data Collection exercise

3.13 As mentioned previously, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed in the table below. Both OD surveys and TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.7: Data collection schedule

TP	3-day videography-based TVC			1-day OD survey			
	Start date	End date	Time (hrs)	Start date	Start time	End Date	End Time
TP1 Pundag	20th Feb 2026	22nd Feb 2026	0000-2359	17th Feb 2026	0800 hours	18th Feb 2026	0800 hours

Source: Steer analysis

3.14 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, to fully understand the impact of this weekly fluctuation on the Asset, we collected seven-day counts at the toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.15 Taking an average of the three-day TVC counts (20th Feb – 22nd Feb 2026, 0000-2359), we obtained the following weekly average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Table 3.8: WADT from TVC counts

Toll Plaza	CJV	LCV	Mini LCV	Bus	2A	3A	MAV	Total
TP1 Pundag	10,936	1,487	1,646	981	948	630	3,509	**20,146**

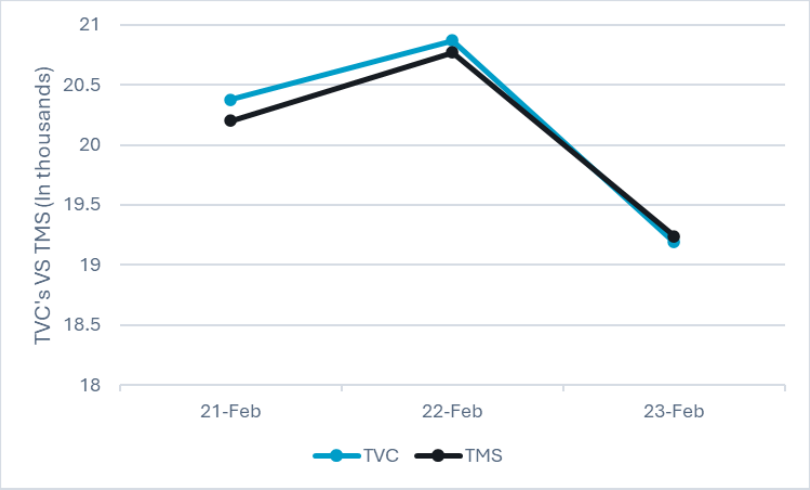
Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.16 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those days, as provided by the Client.

3.17 The following figures show the comparison between the daily traffic observed by TVC and TMS for the toll plaza.

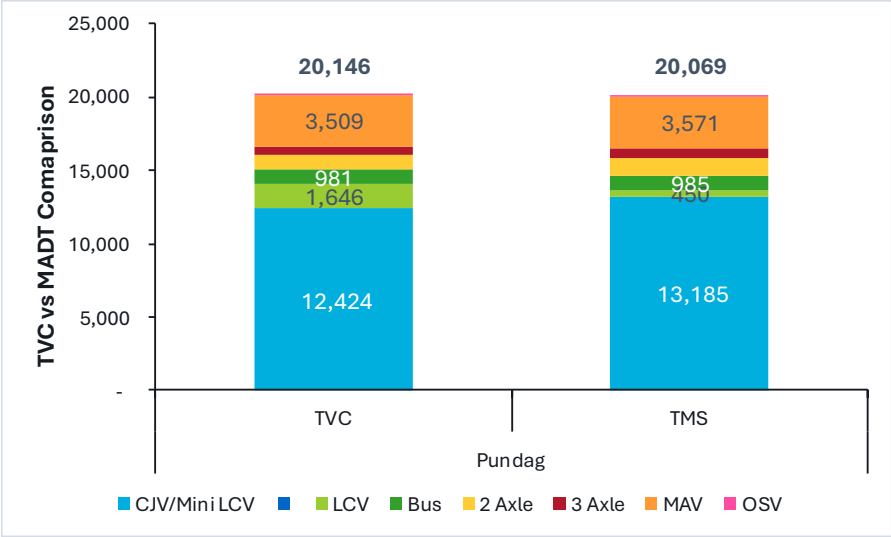
Figure 3.3: Comparison between TVC and TMS daily traffic data on TP1 Pundag



Source: Steer analysis of TVC and Client TMS data

3.18 The figure below compares the shares of vehicle types at both toll plazas observed by the TVC and TMS data. As can be seen, the total TMS count was found to be ~0.4% lower than the TVC count recorded for the same period. The differences within vehicle categories can be attributed to common misclassification of vehicle categories.

Figure 3.4: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.19 Considering the variation between the TVC and TMS is 0.4%, our TVC-TMS analysis gives us confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

Key findings of origin-destination analysis

Overview

3.20 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. As mentioned previously, the OD analysis presented here has been based on the data collected on 17th-18th Feb 2026.

3.21 We have analysed the regional drivers of demand based on the following analyses:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.22 While zonal analysis and the list of top OD pairs help to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.23 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TMS data) during the same time period. The table below presents the sample rates for key vehicle type aggregations at the toll plaza.

Table 3.9: Sample rates for OD data

Vehicle type	TP1 Pundag
Passenger (CJV+Bus)	20.6%
Goods (LCV+2A+3A+MAV+OSV)	74.1%

Source: Steer analysis of OD data

Zone categories

3.24 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in the table below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Asset being studied.

Table 3.10: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.

Aggregate Zone	Description
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
East & Northeast India	West Bengal, Jharkhand, and Northeast Indian states
Bihar	Bihar (Including Patna etc.)
Odisha	Delhi State, including New Delhi
South India	Tamil Nadu, Karnataka, Kerala, Andhra Pradesh
North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir
Central India	Madhya Pradesh, Chhattisgarh
West India	Rajasthan, Gujarat
Delhi	Delhi State, including New Delhi
Outside of India	Bangladesh, Nepal etc.

Source: Steer analysis

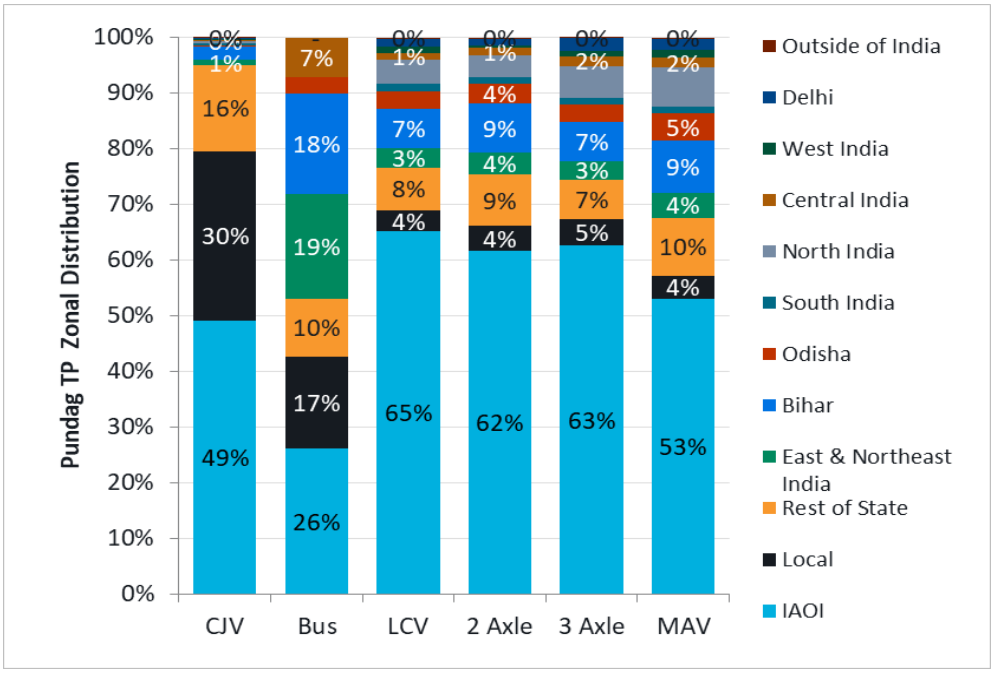
Zonal influence

3.25 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence[10] at each toll plaza of each Asset, based on zonal aggregation listed in the previous sub-section. it should be noted that zonal influence is analysed on trip ends and not trips.

3.26 From the figures below, it can be observed that the plaza has high share of Local/IAOI trips with 57% for MAVs and 79% for CJVs. 3A and MAV trips are comparable with higher proportion of local trips given the presence of coal mines and large-scale industries close to the Asset. We see a high share of Bihar and East and Northeast India in 2A, 3A and MAV zonal influence. This also shows that the Asset serves to connect the eastern part of the country to the northern parts. The neighbouring state of Bihar also serves as a major influence across vehicle categories with 7-9% of goods vehicles influenced by it.

[10] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Figure 3.5: Zonal influence at TP1 Pundag



Source: Steer analysis of OD data

Internal External analysis

3.27 Internal-External analysis helps in identifying the trips which have both the origin and destination on the Asset (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e., lying on the Asset or in the "immediate area of influence", 'Rest of State' zones are those origins and destinations aggregated as "Rest of State" in the zonal analysis while 'External' zones are all other zones.

3.28 Figure 3.6 below show the distribution of trips based on these categories. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.29 We see that I-I, I-E and, E-I trips dominate for MAV category suggesting Jharkhand as a significant origin of truck traffic. Presence of big industries near the Asset as well as in the state can be the reason behind this high number of Internal trips. This proportion also suggests that the trips are local in nature. 12% external-external trips validates the assertion that the Asset is a major connector for locations in East and North East of India with North India.

Figure 3.6 Internal-external distribution at TP1 Pundag

	Internal	Rest of State	External
External	17%	3%	12%
Rest of State	5%	1%	4%
Internal	34%	8%	17%

Source: Steer analysis of OD data

Commodity distribution

3.30 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the table below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.11: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane,Maize etc.)	AGR	AGR
Cattle Food / Livestock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread,cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids,Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood,Cork & Wood Products, Furn	WUD	

Commodity Description	Code	Combined codes used for charts
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, House hold items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

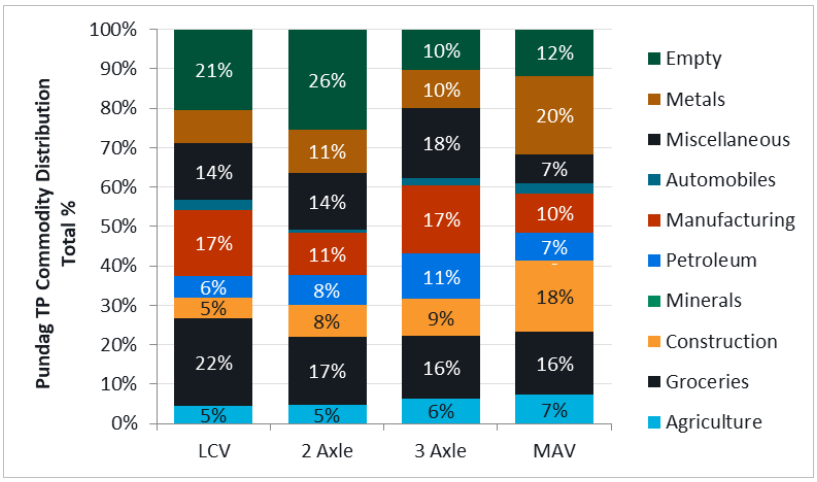
Source: Steer analysis

3.31 As observed during our site visit, a proportion of the vehicles were travelling empty. Those not empty, were carrying manufactured goods and related commodities (10-19%) across all goods vehicles.

3.32 For MAVs, metals and related commodities were observed with the highest share of 23%. Steel plants at Bokaro and Jamshedpur can be the main reason behind high shares. As the vehicle size decreases, the proportion of metal commodities being transported also decreases.

3.33 Agriculture, groceries and related commodities dominated the LCV category. Agricultural and groceries made up 27% of the LCVs. LCVs also carry 17% manufacturing goods. The share of agriculture and grocery decreases slightly for 2A, 3A and MAV but hovers between 22-23%. 8% of 2A trucks, 11% of 3A trucks, and 7% of the MAVs are also observed to transport petroleum products.

Figure 3.7: Commodity distribution at TP1 Pundag



Source: Steer analysis of OD data

Trip length analysis

3.34 Trip-length distribution provides the distance-based profile of various vehicle types. This aids in validating assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-100 km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[11]

3.35 As observed in the Internal-External analysis, trips at the toll plaza are largely influenced by both internal or local zones and external zones. The same is validated by Figure 3.8, as the share of local and short-distance trips (up to 250 km) is considerably high in all the categories, ranging from 43% for MAVs to 53% for LCVs.

3.36 Medium-distanced trips gain greater share as the vehicles grow heavier from 8% in LCVs to 19% in MAVs. In terms of long-distance and very-long-distance trips (greater than 500 km), MAVs show a much higher share, up to 18% for 500-1000 km and 18% for >1000 km trips. These vehicles are travelling largely between East and North India.

3.37 We have seen in Figure 3.5 how the Asset serves to connect these two parts of the country; the trip length analysis also validates this assertion by showing such distribution. It is to be noted that for the category MAV, the proportions of E-E trips in Internal – External Analysis, East-Northeast and North India influence in Zonal Analysis, and >1000 km trips in the Trip Length Analysis are very similar, ranging around ~18%.

Figure 3.8: Trip length distribution at TP1 Pundag

[11] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: https://developers.google.com/maps/documentation/distance-matrix/start. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Average trip length	466	430	471	563

Source: Steer analysis of OD data

Conclusions

3.38 In summary, as per the traffic volume data, CJVs contribute to the highest share in traffic around 67% followed by MAVs with 16% share. Even though CJVs make up for the highest share in traffic, MAVs are the biggest revenue contributor.

3.39 Both, CJV and MAV category vehicles, predominantly buy single tickets. However, with the onset of strict FASTag implementation, the share of single journeys has reduced across the categories as the share of return journey tickets increased especially in CJV's. For MAVs Single, tickets have remained dominant, holding a share of close to 90% across the months at the plaza.

3.40 The TVC data shows minor variation on the TMS data, where at a total level, TMS was found to be 0.4% lower than TVC count for the same period. This gives us confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

3.41 The OD analysis indicates that in terms of zonal influence, the Asset has high share of traffic originating/ending at IAOI areas and hence, the Asset serves largely local traffic, more so for CJVs: Local and IAOI zonal influence ranges from 57% for MAVs to 79% for CJVs. The key commodities transported on the Asset include minerals, groceries, and manufactured products, which when combined, make up around 54% of the commodity share for MAV traffic. Agricultural and groceries also contribute an average 22-27% share across all goods vehicle's categories.

3.42 When considering the internal and external distribution, it is observed that healthy mix of internal and external traffic is observed. I-I and I-E trips dominate for 3A and MAV categories suggesting Jharkhand as a significant origin of truck traffic. Since, majority of the traffic is attributed to Internal zones, it can be inferred that the traffic is greatly local in nature, and the growth of traffic is directly proportional to the growth of state. In terms of through traffic, 12% of MAVs have both ends of trip external to the Asset, in terms of trip length analysis this makes up for 18% of trips traveling >1000 km.

3.43 In summary, analysing the vehicle share on the Asset and understanding the OD analysis, CJVs are the dominant vehicle class and as found by the zonal influence, internal-external and trip length analysis and are greatly contributing to the local traffic. Heavy goods vehicles, although accounting for 16% of the traffic, are the largest revenue generator for the Asset.

4 Socio economic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the roads are in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions in the region where the Asset is located and the country. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Asset.

4.2 In turn, the change in the relative competitive position of the Asset (and thus of the traffic capture they can achieve) derives from how the relative offer for the roads changes, i.e. the service offered, and the tolls charged on the project roads, in comparison to that on competing roads; and whether any competing road facilities are planned.

4.3 In this chapter, we have assessed the trends of the above growth drivers, as indicators of the socio-economic conditions in the regions surrounding the Asset.

Population Growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in Jharkhand state, where the Asset is located.

National level

4.5 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of Population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State level

4.6 Table 4.2 below shows the evolution of population in Jharkhand state compared to that of the country. Overall, as can be seen, the trend observed at the country level is also noticeable at the state level, namely, a move towards urban agglomeration with the growth in rural population being slower than that of urban population. Further, the state has grown at a higher rate than the country average, in the decade between 2001 and 2011.

Table 4.2: Population Growth in India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Jharkhand	33.3	39.7	1.5%
India	1,210	1,395	1.2%

Source: Ministry of Statistics and Program Implementation estimates

4.7 Due to the complexities of the patterns in which urbanisation takes place, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide a socio-economic context of the trend in the region in which the Asset is located.

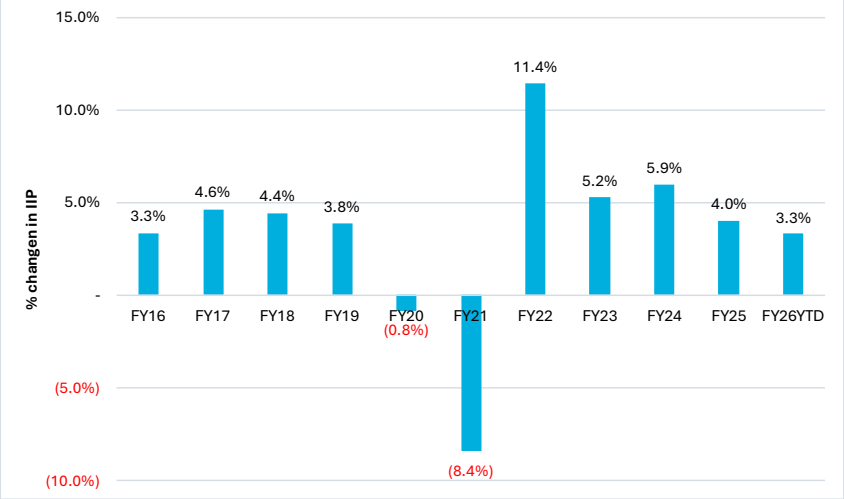
Economic Indicators

Industrial Production

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 The figure below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4%, and FY26YTD (till February 2026) recording 3.3% growth over FY25.

Figure 4-1: Annual growth – Index of Industrial Production (FY16-FY26YTD)



Source: Ministry of Statistics and Program Implementation (MoSPI). FY26YTD represents data till Feb'26

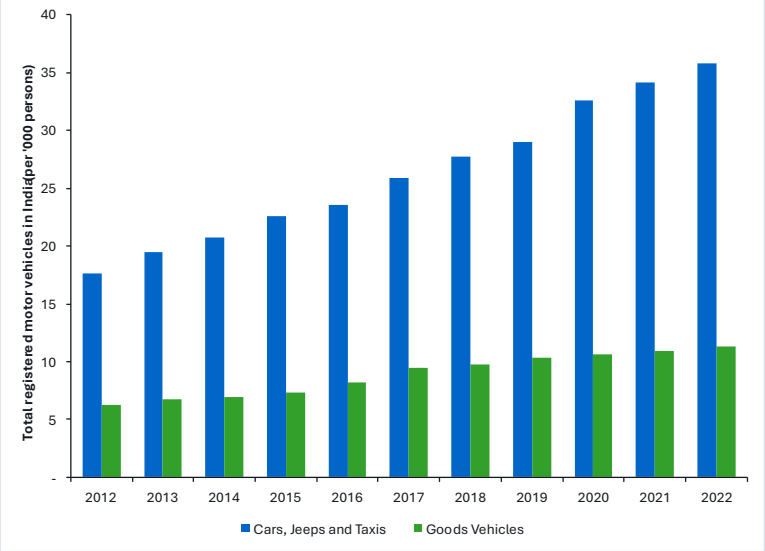
4.10 Since state-level IIP data is not as readily available as national-level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MoSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle ownership

4.11 The gap in car ownership between India and developed nations remains substantial – with 36 cars/jeeps/taxis and 11 commercial vehicles per thousand people, as of FY22 (the latest year for which official data is available). However, with increasing per capita income levels, a booming economy and the subsequent increase in demand for mobility, the number of registered vehicles has been on a gradual upward trend

A.1 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. Between FY12 and FY22, the CAGR for CJV and goods' vehicles registered in India was 8.6% and 7.3% respectively

Figure 4-2: Total number of registered motor vehicles in India (per 1000 population

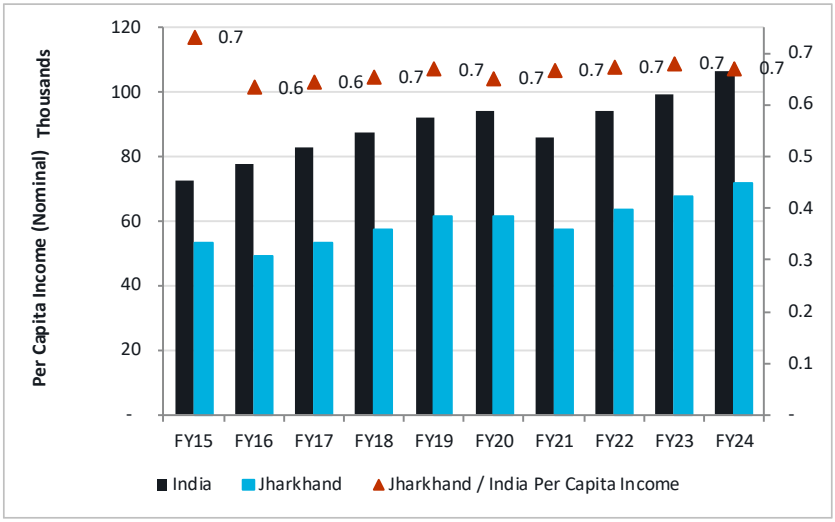


Source: Ministry of Road Transport and Highways (MoRTH)

Per Capita Income (PCI)

4.12 The state of Jharkhand where the Asset lies has a per capita income significantly lower than that of India as a whole. It has been hovering at nearly 67% of the national average for the past few years (FY22-24). Thus, the state is at a very early stage of consumption curve. Going forward, we therefore expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

Figure 4.3: Per Capita Income



Source: Steer analysis of MoSPI data

4.13 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, the long-term forecast for PCI is not available we therefore refrain from using it to forecast traffic.

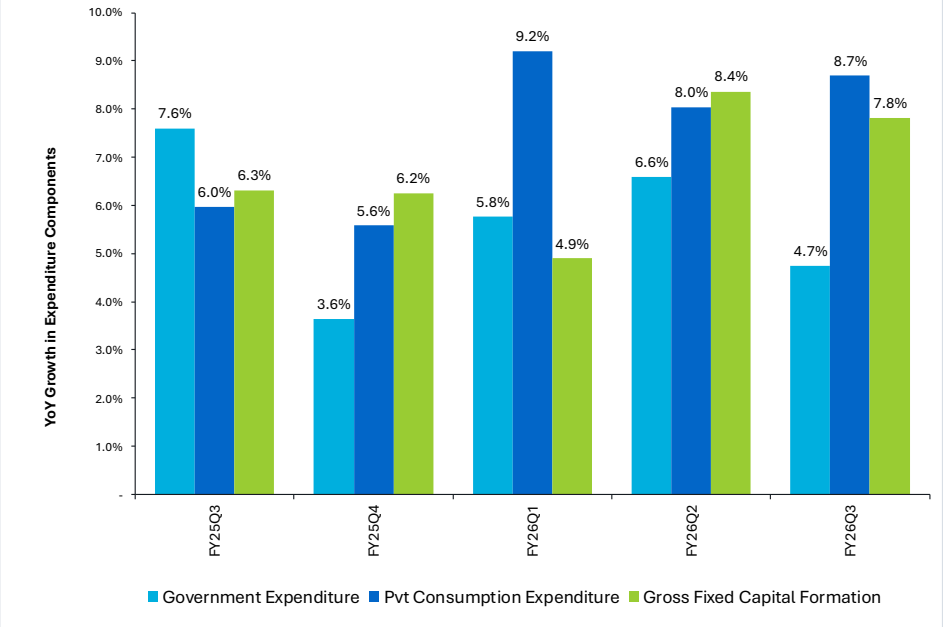
Economic growth

India's Performance

4.14 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q3 GDP at 7.8% over FY25Q3. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[12].

4.15 The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past year (FY25Q3-FY26Q3).

Figure 4-4: YoY growth in expenditure components of GDP



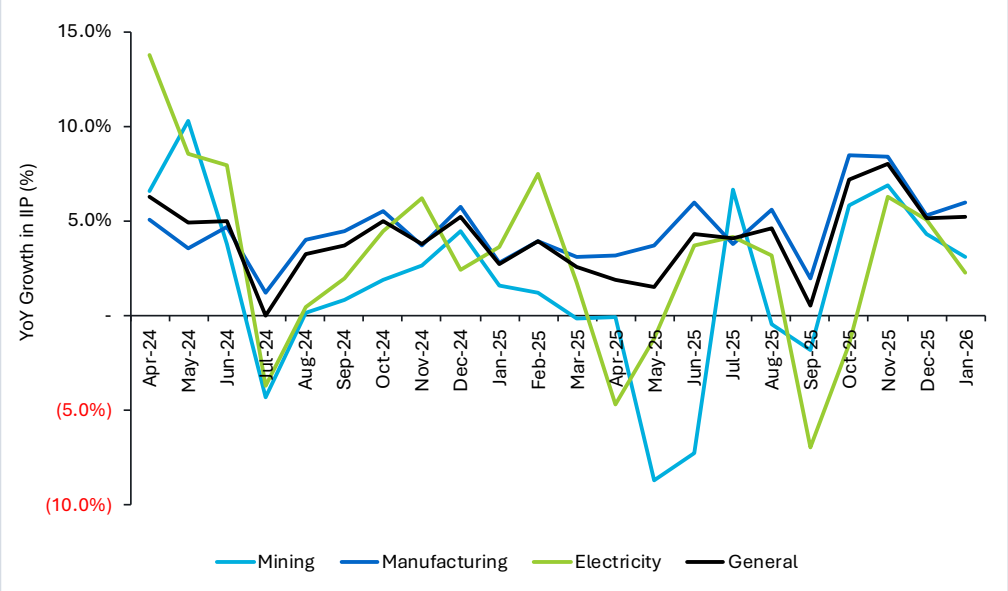
Source: Steer Analysis of MOSPI Data

4.16 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 5.8% growth over FY25Q1 levels.

4.17 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr'25-Feb '26), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

[12] Gov**ernment of India PIB Release (27th February 2026)**

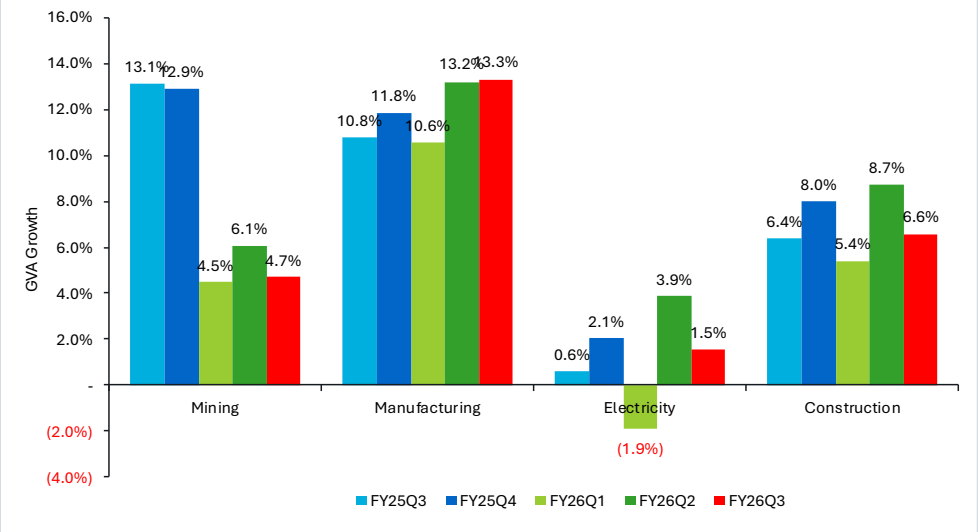
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.18 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

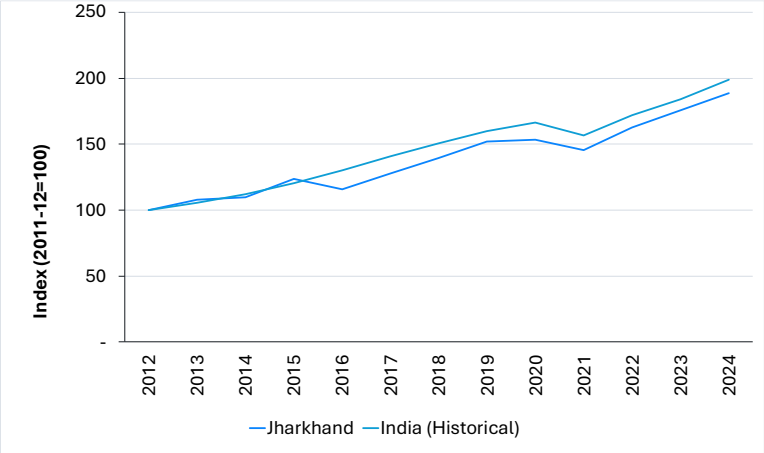
GDP and GSDP Growth

4.19 Over the period FY12-FY24, the Indian economy grew at a CAGR of approximately 6% aided by growth in the tertiary sector which grew at a CAGR of 6.9% over the same period

4.20 The Asset lies in the state of Jharkhand. Jharkhand is one of the richest mineral zones in the country with a share of around 40% of India's mineral resources and occupies the first position in the presence of coal reserves.[13] Due to its large mineral reserves, mining and mineral extraction are the major industries driving the state economy. The state houses the country's oldest and one of the largest steel plants, operated by the Tata Steel, in Jamshedpur. Another important steel plant at Bokaro, operated by Steel Authority of India Limited (SAIL) is also present in the state of Jharkhand. Since Jharkhand's economy is largely dependent upon the mining, the state GSDP growth rate fell rapidly after growing by over 10% in FY15 to -6% in FY16, with the ban on illegal mining. Jharkhand's GSDP (at constant prices) grew at a CAGR of 5.4% between FY12-24 and contributed 1.6% to India's GDP in FY24.

4.21 Figure 4.7 below illustrates the evolution of the GSDP of Jharkhand with the national GDP between FY12-24.

Figure 4.7: Evolution of Jharkhand's GSDP and the National GDP



Source: Steer Analysis of MOSPI data

4.22 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI). The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[14], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP and develop GSDP forecasts as a function of our assumed GDP forecasts[15].

4.23 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

[13] **Minerals | Government of Jharkhand State**

[14] **Consensus Economics - Economic Forecasts and Indicators**

[15] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

Forecasts for growth drivers

4.24 Following the discussion in Chapter 4 on the nature of economic activity in the state of Jharkhand, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.25 We have based our forecasts of the GSDP of Jharkhand based on the forecasts of GDP as provided by the Client.

National GDP

4.26 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[16]

4.27 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24.

4.28 Figure 4.8 below shows Client-provided GDP projections for India. The forecast provided expects the Indian GDP to grow at 6.4% between FY27-FY28 and gradually tapering down to 5.2% by FY50. The India GDP forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[17] in the short term Going forward, the forecast provided expects the Indian GDP to grow at an average of 6.5% between FY25-FY27, 5.9% between FY31-FY40 and gradually tapering down to 4.9% by FY51, end of concession.

4.29 Since Jharkhand is largely a mineral and manufacturing (iron & steel) dependent economy, the state is largely impacted by the fluctuations in these sectors. During the last decade, the mining industry was badly impacted by bans, new mining policy and change in steel and iron market scenario due to overall economic fluctuations. However, going forward, we expect as Jharkhand grows its economy stabilises overtime with magnitude of these cycles coming down.

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this section, we present our approach, assumptions, and estimates for base year AADT and background traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 While comprehensive historical data on the asset is not available, we have access to six years of records. Despite some inconsistencies, this dataset provides a reasonable foundation for analysis. As a result, statistical methods to estimate background growth relationships could not be applied. Instead, we conducted a benchmarking exercise, supported by trip length and origin-destination (OD) analysis, to derive elasticity estimates. These are discussed in detail below.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3; to establish the base year (FY26) traffic position, we utilized information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

The base traffic for FY26 has been estimated using 11 months of actual traffic data (April to February). Each toll plaza's seasonality correction factors were applied on the actual MADTs of Apr-25 to Feb-26 to obtain seasonally corrected estimates for FY26 traffic. An average of these estimates was considered to be the FY26 base traffic.

Seasonal Correction Factors

5.6 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season

followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.7 To normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.8 Historical traffic data was available for all toll vehicle categories starting October 2020 up-to February 2026. Therefore, in absence of longer-term historical data for the Asset where FY21 and FY22 are COVID-19 impacted years, we assume FY24 and FY25 to be the normal year which is considered for FY26 base year estimation.

5.9 Table 5.1 presents the FY24 and FY25 average SCF used to estimate the AADT for the Asset's Toll Plaza:

Table 5.1: SCF Values for TP1 Pundag

Vehicle Category	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	1.04	1.02	0.97	1.08	1.12	1.13	1.08	0.96	0.92	0.98	0.88	0.95
LCV	0.85	1.30	0.96	1.05	1.09	1.07	1.03	1.04	0.93	0.96	1.09	0.92
Bus	1.09	1.10	1.03	1.04	1.15	1.07	1.01	0.92	0.90	1.02	0.89	0.89
2A	1.06	0.98	1.04	1.04	1.02	1.01	1.03	1.09	1.04	1.08	0.87	0.90
3A	1.01	1.01	1.02	1.05	1.14	1.11	1.02	1.00	0.94	0.97	0.89	0.93
MAV	1.08	1.09	1.07	1.10	1.09	1.07	1.04	0.99	0.92	0.92	0.88	0.90

Adopted base estimates

5.10 Based on the above methodology and inputs, the adopted base for the Asset has been shown below:

Table 5.2: Adopted base estimates: TP1 Pundag

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	10,928	12,354	12,494	14.3%
LCV	363	384	397	9.5%
Bus	797	914	933	17.1%
2A	1,023	1,055	1,079	5.5%
3A	555	574	580	4.5%
MAV	2,557	2,860	2,906	13.7%
OSV	2	2	2	
Total	**16,224**	**18,144**	**18,392**	**13.4%**
PCUs	**28,245**	**31,301**	**31,781**	**12.7%**

Source: Steer analysis: FY25 actual full year, FY26YTD includes 11 months of FY26, FY26A is adopted base for FY26.

5.11 As seen from Table 5.2, there is estimated to be a 12.8% PCU growth in the adopted FY26 base (FY26A) over FY25. All vehicle categories showcase healthy growth over FY25.

5.12 In the case of LCV and Bus we observe a change in the categorization of minibuses. Prior to FY25 the classification was based on "Gross Vehicle Weight" which has been changed to passenger-based system resulting in tolling of minibuses into the bus category.

5.13 The continued high growth in both PCU and across vehicle categories is driven by temporary traffic shift to the Asset post Jun'23 with the construction on Ormanjhi-Gola-Bokaro section of NH 320B. However, we believe this shift is temporary and not a part of the Asset's traffic hence, necessary adjustments in forecast and segmentation are made as reflected later in this report.

Estimation of background elasticities

Overview

5.14 For brownfield Asset, where sufficient historical traffic evolution is available, it is common practice to use regression model analysis to determine the relationship, expressed as elasticity, between traffic growth and key socioeconomic drivers. This relationship is then applied to assumptions of future socio-economic evolution to estimate future traffic growth.

5.15 As for the Asset under consideration, a consistent historical trend was not available. Therefore, we undertook a benchmark to estimate our forecast elasticities, Sources used included our understanding of the Asset, the elasticities used during the bid for TOT3 package by the client and the subsequent lender study that was undertaken by the Client. We have also undertaken a regional benchmarking against Asset having similar traffic profiles, which give us reasonable confidence the relationships proposed.

5.16 In terms of selection of growth drivers for vehicle types, in general we have assumed state GDP as the key driving factor for the passenger traffic given this traffic is generally driven by the local economies of the cities and state containing the Asset. The heavier commercial vehicles generally ply long-distance, and the underlying growth is governed by the general economies of several states or nation as whole.

5.17 The below table presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.3: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP Jharkhand
Car		100%
LCV		100%
Bus		100%
2A	100%	
3A	100%	
MAV	100%	

Source: Steer

5.18 Further to developing estimates for FY25 AADT, the Asset has operational history between FY22 and FY25, proving us four years of traffic growth on the Asset. The table below

summarises the volume growth across each of the vehicle categories. For this comparison we have normalised the FY22 AADT for COVID19 by adopting seasonally corrected H2FY22 as the FY22 normalised (FY22N), as can be seen in Table 5.4 below

Table 5.4: Passenger and Commercial growth with normalised FY22

	FY22N	FY23	FY24	FY25	FY26A	FY22N-26 CAGR
CJV	9,618	8,935	9,849	10,928	12,494	6.8%
LCV	511	445	487	363	397	(6.1%)
Bus	570	583	592	797	933	13.1%
2A	629	681	843	1,023	1,079	14.5%
3A	460	480	527	555	580	6.0%
MAV	1,639	1,690	1,945	2,557	2,906	15.4%
OSV	1	2	2	2	2	
Total	**13,427**	**12,814**	**14,245**	**16,225**	**18,392**	**8.2%**
PCUs	**21,516**	**21,178**	**23,773**	**28,201**	**31,781**	**10.2%**
Passenger	10,187	9,518	10,441	11,725	13,427	7.1%
Commercial	2,728	2,850	3,315	4,135	4,565	13.7%

Source: Steer Analysis; Note; Passenger includes CJV and Bus traffic whereas Commercial includes 2A/3A/MAV traffic

5.19 The Asset observed a CAGR of 10% from FY22N to FY26 at the PCU level, whereas commercial and passenger grew at a CAGR of 13.7% and 7.1% respectively. Passenger traffic, which includes CJV and buses, is projected based on the state's GSDP, as the growth is driven by the regional local economy. Meanwhile, commercial traffic (2A/3A/MAV) is growing in relation to GDP, as the Asset lies on the NH20 corridor, which primarily facilitates north-south movement between Bihar and southern West Bengal and south. Any growth observed on the Asset is influenced by regions along this route.

5.20 The sections below detail out the reasoning for selection of respective growth driver(s) for each vehicle category.

5.21 It must be understood that, in recent historical traffic performance across national highway corridors, a notable trend has emerged: there is a discernible shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets FY24 and FY25 performance as well. Consequent of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

Table 5.5: Elasticity Recommendations for the Asset

Vehicle Category	Proposed	Growth Driver	Comments
CJV	1.0	Jharkhand GSDP	The cars predominantly commute between Ranchi, Ramgarh, Hazaribagh and other local destinations along the Asset. With the increase in urbanisation and trip generators along the Asset, cars are expected to grow

Vehicle Category	Proposed	Growth Driver	Comments
			faster in the near future, therefore we have assumed a 1 relationship to GSDP for cars.
Mini LCV	0.6	Jharkhand GSDP	As discussed in chapter 3, the trip lengths for Mini LCV and LCV category (up to 70%) are predominantly short distance <300Km and caters to local demand. Hence, elasticity of 0.6 is assumed which is higher than LCV's.
Buses	0.5	Jharkhand GSDP	Buses are local and interstate, around 85% of the buses have one end of their trip in Jharkhand, while 10% of trip have one end of their trip in Bihar. It seems that buses currently are serving local intercity demand. As these cities grow, the buses are also expected to respond to the increasing demand however only at a 0.5 relationship to GSDP.
LCV	0.4	Jharkhand GSDP	As discussed in chapter 3, the trip lengths of LCV and 2A category (up to 70%) are predominantly short distance <300Km. Which confirms the understanding that the movements cater to local demand. Considering the above observations, and our experience across other toll roads in the region, we believe that elasticities of 0.4 and 0.7 with respect to state GSDP and GDP for LCV and 2As resp. are considered reasonable.
2A	0.7	GDP India	
3A	0.2	GDP India	The Asset observes traffic between Haryana, Rajasthan, Jamshedpur, as well as the Bokaro Steel Plant. 55% of all MAVs cover >300 Kms, and ~30% cover >1000 Kms journeys. The long-distance character, in addition to the proximity of steel plants catering to nation-wide demand shape the critical link between the Asset and the national economy. We assume this relationship to influence a healthy growth profile for traffic on the Asset in the future as well.
MAV	0.9	GDP India

6 Forecasts: Network overlays and forecasts

Introduction

6.1 Following the discussion on our forecast of background growth rates in the previous chapter, this chapter first covers the potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in earlier Chapters, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

Construction of NH320B

6.3 The alternate route NH320 for Dhanbad-Bokaro-Ranchi trips, passing via Ormanjhi and Gola is the traditional route used for Ranchi-Bokaro trips. This is a two laned road. However, a section of this route called Mihir Ghati is undergoing 4-laning and is expected to be a part of the four-lane greenfield NH320B road that runs parallel to the existing NH320. Due to the ongoing four-laning of the Mihir Ghati, commercial traffic is forced to use Pundag toll plaza for trips between Ranchi and Bokaro. Construction is expected get completed by the second half of FY27. This diverted traffic is expected to return to the alternate road when the construction activity is completed as seamless connectivity would be established between Ranchi and Bokaro.

6.4 Basis the site visit observations and secondary research, the construction of Gola – Oramanjhi stretch is expected to be completed by the second half of FY27. Given this impact we expect a large share of the additional traffic to shift back to NH320B starting FY27, with full impact realising by FY29.

6.5 The following table shows the extent of the impact of the opening of NH320B.

Table 6.1: Impact of opening of NH320B

Vehicle category	FY27	FY28	FY29 onwards
Staging	*40%*	*80%*	*100%*

Vehicle category	FY27	FY28	FY29 onwards
CJV	(5.0%)	(10.0%)	(12.5%)
Bus	(9.1%)	(18.1%)	(22.7%)
LCV	(8.8%)	(17.6%)	(22.0%)
2A	(9.1%)	(18.1%)	(22.7%)
3A	(9.7%)	(19.4%)	(24.3%)
MAV	(9.3%)	(18.6%)	(23.2%)

Source: Steer analysis

Varanasi Kolkata Expressway

6.6 The NHAI is currently building a greenfield 4/6 lane access-controlled expressway between Varanasi and Kolkata with a spur to Kharagpur. So far 13 packages for the Asset in states of Uttar Pradesh, Bihar and Jharkhand have been awarded. The above-mentioned packages were awarded in March 2023. The expressway section in Jharkhand covers 203km across four districts, costing around Rs 10,000 crore. Designed for speeds of 120 km/hour, it includes measures like wildlife underpasses and interchanges. This expressway will intersect with the Asset at Bongabar, north of Ramgarh. It is expected to have some impact on the Asset once complete, as it can act as a feeder route providing access to Ranchi and Hazaribagh from the west and east respectively. Its impact is illustrated in the below table.

Figure 6.1: NH320 and Varanasi Kolkata Expressway

2A	0.3%	0.8%	1.0%
MAV	0.3%	0.8%	1.0%

Source: Steer analysis

6 laning LOS improvement

6.7 As per the concession agreement as soon as the Asset hits 40,000 PCU's the Asset is eligible for capacity augmentation. The PCU level need to be maintained above the 40,000 levels for three consecutive years, and two years will be earmarked for DPR preparation. After that a three-year period is factored in for construction, during which the Year one of construction toll rates will be maintained at 75% and will remain flat at 75% for the duration of construction. After the construction is over the toll rates will be calculated as normal, as they should have been in that year.

6.8 On the Asset, it is expected based on our forecasts that traffic volumes will go beyond the 40,000 PCUs mark in FY35, thus breaching the Level of Service requirements set out in the concession agreement. We expect the level of service on the Asset to improve post capacity augmentation by FY43. To calculate this impact, we have employed a GJC based approach.

6.9 A comparison of generalised journey costs (GJC) provides how different elements of cost and time affect traffic. This comparison was done for both light and heavy vehicles. Lower GJCs correspond to higher induced traffic. Based on Steer's studies and research in India, we have found that for every 1% reduction in the GJCs, the traffic increases by a factor of 0.3. We then applied the difference of GJCs to the elasticity of 0.3 to get net influence on the traffic.

6.10 The improvement in GJC is translated into the impact on that share of local + IAOI OD movements using a linear inverse relationship. Therefore, the impact of improvement in level of service is applied on the corresponding shares of traffic, which were extracted from OD data.

6.11 The table below shows the extent of the LOS impact and the expected timelines of the impact on the Asset.

Table 6.3: Impact of 6 laning LOS improvement

Vehicle category	FY43 onwards
CJV	2.0%
LCV	1.6%
2A	1.8%
3A	1.6%
MAV	1.2%

Source: Steer analysis

Revenue forecasting assumptions

6.12 To forecast the revenues for a particular financial year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e., traffic (trips) to tickets sold, "toll segmentation" provides the latter i.e., the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Toll segmentation

6.13 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles.[18]

6.14 Across multiple assets, the share of annual pass trips has been rising on a monthly basis since August 5. A corresponding decline in other ticket categories including Single and Return journeys has been observed.

6.15 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and post-annual pass segmentation from 15th August 2025 till 28th February 2026. The share of annual pass trips in March 2026 has been assumed to be the same as the share of annual pass trips in the last 10 days of February 2026.

The segmentation for CJVs in FY27 has been assumed to be the same as the estimated March 2026 segmentation as trends suggest that the share of annual pass trips have stabilised. For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Feb) as discussed in the earlier sections, can be considered a normal period.

Table 6.4: Toll segmentation for FY26 onwards

Ticket type	CJV FY26	CJV FY27	Mini LCV	LCV	Bus	2A	3A	MAV
Single	26%	23%	29%	45%	9%	64%	66%	83%
Return	47%	41%	53%	50%	90%	34%	31%	17%
Monthly	-	-	-	-	-	-	-	-
Local commercial	2%	2%	2%	4%	1%	0%	2%	0%
Local personal	6%	4%	6%	-	-	-	-	-
Exemption	9%	9%	10%	1%	1%	2%	1%	0%
Violation	0%	0%	0%	0%	0%	0%	0%	0%
Annual Pass	10%	21%	-	-	-	-	-	-

Source: Steer analysis of Client TMS data; ticket segmentation for all vehicle categories other than CJVs are from FY26 onwards

[18] Annual Pass

6.16 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.5 presents the Annual pass compensation computed for the toll plaza.

Table 6.5: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY28	FY33	FY38	FY43	FY51
Pundag	4.3	9.7	14.8	27.4	46.4	101.0

Source: Steer Analysis

Trip factors

6.17 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY26YTD data available and listed in the table below:

Table 6.6: Trip factors at TP1 Pundag

Forecast	CJV/ Mini LCV	LCV	Bus	2A	3A	MAV
Single	1	1	1	1	1	1
Return	2	2	2	2	2	2
Monthly	14	46	50	50	45	45
Local commercial	1	1	1	1	1	1
Local Personal	20	20	20	20	20	20

Source: Steer analysis of Client TMS data

Toll evolution

6.18 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.19 We have used actual toll rates from the FY26 toll notifications and FY26 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in the table below. These forecasts provided by the Client expect the Indian WPI to grow at an average of 4.0% between FY25-FY51. The Dec-25 WPI released by RBI, based on which FY27 tolls are calculated, is 0.96%. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client.

Table 6.7: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	0.96%
FY28	5.0%
FY29	5.1%

Financial year	WPI growth (%)
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: Client inputs used for WPI FY27 onwards.

Revenue reconciliation

6.20 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a daily level for the Asset. To reconcile we have used the FY26YTD segmentation, FY26YTD AADT and compared it with the reported revenue for the year. The exercise was undertaken at an annual level. The comparison, as shown in the table below, depicts the modelled revenue and the reported revenue and the difference between the two is 0.1%, this validates the assumptions around segmentation and trip factors used for estimating forecasting revenue.

Table 6.8: FY26 Revenue Reconciliation AADC (INR lakhs/daily)

Modelled	Reported	Delta
39.3	39.3	(0.1%)

Source: Steer comparison between modelled and reported revenue

Traffic and Revenue forecasts

6.21 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the forecast period for the Asset. The table below presents the AADT/PCU and revenue forecast growth rates and CAGRs on this Asset. Further, Appendix B presents the AADT and revenues for the forecast period.

Table 6.9: Final traffic forecast for TP1 Pundag

Vehicle Type	FY26	FY28	FY33	FY38	FY43	FY51
CJV	10,984	11,135	14,801	19,965	27,107	41,025

Source: Steer analysis

6.22 As presented in the tables above, traffic CAGRs (PCUs) for the traffic forecast (with impacts) on the Asset over the concession period is around 5% and corresponding revenue CAGR is around 8%. This growth is majorly driven by both CJVs and MAVs, as discussed in the historical section, this Asset connects major urban settlements of Hazaribagh, Ramgarh and Ranchi and because of which CJVs on the Asset are expected to grow with increasing per capita income levels of the region and are expected to grow at

a healthy rate for a longer period, given the low car ownership levels in the state. While for the strong growth of the MAVs can be attributed to the growing industrial landscape in the vicinity of the Asset which includes steel plants, power plants and mining activities.

Target revenues and modification of concession period

6.23 As per the concession agreement, the target revenue should be 15.80 Cr for the month of March 2030 first calculation of target revenue and 38.02 Cr for the month of March 2040 for the second calculation of target revenue. The traffic sampling will be undertaken for a continuous period of 7 days during anytime within 15 days prior to the date on the specified year, previous year and following year. The average thereof will be deemed as 'actual revenue.'

6.24 If the target revenue falls short or exceeds by 20% and 30% for extensions 1 and 2 respectively, the concession period shall be deemed to be modified using the laid-out conditions in the concession agreement. The table below presents the summary of the analysis.

Table 6.13: Target Revenues for Extension 1

Target Month	Target Revenue		Estimated Revenue		Average Revenue	Variation (%)
	INR Cr	2029	2030	2031		
Mar-30	15.80	15.38	16.97	18.71	17.02	7.7%

Source: Steer analysis

Table 6.14: Target Revenues for Extension 2

Target Month	Target Revenue		Estimated Revenue		Average Revenue	Variation (%)
	INR Cr	2039	2040	2041		
Mar-40	38.02	29.94	31.44	33.00	31.46	(17.3%)

Source: Steer analysis

6.25 We have used the average AADT forecast for target year, previous year and following year as a proxy for 'actual traffic.' We have forecast seasonality of March month to adjust for seasonal trends and arrive at March traffic from AADT traffic, which is then segmented according to the forecast toll segmentation and trip factors and multiplied with respective estimated toll rates to get to a monthly revenue collection.

6.26 As seen from the table above, the difference lies within the 20% and 30% thresholds, no modification of concession period is expected on the Asset.

Upside and Downside cases

Upside and Downside scenario assumptions

6.27 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both

positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.28 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.29 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.15: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.30 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.31 The upside case impacts included in forecasts are summarised in below.

Table 6.16: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact
6 laning LOS improvement	FY43- 100%	+25% of base case	CJV: 2.5% LCV: 2.1% 2A: 2.2% 3A: 2.0% MAV: 1.5%
Four laning of NH320	FY27* - 40% FY28 – 80% FY29 – 100%		CJV: (9.4%) LCV: (16.5%) Bus: (17.0%) 2A: (17.0%) 3A: (18.2%) MAV: (17.4%)
Varanasi Kolkata Expressway	FY28* - 25% FY29 – 75% FY30 – Full Impact		CJV: 1.25% 2A: 1.25% MAV: 1.25%

Source: Steer analysis; * Same as base case timeline

Impacts-Downside Case

6.32 The downside case impacts included in forecasts are summarised in below.

Table 6.17: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact
6 laning LOS improvement	FY43 – 100%	-25% of base case	CJV: 1.5% LCV: 1.2% 2A: 1.3% 3A: 1.2% MAV: 0.9%
Four laning of NH320	FY27* - 40% FY28 – 80% FY29 – 100%		CJV: (15.6%) LCV: (27.5%) Bus: (28.3%) 2A: (28.3%) 3A: (30.4%) MAV: (29.0%)
Varanasi Kolkata Expressway	FY28* - 25% FY29 – 75% FY30 – Full Impact		CJV: 0.75% 2A: 0.75% MAV: 0.75%

Source: Steer analysis; * Same as base case timeline

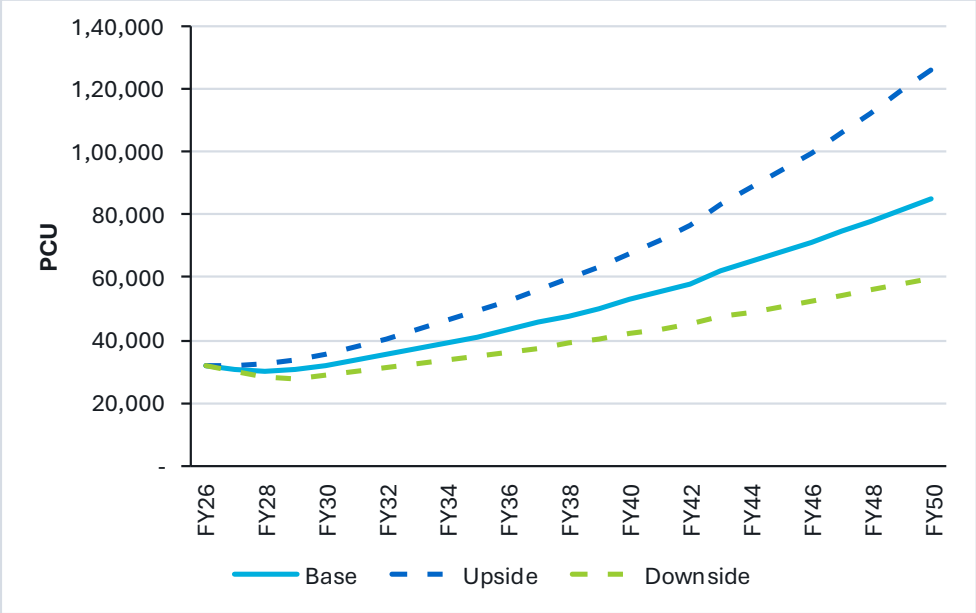
6.33 Based on the above assumptions for upside and downside scenarios, the following table summarizes the upside potential and downside risks associated with the PCU and the revenue for Pundag toll plaza at the end of the concession i.e. FY51.

Table 6.18: Upside potential and Downside PCU scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Pundag	50.1%	(30.9%)

Source: Steer Analysis of client data

Figure 6.2: Long-term PCU forecasts for Pundag TP including upside and downside scenarios



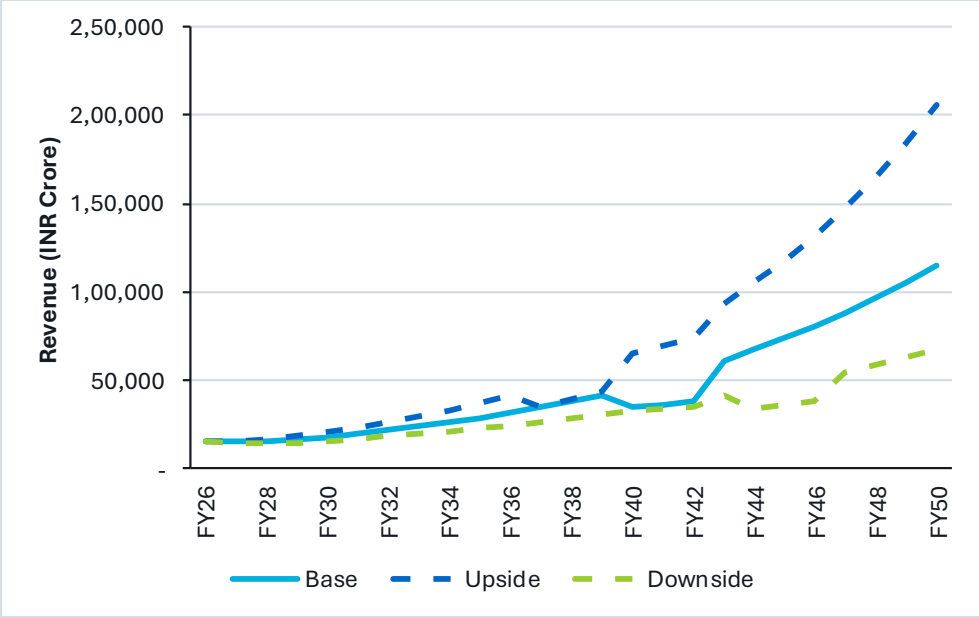
Source: Steer Analysis

Table 6.19: Upside potential and Downside Revenue scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Pundag	83.6%	(43.0%)

Source: Steer Analysis

Figure 6.3: Long-term revenue forecasts for Pundag TP including upside and downside scenarios



Source: Steer Analysis

6.34 Revenue projections exhibit variability in both the upside and downside cases, driven by fluctuations in macro-economic factors such as WPI, GDP/GSDP, elasticities and the network impacts.

Summary outlook

6.35 Passenger movement on the Asset is largely local in nature, connecting the cities of Ranchi to Patratu, Ramgarh, Hazaribagh over the short distance and northern regions of Delhi NCR, Uttar Pradesh, Patna, Gaya and Barhi to Jamshedpur, Rourkela, and further southern cities. Cars, the dominating vehicle category on the Asset, are expected to see a healthy growth on the Asset following the overall behavioural shift of users away from public transport.

6.36 Groceries, agricultural and manufacturing goods being transported form a part of essential commodities and are expected to show a healthy growth in the future years as well. Since the Asset is located in mineral and steel rich state of Jharkhand with numerous mines in the vicinity, the Asset is bound to grow with the growth of industrial sector as well as the overall growth of the country.

6.37 The strategic importance and geographic location of this Asset, connecting the key movement between north India and Bihar to the Jharkhand, Odisha, and West Bengal, is expected to continue driving a healthy traffic growth rate in the forecast years.

6.38 The MAV traffic on the Asset is largely influenced by the mineral industries along its alignment, which also contributes to the overall stability of MAV volumes across different time periods. Recent evidence from various industry players suggests a rebound in Steel production and consumption led by economic activity and urbanization which is expected to boost demand for steel in India to between 240-260 million metric tons by 2035. [19] [20] These factors support the growth prospects of the Steel related industry and traffic in the future. Beyond these natural growth factors, higher than usual growth was observed on Asset due to the work on the alternate NH320 as mentioned earlier.

6.39 Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by Client, feedback from Client meetings and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarised below.

6.40 Overall, we see a positive outlook for the region and the Asset, given that it serves major urban centres of Ranchi, Jamshedpur, Bokaro, Patna, Bhubaneswar, and Rourkela. The underlying growth drivers of the corridor are strong and are expected to deliver long term sustained growth driven by the industrial growth in the state backed by the potential of significant mining and mineral resources in the region.

Appendices

A. Top 10 OD Pairs

A.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. Please see this data for both CJVs and MAVs and OSVs combined below

TP1 Pundag

Table A.1: CJV top 10 OD pair shares at TP1 Pundag

	OD Pair	Share
1.	Ranchi-Ramgarh	9.8%
2.	Hazaribagh-Ranchi	9.3%
3.	Ranchi-Ramgarh	5.6%
4.	Hazaribagh-Ranchi	4.7%
5.	Ormanjhi-Ramgarh	3.6%
6.	Hazaribagh-Ranchi	3.1%
7.	Barhi-Ranchi	3.0%
8.	Hazaribagh-Khunti	2.8%
9.	Hazaribagh-Gumla	2.7%
10.	Ranchi-Patna	2.6%

Table A.2: MAV and OSV top 10 OD pair shares at TP1 Pundag

	OD Pair	Share
1.	Ranchi-Ramgarh	9.2%
2.	Ranchi-Patna	6.4%
3.	Ranchi-Bokaro	5.0%
4.	Hazaribagh-Ranchi	4.9%
5.	Ranchi-Dhanbad	4.2%
6.	Ranchi-Uttar Pradesh	2.1%
7.	Patna-Rourkela	2.1%
8.	Patna-Purbi Singhbhum	1.7%
9.	Ranchi-NCT of Delhi	1.7%
10.	Ramgarh-Purbi Singhbhum	1.4%

B. Data Collection Exercise

B.1 In order to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

7-day TVC Count

Table B.1: TVC counts at TP1

Date	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	Total
21-02-2026	10,914	1,559	1,669	997	999	687	3,533	20,378

C. Detailed Forecasts

C.1 Further to the summary of forecasts presented in Chapter 6, this appendix presents detailed forecasts.

Traffic forecasts

C.2 This section presents the detailed traffic forecasts for the forecast period until FY51, year of expected close of the concession. The following two tables show the traffic growth rates and AADT, respectively.

Table C.1: Traffic Forecast (with impacts) over horizon years at TP1 Pundag

Year	CJV	Mini LCV	Buses	LCV	2A	3A	MAV	AADT	PCUs
FY27	10,978	1,573	878	373	1,026	531	2,790	18,150	30,893
FY28	11,135	1,637	817	346	968	479	2,657	18,041	30,065

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken based on third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long-term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through February 2026. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate, or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

Glossary Items

Acronym	Meaning
2A/ Truck	2 Axle/ Truck
3A	3 Axle
AADT	Annual Average Daily Traffic
BOT	Build Operate Transfer
CAGR	Compound Annual Growth Rate
CJV	Cars / Jeeps / Vans
COD	Commercial Operations Date
DPR	Detailed Project Report
ETC	Electronic Toll Collection, also referred to as FASTag
FY	Financial Year
GDP	Gross Domestic Product
GSDP	Gross State Domestic Product
HAM	Hybrid Annuity Model
HCM/ EME	Heavy Commercial Vehicles/ Earth Moving Machinery
IE reports	Independent Engineers' reports
INR	Indian Rupees
km	Kilometre
LCV/ LGV	Light Commercial Vehicles/ Light Goods Vehicle
LMV	Light motor vehicles
MADT	Monthly average daily traffic
MAV	Multi Axle Vehicle
NH	National Highway
NHAI	National Highways Authority of India
NHIIMPL	National Highways Infra Investment Managers Private Limited
NSDP	National State Domestic Production
OD	Origin Destination
OSV	Oversized vehicles
PCU	Passenger Car Unit: it is a measure of standard vehicle unit to convert all vehicle classes to a single unit by using PCU factors to compute total traffic on an asset.
Q1	Quarter 1 of financial year, from April to June
Q2	Quarter 2 of financial year, from July to September
Q3	Quarter 3 of financial year, from October to December
Q4	Quarter 4 of financial year, from January to March
RNP	Registered Number Plate
SCF	Seasonality Correction Factor
SH	State Highway

Acronym	Meaning
T&R	Traffic and Revenue
TMS	Traffic Management System
TVC	Traffic Volume Count
WADT	Weekly average daily traffic
YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Jhansi Lalitpur Tollway Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 11 project". This report presents a full update of the traffic and revenue forecasts based on recent network developments, actual traffic data available up to February 2026 and latest macro-economic assumptions.

1.2 The Asset Jhansi-Lalitpur consists of two toll road sections, each of which has a special purpose vehicle (SPV). For this report, we hereafter call the two SPVs together as a single Asset and the toll plazas on each section as TP1-2.

- Jhansi Lalitpur Tollways Limited: JLTL-: TP1 – Babina
- Jhansi Vigakhet Tollways Limited: JVTL-: TP2 - Vigakhet

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1-1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• • Provided by client for the period between Oct'20 and Mar '26, with FY26 base AADT and forecasts considering data up to Feb'26
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip Length Distribution	• Origin Destination (OD) surveys undertaken by Steer. The surveys were undertaken in 2024 on TP1 and in 2026 at TP2.
• Analysis of upcoming network improvements and other	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by

Scope of work	Data source
developments, that may have future impacts on traffic	Steer based on Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI); and latest Wholesale Price Index (WPI) trends as shared by the client

Our Approach

1.4 Our analysis follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset.

1.5 The analysis has focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.6 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources as given below:

- Client-provided secondary data, including:
- TMS data starting October 2020 to February 2026. The historical traffic and revenue presented in Chapter 3 considers information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.
- Concession agreement and toll notifications for FY25 and FY26
- Previous studies related to traffic and revenue
- Steer-commissioned OD survey on 30th January to 31st January 2024 and TVC survey from 29th January to 31st January 2024 on TP1 Babina toll plaza as part of earlier commission. Similarly, as a part our current commission Steer-commissioned TVC counts on TP2 Vigakhet from 23rd February to 25th February 2026 and OD survey from 24th February to 25th February 2026.
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.7 The estimation of future traffic demand on the Asset was undertaken through:

- To determine the adopted FY26, seasonality correction factors (SCFs) were applied on the 11 months of data available in FY26 (Apr-Feb).
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of the concession. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.8 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analyses;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases

2 The Asset

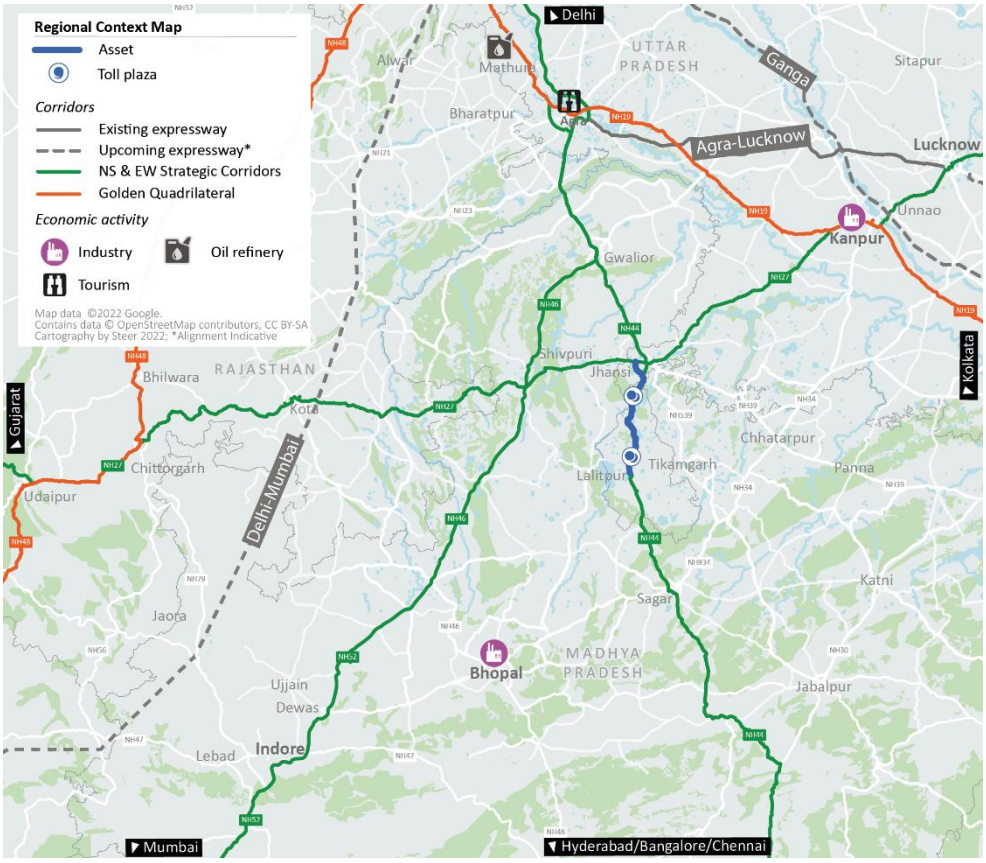
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is in the state of Uttar Pradesh, connecting Jhansi and Lalitpur, on the NH 44 (old NH 25 and 26). NH44 caters to the North- South movement between Jammu and Kashmir, and Kanyakumari, connecting major centres of economic activity such as Delhi, Nagpur, Hyderabad, Bangalore, and Chennai. The following figure shows the regional road network in which the Asset is located.

Figure 2-1: Location of Jhansi-Lalitpur and corresponding toll plazas



Source: Steer Cartography

2.3 The Asset primarily caters to two different types of strategic movements:

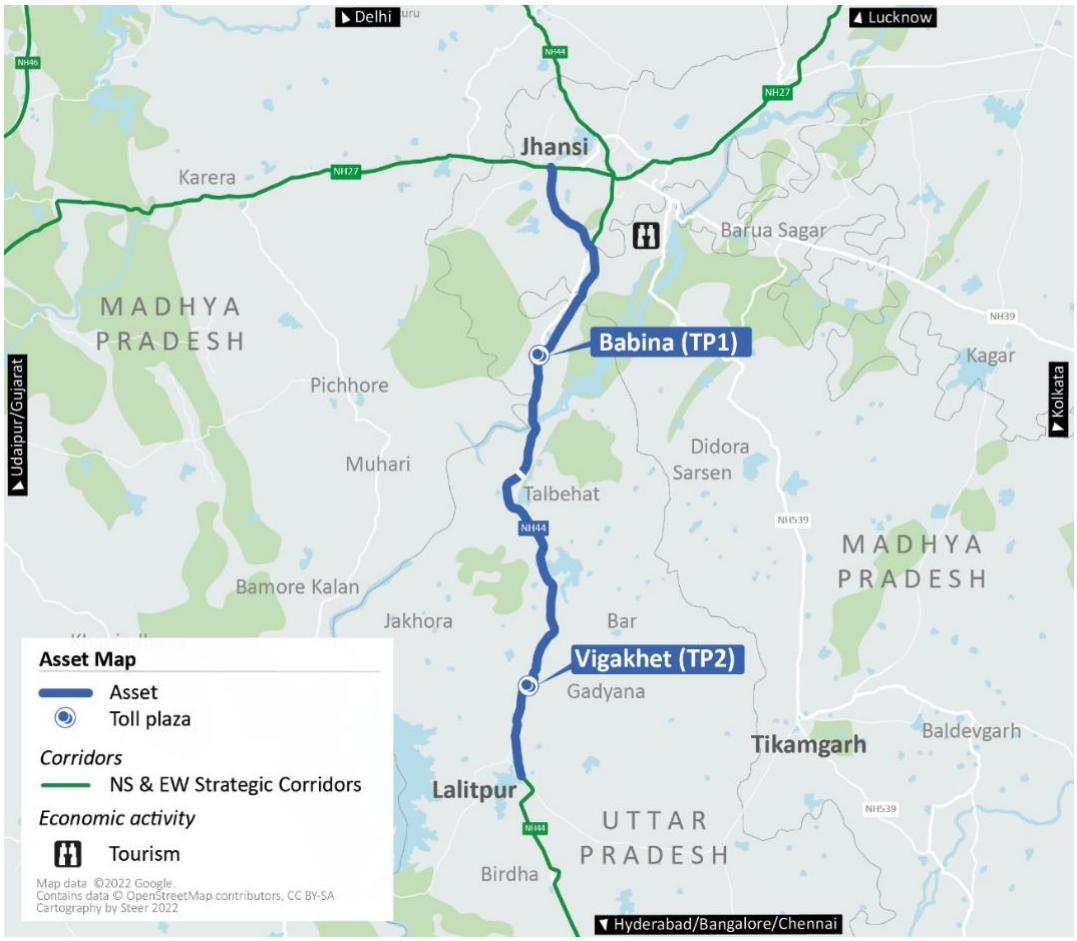
- **Short-distance trips** including leisure and business travel trips between some of the key tourist towns/cities around the Asset between Jhansi, Orchha, Talbehat, and Lalitpur.
- **Medium-distance and long-distance trips** by 3A and MAVs primarily between Delhi and north and Hyderabad/Bengaluru. The asset provides key link for the movement of goods between the states of Delhi, Haryana, Punjab in north India and Southern states of Telangana, Karnataka, Andhra Pradesh, and Tamil Nadu. Major long distance(>500kms) commodities include Automobile, Parcels, Manufacturing and Agri Commodities.

2.4 The Asset forms a 100.0 Km long contiguous section of toll roads which forms a part of NH 44 (old NH 25 and 26) in Uttar Pradesh. The following figure (Figure 2-2) provides a closer view of the Asset in the context of its immediate surrounding. Both the SPVs of the Asset are four-lane divided road with one toll plaza each namely,

- JLTL – TP1: Babina at km 32.100 and
- JVTL – TP2: Vigakhet at km 85.280.

2.5 TP1 Babina is near Jhansi whereas TP2 Vigakhet is near Lalitpur. The following figure provides a closer view of the Asset in the context of its immediate surroundings.

Figure 2-2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.6 TP1- Babina on the Asset has been operational since November 2014 whereas TP2-Vigakhet has been operational since March 2012. The Client took over the operations of the Asset in October 2020. There are still 25 years left in the concession period which ends in FY51. Table 2-1 presents a summary of the concession.

Table 2-1: Summary of concession

Particulars	Details
State	Uttar Pradesh
Highway and lane configuration	NH 44 (old NH 25 and 26), 4-lane divided
Toll plaza	• SPV 1: TP1: Babina • SPV 2: TP2: Vigakhet
Length (km) as per concession agreement, applicable	• TP1: 49.70 km • TP2: 49.31 km
Commencement of operations	• TP1: November 2014 • TP2: March 2012
Operated by Client since	20th October 2020
Concession period	30 years
Last year of concession	2051

Source: Client data

2.7 Following pictures show typical cross section of the Asset and toll plazas.

Figure 2-3: Typical cross-sections and toll plazas on the Asset

Source: Steer site visit

2.8 The toll rates for single category are shown in Table 2-2. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling. Like the other National Highway plazas, the Asset has Single, Return, Local Commercial, Local Personal, Monthly, and Local Monthly tickets.

2.9 There is a difference in toll rates of both the toll plazas since the structure length and bypass length are shorter on TP2: Vigakhet toll plaza in comparison to TP1 Babina toll plaza.

2.10 Due to general elections in India from Apr-May'24 the toll rates on National highways across the country for next financial year were applicable Jun'24 onwards instead of Apr'24. For FY26 the toll rates changed from Apr'25.

Table 2-2: Single toll rates on the Asset (INR), applicable Apr 2025 to March 2026

Type of Vehicle	Single Journey Fee	
	TP1 Babina	TP2 Vigakhet
CJV	125	90
LCV	200	145
Bus/Truck	420	310
3A	460	335
MAV	660	485
OSV	800	590

Key economic activities

The Asset is situated in the state of Uttar Pradesh. Uttar Pradesh is the third largest economy and the most populous state in the country, accounting for 16% of India's total population which also makes its high consumer base a key factor that contributes to the GDP. Agriculture is the most important and the biggest sector in the state economy followed by the service sector comprising of travel, tourism, real estate, insurance, and the finance industry. State's real GSDP for 2023-24 was INR14.23 trillion, having grown at 5.7% CAGR between FY16 and FY24, contributing 8.2% to the national GDP.

Economic Activity Around Asset

2.11 The northern end of the Asset, Jhansi is a city of historical relevance in the Bundelkhand region. Being the only city with presence of both, East-West highway corridor (NH27) and North-South highway corridor (NH44), Jhansi has observed development in infrastructure and real estate sectors over the years. Jhansi is also one of six nodes identified as defence corridors where industries will be set up to meet the needs and requirements of the country's defence sector. A Defence Park is planned to be established in Jhansi for automobiles manufacturing for military, police modernization, forensics centres, aircraft/helicopter manufacturing/ assembling units, testing facilities for military equipment, drone manufacturing and testing facilities.

1. In October 2025, the Uttar Pradesh government announced multiple infrastructure and industrial initiatives in the Bundelkhand region, covering Jhansi and Lalitpur districts including three solar plants totalling 2,000 MW capacity, with Hinduja Group setting up a 600 MW plant in Jhansi and NTPC Green Energy developing a 600 MW plant in Lalitpur. The projects, worth ₹10,000 crore, are expected to be operational by December 2025, generating green energy.[1]

2.12 The UP State Industrial Development Authority is also developing a Bulk Drug Pharma Park over 1,472 acres with an anticipated investment of ₹12,000 crore and job creation for approximately 14,000 people. The park will feature advanced infrastructure and is expected to be operational within 2–2.5 years.[2]

2.13 Concrete and granite stone mines are present throughout the state and are used for construction. Stone crusher plants are present at Bijoli, 12 km from Jhansi along the Asset, which produce aggregate for construction. The same is transported to the rest of the state. Bijoli is also home to cement, bricks and pipes as well as machine parts industries.

2.14 There are two thermal power plants present near the Asset namely, Parichha Thermal Power Plant (near Jhansi) and Lalitpur Power Plant (near Lalitpur).

2.15 Diamond Cement Factory has a grinding unit at Jhansi where one of the raw materials, fly ash, is transported from Lalitpur power plant using the Asset.

2.16 Since the economy of Uttar Pradesh is mainly based on agriculture and around 65% of the population is dependent on agriculture, the Asset observes Agri-products as a key commodity transported. Agriculture related Pradeshik Co-operative Federation warehouse is also located near Vigakhet which is further expected to generate Agri-related traffic on the Asset.

2.17 Being a part of the long-distance strategic corridor of NH44, key commodities moving on the Asset include tomato, rice, potato, manufacturing products, parcels, and a small proportion of automobile traffic.

Alternate Routes

2.18 An alternate route between Jhansi and Sagar via Tikamgarh is also present and bypasses the toll plazas. The route is 32 km longer than the Asset route. This alternate is of an uneven width for the most part. The route is also closed during the rainy season as water flows over the low-level bridge near Orchha. Due to this reason, the route isn't preferred by general traffic and is not considered to be impacting the traffic on the Asset.

2.19 The National Highway Authority of India (NHAI) is building an ~1382km long greenfield expressway connecting Delhi and Mumbai. It is an 8-lane access-controlled route with 4 lanes in each direction connecting Delhi-Noida Direct (DND) Flyway in Delhi with the Jawaharlal Nehru Port Trust (JNPT) in Mumbai. A few sections of the greenfield expressway have been made operational with Sohna-Dausa-Lalsot section (Feb'23), Madhya Pradesh section (Sep'23), Vadodara-Bharuch section (Feb'24), Lalsot-Sawai-Madhopur section (Feb'24) and the Kota-Bundi Section (Dec'24) already being

[1] **Solar Plants in Bundelkand**

[2] **Pharma Plant in Lalitpur**

operationalised. The project is currently suffering from construction delays, mainly on the Gujarat stretch. The timeline for completion of the expressway has been revised several times and is now expected to be completed by 2027 as per reports[3]. It is key to note that while certain sections of the Rajasthan expressway lack direct connectivity, they are effectively linked via state highways.

2.20 Like the DME, the ~1,271 km long Surat-Solapur-Chennai Expressway will connect Surat and Chennai via Solapur, Kurnool, Kadapa, and Tirupati. Once the expressway is constructed, traffic coming from Delhi/ north and travelling to Kurnool/south will have the option to use DME till Indore followed by NH52 till Solapur followed by the Akkalkot-Chennai section of the planned Surat Chennai Expressway from Solapur to Kurnool and beyond. This new alternative will provide the option of using expressways for ~60% of the total journey distance and hence, a share of Delhi-Kurnool and south specifically Chennai bound traffic is expected to have an alternate route choice.

2.21 Further, DME provides a faster access to Indore and post which the users can reach Solapur via Dhule – Aurangabad. After Solapur, the route to reach Chennai can either be via Surat Solapur Chennai expressway.

2.22 Currently the existing sections between Indore and Hyderabad are getting widened from two lanes to four lanes as part of Indore Hyderabad Economic Corridor.

- The sector between Indore and Khandwa (164 Km) is getting upgraded as a part of brownfield expansion.
- The section between Khandwa and Akola (146 Km) is proposed to upgrade as a part of greenfield expansion (however very limited information is available on this greenfield development).
- The section between Akola and Hyderabad (NH161) is majorly four-laned.
- The 40 km long Kandi to Ramsanpalle section of NH161which was two laned has been recently inaugurated by Prime Minister in Mar'25 after it's completion of four laning[4].

2.23 Once the widening of the existing alignment is completed, the route via Indore, Akola, Nanded will provide an alternate route traveling between Madhya Pradesh/ North and Hyderabad/South.

2.24 Thus, the Indore-Hyderabad Economic Corridor will act in conjunction with the Delhi-Mumbai Expressway and the Surat-Chennai Expressway to form an alternate route to the Asset for North-South traffic. The detailed impact of this composite alternate is discussed in Chapter 6.

2.25 The 4 laning of Satna-Chitrakoot-Prayagraj section of NH30 is a lane augmentation project on the east of the Asset. It will have impact on traffic between Lucknow and north and Nagpur and south. There is no official information to suggest when this project may be completed. Reports online suggests the project is expected to start construction in 2026.

---

[3] https://infra.economictimes.indiatimes.com/news/roads-highways/delhi-mumbai-e-way-unlikely-to-be-completed-before-2027/118236682

[4] **Hon'ble Prime Minister today inaugurated the 40 km long four-lane #Kandi-#Ramsanpalle section of NH-161 in #Telangana**

Once the 4-laning is completed, this section will act as an alternate to our Asset for the traffic commuting between Lucknow - Nagpur.

3 Traffic Description

Introduction

3.1 This chapter outlines the current traffic and revenues on the Asset, as well as our analysis of origin-destination (OD) data and traffic count data. This covers data which was collected as a part of the study in the previous commission, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, as well as the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

3.4 The below sections present historical traffic and revenue information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.

PCU Factor assumption for reporting

3.5 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'.[5] For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2026 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3-1: PCU factors

Vehicle Category	PCU Factor
CJV/ Mini LCV	1.0
LCV	1.5
Bus/2A	3.0
3A	3.0

[5] IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas

Vehicle Category	PCU Factor
MAV*	3.37
OSV	4.5

Source: Steer analysis and IRC64,1990, * Rigid-Trailer combined PCU

Historical trends

3.6 Table 3-2 illustrates the traffic data over the period of 5 years from October 2020 – September 2025 (provided by the Client) at a plaza level. There is lack of long-term historical data available on the Asset since tolling was started by the client only in October 2020 and both the available years of data, FY21 and FY22 were impacted by COVID-19 related restrictions. Therefore, starting FY23 traffic on the Asset has started to get normalised with normal travel patterns recorded FY24 onwards.

Table 3-2: Average Daily Traffic data of TP1 Babina

Vehicle category	FY21	FY22	FY23	FY24	FY25	FY26	CAGR FY23 -26
CJV	2,794	2,872	3,040	3,157	3,353	3,698	6.8%

Tollable PCU	**15,027**	**14,976**	**16,645**	**17,392**	**18,696**	**19,946**	**6.2%**

Source: Steer analysis of Client data, (*12 days of data was available for Oct'20 FY26 data is from Apr'25 to Mar'26; Tollable traffic excludes exemptions and violations

3.7 As per the reported data, it can be observed CJVs make up 40% of traffic in FY26 which can be attributed to short distance movement from Jhansi and surrounding region in proximity. Whereas 2A, 3A and MAV account for a total of nearly 54% of the traffic as the Asset is a part of the traditional North-South long-distance corridor and caters to many goods vehicles doing long distance North-South movement between Delhi/North and Nagpur/South.

3.8 3A category has largely growth at a 3.2% CAGR in the FY23-26 period. The reduction/stagnation in 3A volume is a result of the declining demand for 3A vehicles, which are being replaced by 2A and MAVs. MAVs offer higher tonnage capacity making them more cost-effective for transporters. While the increase in 2A volume reflects the growing preference for these vehicles due to favourable changes in the legal permissible loads for 2As and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. This is consistent with our discussion with various transporters and OEMs across the country who are favouring 2A and 5A vehicles for commodity movement due to better unit economics.

3.9 Based on the FY26 data provided by the client, movement of MAVs has declined by 3.5% compared to FY25. This reduction is primarily attributed to the diversion of north–south traffic onto the Delhi–Mumbai Expressway, as well as the rerouting of traffic from East Uttar Pradesh towards Nagpur and southern regions via NH30 (Rewa–Katni–Jabalpur–Nagpur), following the completion of the Katni Bypass in June 2025. During the site visit it was observed that congestion was caused by: (i) construction of a VUP on the intersection between NH27 and NH44 to the north of Jhansi; and (ii) construction of a flyover on NH27 near Bundelkhand University on the Kanpur-Shivpuri stretch. Since September 2025, it is understood that the congestion has been more streamlined.

3.10 2A and 3A continues to be positive in FY26 as well signalling a strong demand generated by cities such as Nagpur, Bangalore, Chennai originating from Gwalior and North Indian states like Delhi NCR, Punjab and Haryana and vice-versa. Traffic volumes observed at Vigakhet toll plaza are presented below.

Table 3-4: Average Daily Traffic data at TP2 Vigakhet

Vehicle category	FY21	FY22	FY23	FY24	FY25	FY26	CAGR FY23 -26
CJV	2,279	2,284	2,376	2,447	2,575	2,765	5.2%

Source: Steer analysis of Client data, (*12 days of data was available for Oct'20). FY26 data is from Apr'25 to Mar'26; Tollable traffic excludes exemptions and violations

3.11 Historically the traffic on TP2 as well has shown a healthy growth across categories with ~6.0% overall PCU growth for the period between FY23-FY26.

3.12 TP2 Vigakhet plaza lies south of Babina toll plaza and is a contiguous section. The traffic trends at both plazas are similar with similar seasonal impact as explained above. This is also validated with the toll plaza also reporting a very similar behaviour in the evolution of traffic since October 2020. There has been a growth in the 2A volume FY25 compared to FY24 due to increased category demand for long-distance movement. The tollable traffic at Vigakhet shows similar trend as the Babina Plaza.

3.13 Increase of approximately 13% has been observed in 2A vehicle traffic across both plazas, reflecting a broader trend along the corridor. Conversely, 3A vehicle growth has remained subdued, primarily attributed to an axle shift from 3A vehicles to MAVs.

Historical Revenue

3.14 In terms of revenue, CJVs contributes ~10% to the total revenue, while commercial traffic (2A, 3A and MAV) contribute ~86% in terms of revenue on Babina toll plaza with remaining shares by Bus and LCV.

3.15 Table 3-6 and Table 3-7 show the revenue by each vehicle type at the toll plaza at an annual level and at daily level.

Table 3-6: Total Revenue (in INR Cr) at TP1 Babina, and AADC (in INR Lakhs/day)

Year	CJV	LCV	Bus	2A	3A	MAV	OSV	Total	AADC	YoY %
FY21*	3.6	0.6	1.1	3.9	7.4	12.9	0.0	**29.5**	**17**	**-**
FY22	7.3	1.2	1.4	10.7	16.7	29.7	0.0	**67.0**	**19**	**11.8%**
FY23	8.3	1.5	1.7	14.7	19.2	36.4	0.0	**81.8**	**22**	**15.8%**
FY24	9.0	1.7	2.1	17.0	20.4	39.5	0.0	**89.7**	**25**	**9.4%**

Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; AADC represents Average Annual Daily Collection; FY26 is from Apr'25 to Mar'26.

Table 3-7: Total Revenue (in INR Cr) at TP2 Vigakhet and AADC (in INR Lakhs/day)

Year	CJV	LCV	Bus	2A	3A	MAV	OSV	Total	AADC	YoY %
FY21*	2.3	0.4	0.4	3.1	5.4	9.2	0.0	**20.7**	**12**	**-**
FY22	4.5	0.8	1.0	7.6	12.2	21.2	0.0	**47.2**	**13**	**8.3%**
FY23	5.1	1.0	1.2	10.4	14.0	25.7	0.0	**57.7**	**16**	**23.1%**
FY24	5.5	1.2	1.6	12.1	14.9	27.5	0.0	**62.8**	**17**	**6.3%**
FY25	5.8	1.5	1.5	14.6	15.2	30.5	0.0	**69.2**	**19**	**10.4%**
FY26	5.9	1.7	1.5	17.3	17.4	31.5	0.0	**75.4**	**21**	**8.9%**

Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; AADC represents Average Annual Daily Collection; FY26 is from Apr'25 to Mar'26.

3.16 It can be inferred from the data that major contributor to the revenue on the Asset is the MAV category which has a share ranging ~45% of overall revenue across the Asset.

3.17 The Babina toll plaza reported an AADC of ~INR 30 Lakhs in FY26 as compared to Vigakhet toll plaza which reported an AADC of ~INR 21 lakhs. TP1 observed a ~9% and TP2 at 9% increase in per day collection in FY26 which is mainly contributed by increased volume of LCV, 2A and MAV on the Asset. Since, both Asset carry similar traffic volumes, most of the revenue differences can be explained by the difference in toll rates charged, which in turn is due to the difference in tollable lengths.

Toll Frequencies

3.18 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the client. The most common ticket categories observed on a typical National Highway are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these passes instead of evading toll.

3.19 The following are the types of tickets being sold at the plazas of the Asset.

Table 3.8: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows for a return journey within a day with a 50% discount on the return trip.
Monthly Pass	Discounted single entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.20 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For some Assets, the Exemption and violations are at time reported together.

3.21 Generally, over the period the shares of single/return/monthly tickets tend to stabilise within 2-3 years of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns.

Introduction of Annual pass for CJVs

3.22 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.23 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

The Annual Pass aims to:

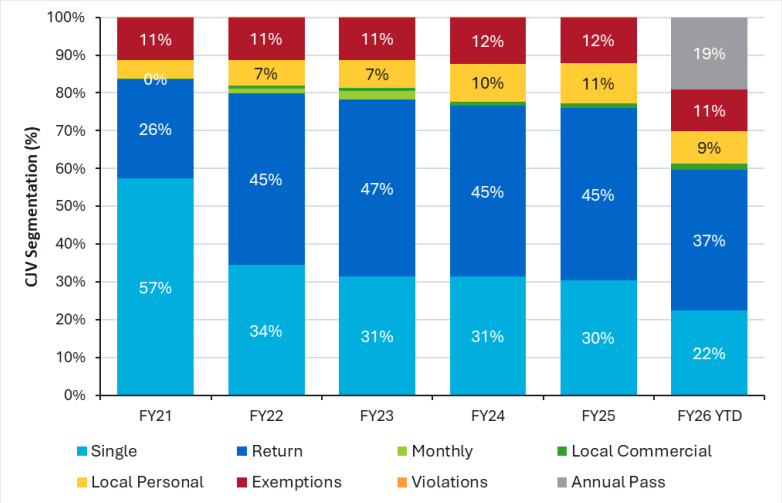
- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll road

Share of traffic by payment type

3.24 Since the Asset is located closer to urban clusters, it caters to a considerable number of daily commuters. This local movement results in multiple CJV trips through the plaza, leading to a higher share of return tickets for CJVs. On TP1, the level of exemptions is influenced by the higher share of local traffic on the plaza.

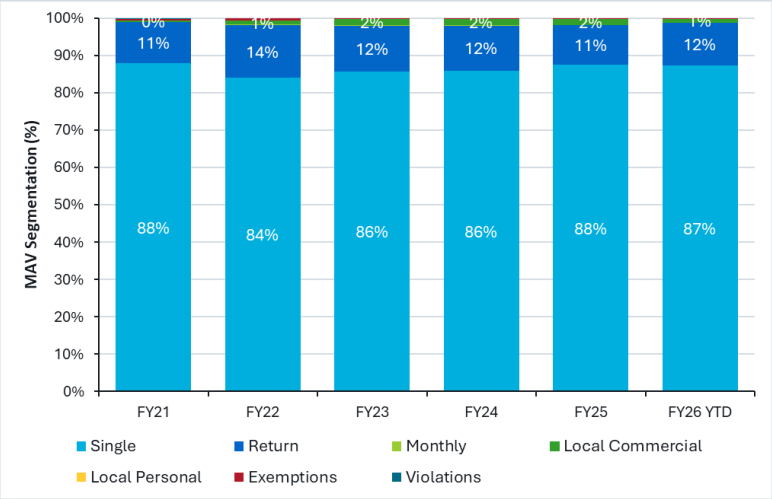
3.25 The CJV segmentation has decreased for single ticket type from FY22 to FY23 by approximately 3%, while the return ticket share increased by 2%. This minor shift can be attributed to the increasing adoption of FASTag by CJV users over the last three years. With the advent of annual passes, the segmentation of CJVs has also evolved since August 2025. The increase in annual passes can be seen to come from single and return categories primarily, with a marginal reduction also observed in exemptions and local personal ticket categories.

Figure 3-1: Ticket segmentation for CJV at TP1 Babina



Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD is data for 5 months from Apr'24 to Feb'26

Figure 3-2: Ticket segmentation for MAV at TP1 Babina



Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD is data for 11 months from Apr'25 to Feb'26

3.26 The trends observed in MAV segmentation for TP1 Babina are consistent between FY24 and FY26YTD. A considerable proportion of MAVs buying single tickets can be attributed to long-distance movement of traffic observed on the Asset. The same was verified from the OD data analysis with nearly 50% MAVs having trip lengths longer than 1,000kms and 50% MAVs having both ends of the trips out of Asset.

3.27 Table 3-9 presents data for FY26YTD (Apr'25 – Feb'26) segmentation for LCV, Bus, 2A and 3A category for Babina Toll Plaza:

Table 3-9: Ticket segmentation for LCV, Bus, 2A and 3A at TP1 Babina

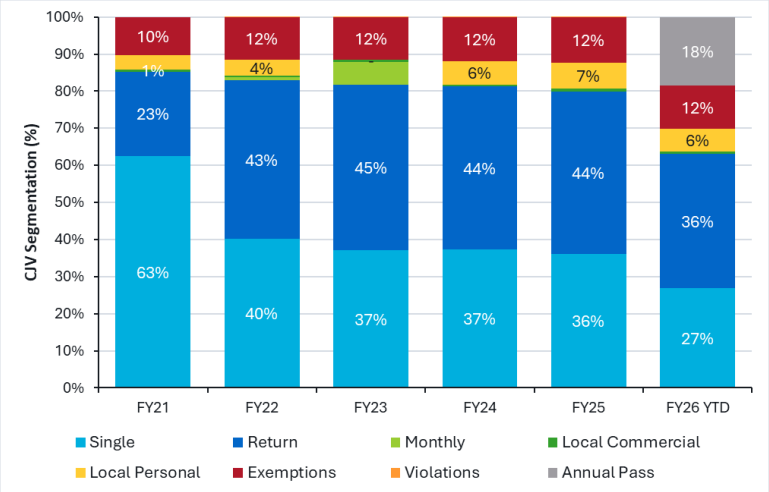
Ticket Category	LCV	Bus	2A	3A
Single	88%	36%	92%	96%
Return	11%	32%	6%	3%

Ticket Category	LCV	Bus	2A	3A
Local commercial	0%	31%	0%	0%
Exemption	1%	1%	2%	0%

Source: Steer analysis of Client data

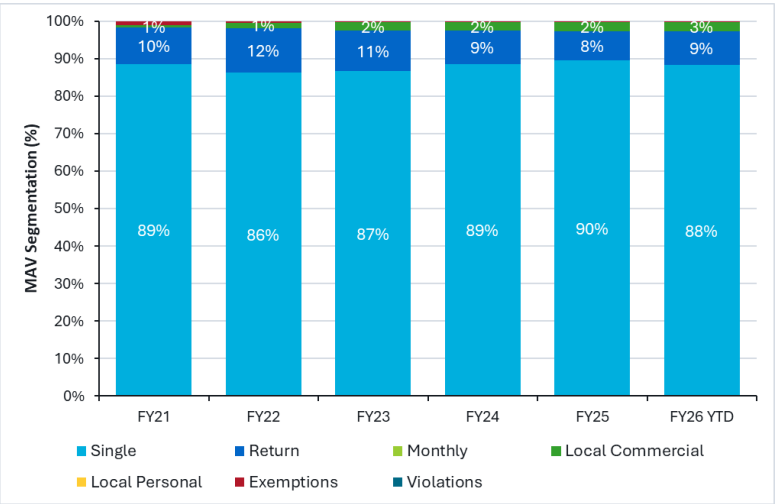
3.28 The segmentation for TP2, Vigakhet toll plaza is presented below:

Figure 3-3: Ticket segmentation for CJV at TP2 Vigakhet



Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD is data for 11 months from Apr'25 to Feb'26

Figure 3-4: Ticket segmentation for MAV at TP2 Vigakhet



Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD is data for 11 months from Apr'25 to Feb'26

3.29 Observations pertaining to ticket segmentation are similar on both toll plazas. The CJV segmentation shares have largely been consistent from FY23 and FY26YTD. On TP2 Vigakhet MAVs have exhibited similar trends when compared with previous years where single is dominant ticket category with more than ~85% share. These trips are primarily travelling between north and south India between Delhi NCR towards Bangalore and Chennai with trip lengths longer than 1,000kms.

3.30 Table 3-10 presents data for FY26YTD (Apr'25 – Feb'26) segmentation for LCV, Bus, 2A and 3A category for Vigakhet toll plaza:

Table 3-10: Ticket segmentation for LCV, Bus and 2A at TP2 Vigakhet

Ticket Category	LCV	Bus	2A	3A
Single	89%	40%	94%	96%
Return	9%	53%	4%	3%
Local commercial	1%	7%	0%	1%
Exemption	1%	0%	1%	0%

Source: Steer analysis of Client data

Data Collection exercise

3.31 As mentioned previously, to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset in earlier commissions, comprising the surveys listed in the table below. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3-11: Data collection exercise

Toll Plaza	3/7-day videography-based TVC			1-day OD survey	
	Start date	End date	Time (hrs)	Start date	Start time
TP1 Babina	29 Jan 2024	31 Jan 2024	0000-2359	30 Jan 2024	0900 hours
TP2 Vigakhet	23 Feb 2026	25 Feb 2026	0000-2359	24 Feb 2026	0900 hours

Source: Steer analysis of TVC data

3.32 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, to fully understand the impact of this weekly fluctuation on the Asset, we collected three and seven-day counts respectively at each toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.33 Taking an average of the three-day TVC counts (23 – 25 Feb 2026) at Vigakhet and three-day TVC count (29–31 Jan 2024) at Babina, we obtained the following average daily traffic (WADT) for each toll plaza. This WADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Table 3-12: WADT from TVC counts

Toll Plaza	CJV	Mini LCV	LCV	Bus	2A	3A	MAV	Total
TP1 Babina	3,238	623	390	151	1,118	1,140	1,731	**8,395**
TP2 Vigakhet	2,784	570	546	131	1,686	1,516	1,945	**9,180**

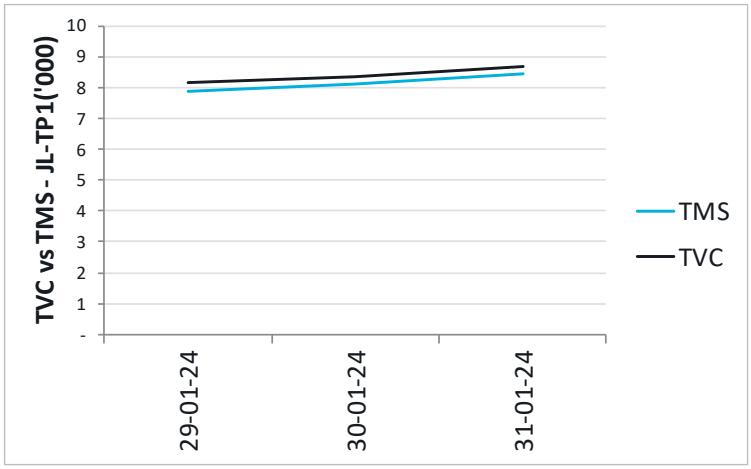
Source: Steer analysis of TVC data; Babina and Vigakhet average is of 3 days of data

TVC v/s TMS analysis

3.34 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those days, as provided by the Client.

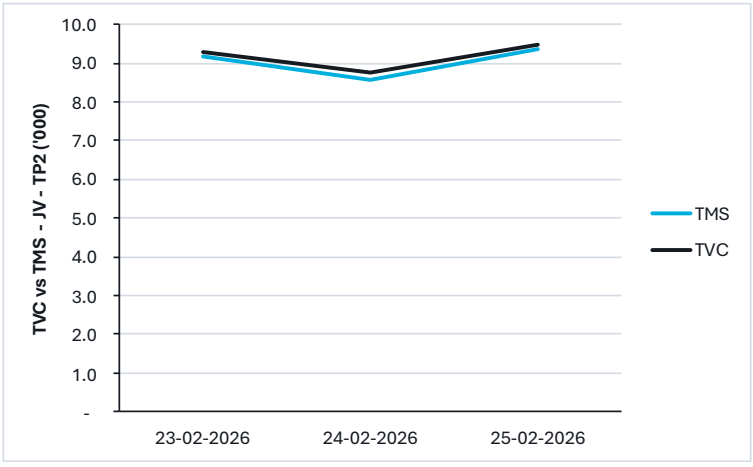
3.35 The following figures show the comparison between the daily traffic observed by TVC and TMS for the two toll plazas.

Figure 3-5: Comparison between TVC and TMS daily traffic data on TP1 Babina



Source: Steer analysis of TVC and Client TMS data

Figure 3-6: Comparison between TVC and TMS daily traffic data on TP2 Vigakhet

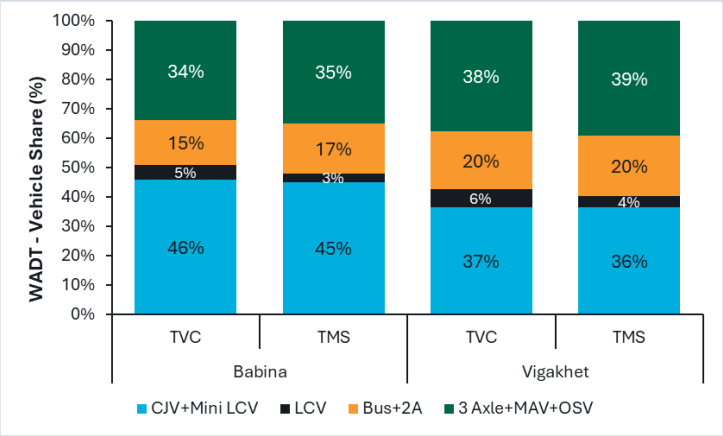


Source: Steer analysis of TVC and Client TMS data

3.36 Figure 3-7 compares the shares of vehicle types at both toll plazas observed by the TVC and TMS data. As can be seen, whilst the share of Bus+2A and 3A+MAV+OSV is marginally

higher in TMS compared to TVC, it is lower for CJV and LCV category. This difference can be attributed to common misclassification of vehicle categories.

Figure 3-7: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.37 Considering the variation between the TVC and TMS data is within 2%, the TMS data is within the confidence levels and has accordingly been used to estimate base year traffic.

Key findings of origin-destination analysis

Overview

3.38 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. As mentioned previously, the OD analysis presented here has been based on the data collected on 30th-31st January 2024 at TP1 and 24th-25th February 2026 at TP2.

3.39 As part of our previous assignment, we have analysed the regional drivers of demand based on the following analyses:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.40 While zonal analysis and the list of top OD pairs help to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.41 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TMS data) during the same time period. The Table 3-13 below presents the sample rates for key vehicle type aggregations at the toll plaza. We believe that the sample rates of the OD data are reasonable for the analysis required.

Table 3-13: Sample rates for OD data

Vehicle type	TP1 Babina	TP2 Vigakhet
Passenger (CJV+Bus)	18%	23%
Goods (LCV+2A+3A+MAV)	62%	45%

Source: Steer analysis of OD data

Zone categories

3.42 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states, and regions in the vicinity of the Asset, we have aggregated zonal data as described in Table 3-14 below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Asset being studied.

Table 3-14: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of Uttar Pradesh	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Madhya Pradesh	Madhya Pradesh state
Delhi	Delhi State, including New Delhi
North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir
West India	Rajasthan, Gujarat
Central India	Chhattisgarh
East and North-eastern India	West Bengal, Jharkhand, and Northeast Indian states
South India	Tamil Nadu, Karnataka, Kerala, Andhra Pradesh

Source: Steer analysis

Zonal influence

3.43 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence at each toll plaza of each Asset, based on zonal aggregation listed in the previous sub-section. It should be noted that zonal influence is analysed on trip ends and not trips.[6]

3.44 It can be seen from the figures below that CJV and Bus categories are dominated by local and IAOI trips on both the toll plazas. The share of local trips for CJVs is more on TP1 as it is in close vicinity of Jhansi whereas Vigakhet is comparably distant from Lalitpur.

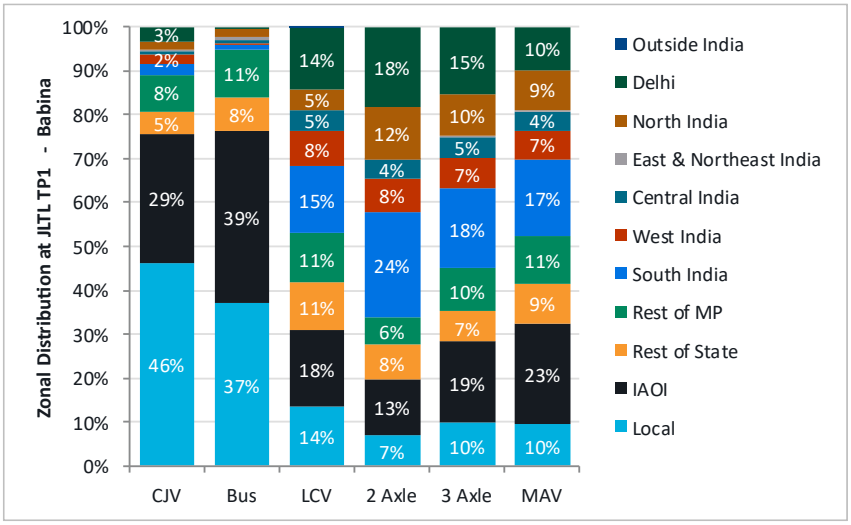
[6] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

Moreover, Babina itself is economically more developed when compared to Vigakhet. Similarly, since Lalitpur is near Madhya Pradesh, significant number of Madhya Pradesh trips also get added on TP2.

3.45 Since the Asset lies on the preferred route for traffic commuting between Delhi-NCR and Bangalore, the southern India zones and the Delhi zones have the highest and the second highest proportion respectively on both the toll plazas across all goods categories. The shares of other zones are comparable across all the categories. Since TP1 is near NH27 (East-West corridor), the share of Northern India trips is higher on TP1 than TP2. Similarly, since TP2 is near Madhya Pradesh which witnesses the higher share of Madhya Pradesh trips.

3.46 In the charts shown below, it will be noticed that TP1 and TP2 despite being adjoining, show slightly different influences for MAVs. With the proximity of TP1 to Army base camp - the influence of local movement is higher on TP1 Babina. For this same reason, the share of Delhi/North bound trips on TP2 Vigakhet is higher around 28% than TP1 of 19%. Another reason which has affected the long-distance traffic results is the surveys undertaken on TP1 in 2024 was during January which was impacted due to dense fog situation. Therefore, resulting in affected long distance traffic movement.

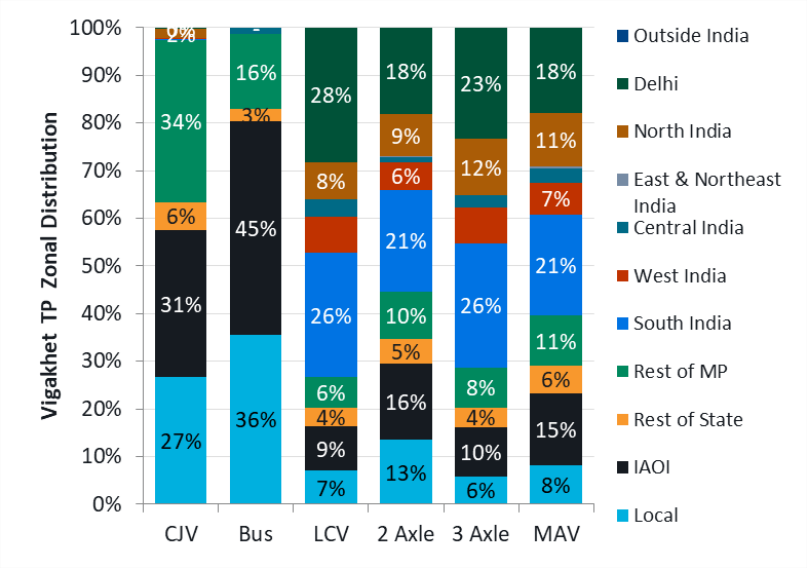
Figure 3-8: Zonal influence at TP1 Babina



Source: Steer analysis of OD data

3.47 In comparison to our previous OD results, it was found that influence of local movement and trips have increased on TP1 Babina where the share of Rest of State and Internal trips increased by 14% for MAVs. In terms of commodity distribution, the Agriculture and Grocery share has decreased from 28% to 20%, while the Manufacturing share has also increased by 5% from 14% in 2024 OD results when compared to 2023.

Figure 3-9: Zonal influence at TP2 Vigakhet



Source: Steer analysis of OD data

3.48 Given the strategic nature of the Asset, facilitating north-south movements via NH44 a, the zonal influence of this Asset is diverse. Significant zonal influence of Delhi-NCR, North India (UP, Haryana), South India (Tamil Nadu, and Karnataka) is observed for heavy vehicles (2A+3A+MAV).

3.49 Zones that are located within Uttar Pradesh, collectively contribute to 25-30% in case of 3A and MAV. The remaining 75% is a diverse mix of other zones, including Delhi, Haryana, Rajasthan, south India, Maharashtra, among others. The long-distance nature of this Asset is evident from ~25% share of zonal influence of South India in case of 2A/3A vehicles, followed by major shares of Delhi, Haryana, and Maharashtra.

Internal External analysis

3.50 Internal-External analysis helps in identifying the trips which have both the origin and destination on the Asset (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). 'Internal' zones are those that were analysed as 'local' in the zonal influence analysis, i.e., lying on the Asset, while 'External' zones are all other zones.

3.51 The figures below show the distribution of trips for MAV for both TP1: Babina and TP2: Vigakhet. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.52 The internal-external distribution further validates the strategic nature of the asset, with 60% influence pertaining to zones that are external at both the plazas. This is further to the zonal distribution that showed that Local and Rest of the State had relatively less influence on the Asset, while aggregate of the remaining zones categorized as External exert the significant proportion of influence on the traffic. This validates that the long-distance nature of the Asset, facilitating long distance through movement—that is trips that originate and end outside of Uttar Pradesh, traversing via the Asset. However, there is a difference in the External-External share at Babina is 17% lower for MAV than at Vigakhet. The high share of external trips infers the presence of majorly through long

distance traffic on the Asset. The Asset is used by through traffic commuting between Uttar Pradesh/Delhi/northern state and southern states of Karnataka and Chennai.

Figure 3-10 Internal-external distribution at TP1 Babina

	Internal	Rest of State	External
External	22%	8%	37%
Rest of State	2%	1%	4%
Internal	14%	2%	10%

Source: Steer analysis of OD data

Figure 3-11 Internal-external distribution at TP2 Vigakhet

	Internal	Rest of State	External
External	14%	4%	54%
Rest of State	2%	-	5%
Internal	9%	1%	12%

Source: Steer analysis of OD data

Commodity distribution

3.53 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the Table 3-15 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3-15: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane,Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, ghoat, cow,cattle food etc)	LIV	

Commodity Description	Code	Combined codes used for charts
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread,cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids,Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood,Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, House hold items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

3.54 The following figures present the commodity distribution for goods vehicles at the toll plaza at the total level and split by direction, towards Jhansi and towards Lalitpur.

3.55 As observed during our site visit, majority of the 2As and 3As at both the plazas were carrying miscellaneous commodities (parcels, couriers, household items). This is due to the fact the Asset connects Delhi-NCR to the Central India (Nagpur) and the e-commerce hub in Chennai, Bangalore, and Hyderabad. It must be noted that the trucks carrying such miscellaneous items are largely carrying e-commerce deliveries from various hubs.

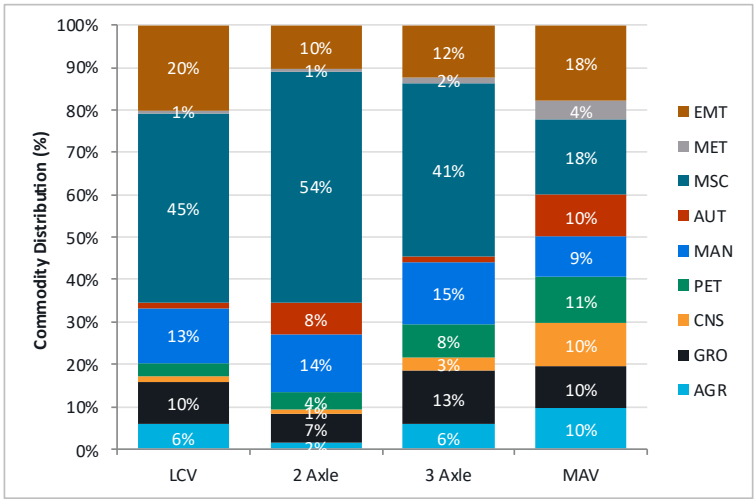
3.56 Automobiles are another significant commodity, with over 7% share of MAV on both plazas. This is because there are automobile manufacturing hubs both north (Delhi NCR) and south (Chennai, Bangalore) of the Asset.

3.57 Manufactured items are the Third most common commodity being transported using 3A and MAV trucks whereas automobiles are the second highest commodity of 2A. According to the OD analysis, manufactured items are transported using this route as it connects major hubs like Delhi-NCR, Chandigarh, Nagpur, Bhopal, Raipur, Bangalore, Hyderabad, and Kolkata.

3.58 Groceries also account for second most common commodities on TP2 and a significant proportion on TP1, transported on the Asset. s. Since the asset links cities such as Jhansi, Gwalior, Agra, Sagar and other key cities in Uttar Pradesh and Madhya Pradesh, these daily consumption items are observed in high proportion.

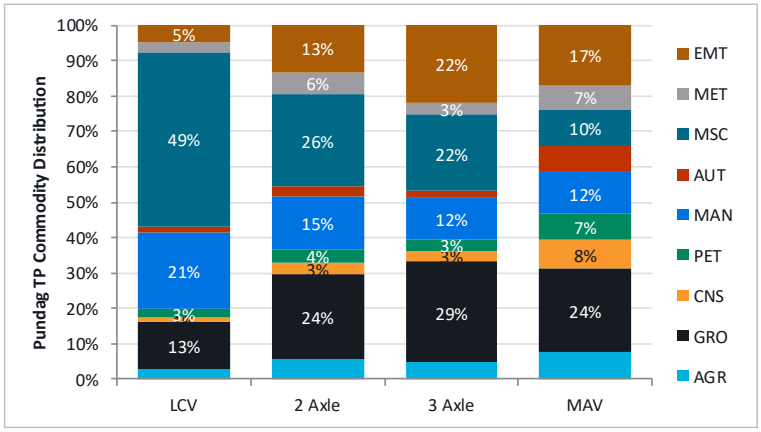
3.59 Commodities such as apples, wheat, potato, and mango are carried from northern states such as Uttar Pradesh, Punjab, Himachal Pradesh for consumption in southern states of Karnataka, Tamil Nadu and Telangana. Whereas commodities such as rice and banana are carried from southern cities of Bangalore, Puducherry, and Chennai for consumption in norther states of Delhi, Uttar Pradesh, Punjab.

Figure 3-12: Commodity distribution at TP1 Babina



Source: Steer analysis of OD data

Figure 3-13: Commodity distribution at TP2 Vigakhet



Source: Steer analysis of OD data

Trip length analysis

3.60 Trip-length distribution provides the distance-based profile of various vehicle types. This aids in validating assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorized distances into 5 groups – local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (1,000 – 5,000 km).

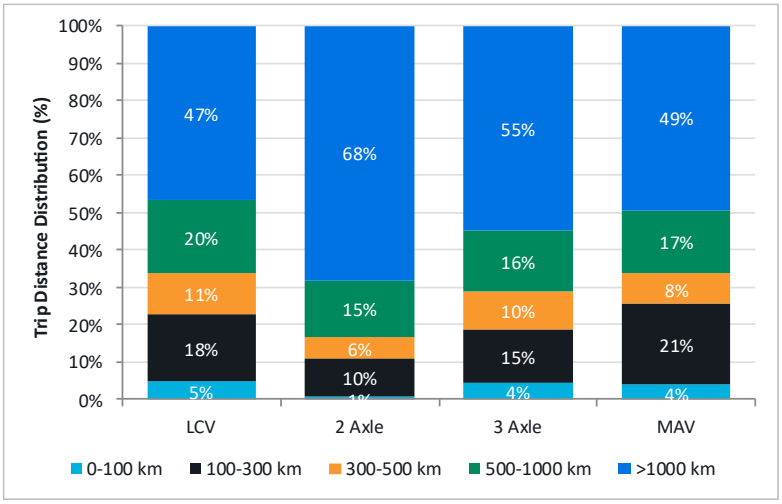
The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[7]

3.61 As observed in Internal-External analysis, the Asset is majorly being used by through traffic for goods vehicle categories. The same is validated by the figures below as for 2A/3A/MAV trucks, trips which cover greater than 1000 km distance have a high proportion on both the toll plazas. These trips are majorly between Delhi NCR/Punjab/Uttar Pradesh on one end and Nagpur, Hyderabad, Bangalore and Chennai on the other end.

3.62 As understood from the zonal distribution and commodities' distribution, that the strategic nature of this Asset serves long-distance north-south/west movements. Accordingly, over 60% of the trip distances in TP1 and 25% of the trip distances in TP2of 2 Axle, 3 Axle and MAV are traveling very long-distance movement of over 1,000 km.

3.63 There is a difference between the proportion of MAV travelling over 1000 km on both the plazas, with TP1 at 49% and TP2 at 32% respectively. This is likely on account of the survey at Babina being conducted two years prior to the survey conducted at Vighakhet.

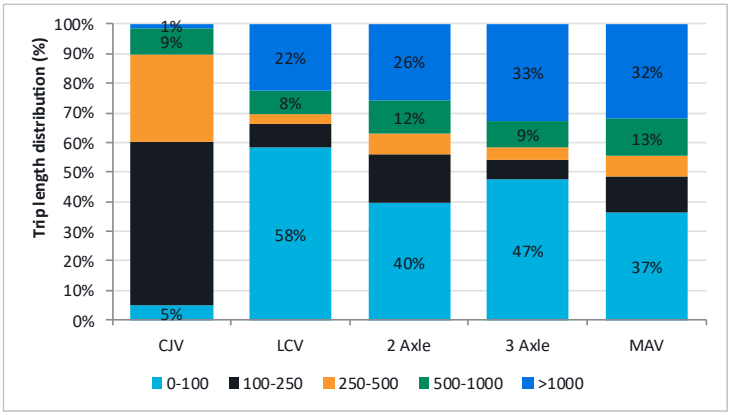
Figure 3.14: Trip distance distribution at TP1 Babina



Source: Steer analysis of OD data

[7] **Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link:** https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by Figure 3.using macro-enabled Excel, R, etc.**

Figure 3.15: Trip distance distribution at TP2 Vigakhet



Source: Steer analysis of OD data

Conclusions

3.64 Traffic on the Asset is dominated by CJVs which make up approximately 35% of the total composition on both the toll plazas. 3A and MAVs, collectively, make up around 40% of the total composition on both the toll plazas. Apart from the mentioned categories, both the toll plazas observe around 18% 2A, 2% Bus, and 5% LCV traffic. In terms of revenue, CJVs contribute around 10% to the total revenue, while commercial traffic (2A, 3A and MAV) contribute ~87% in terms of revenue.

3.65 For MAVs Single tickets have remained dominant, holding a share of over ~85% across years at both the plazas. The proportion of exemptions and local personal in CJV has remained constant ~10-12% and ~6-12% on both the plazas over the years. An analysis of LCV segmentation reveals an increasing share of single-ticket transactions by 1.8% and 1.4% at Babina and Vigakhet resp., suggesting a trend toward longer trip distances. The Asset observes almost negligible violations.

3.66 The TVC data shows minor variation on the TMS data, where at the total level of TVC is approximately 3% higher than the TMS data. However, the difference is negligible for the larger revenue generating categories (3A, MAV, and OSV combined), 0.4% at a total level.

3.67 The OD analysis found that in terms of zonal influence, both TP1 and TP2 observe high share of local and IAOI trips for CJV and bus categories. On the other hand, maximum trips for goods vehicles are originated/destined out of the state and hence both the toll plazas have average 26% local and IAOI trips only for MAVs vehicles. The key commodities transported on the Asset includes parcels, couriers, and grocery products, which when combined, make up around 42% of the commodity share for MAV traffic on both the toll plazas. Automobiles are another category which contribute nearly 10% of MAV traffic.

3.68 When considering the internal and external distribution, it is observed that External/Through trips dominate for 3A and MAV categories suggesting rest of states as origin and destination of truck traffic. Since, majority of the traffic is attributed to external zones, it can be inferred that the traffic is greatly through in nature and the growth of traffic is directly proportional to the growth of other influencing state. The trip analysis supports these findings, with 3A traffic having 55% and 33% share and MAV traffic having 49% and 32% share of trips ending post 1000 km distance on TP1 and TP2 respectively.

3.69 Overall, the Asset has benefitted from the strong traffic volumes observed on the NH44/7 corridor connecting Delhi in the north to cities like Nagpur, Hyderabad, Bangalore and Chennai in the central and southern region.

4 Socio economic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the roads are in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions in the regions where the Asset are located and the country. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Asset.

4.2 In turn, the change in the relative competitive position of the Asset (and thus of the traffic capture they can achieve) derives from how the relative offer for the roads changes, i.e. the service offered, and the tolls charged on the project roads, in comparison to that on competing roads; and whether any competing road facilities are planned.

4.3 In this chapter, we have assessed the trends of the above growth drivers, as indicators of the socio-economic conditions in the regions surrounding the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in the Uttar Pradesh state, where the Asset are located.

National level

4.5 Table 4-1 below shows that the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4-1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 – 1985]	2.3%	1.9%	3.8%
1985 – 2000	2.0%	1.7%	2.9%
2000 – 2015	1.5%	1.0%	2.6%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth.

State level

4.6 Table 4-2 shows the evolution of population in Utter Pradesh state compared to that of the country. Overall, as can be seen, the trend observed at the country level is also noticeable at the state level, namely, a move towards urban agglomeration with the growth in rural population being slower than that of urban population. Further, the state has grown at a higher rate than the country average, between 2012-2024.

Table 4-2: Population Growth in Uttar Pradesh and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Uttar Pradesh	201	237	**1.4%**
India	1,210	1,395	**1.2%**

Source: MoSPI Estimates

4.7 Due to the complexities of the patterns in which urbanisation takes place, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide a socio-economic context of the state/trends in the regions in which the Asset are located.

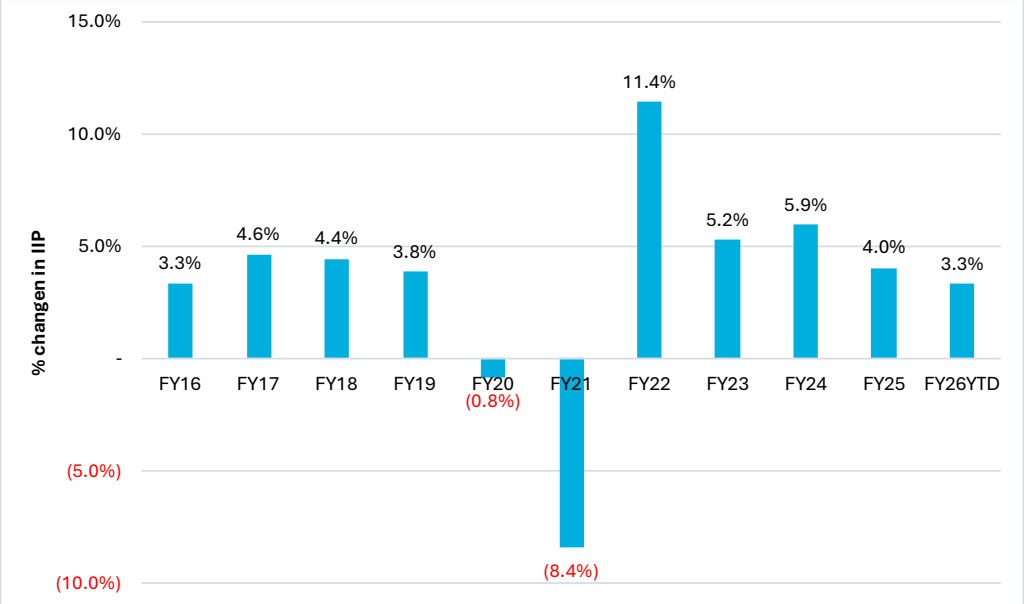
Economic Indicators

Industrial Production

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.9 The figure below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4%, and FY26YTD (till February 2026) recording 3.3% growth over FY25.

Figure 4-1: Annual growth – Index of Industrial Production (FY16-FY26YTD)



Source: Ministry of Statistics and Program Implementation (MoSPI). FY26YTD represents data till Feb'26

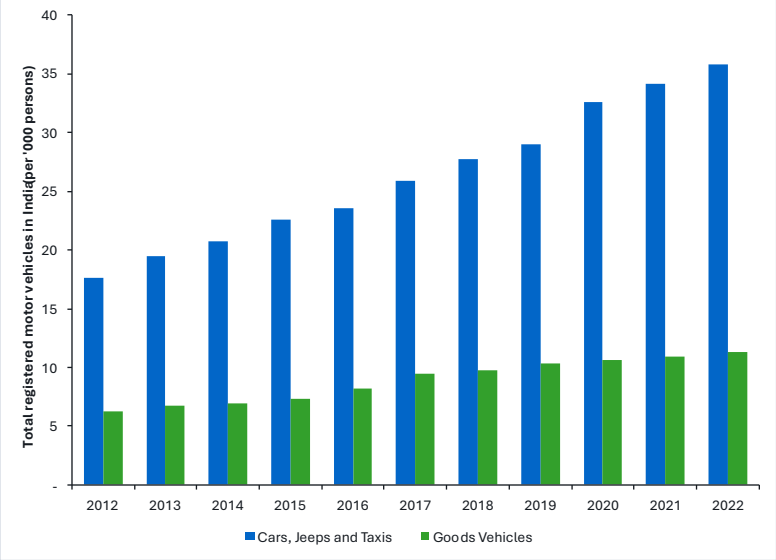
4.10 Since state-level IIP data is not as readily available as national-level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MoSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle Ownership

4.11 The gap in car ownership between India and developed nations remains substantial – with 36 cars/jeeps/taxis and 11 commercial vehicles per thousand people, as of FY22 (the latest year for which official data is available). However, with increasing per capita income levels, a booming economy and the subsequent increase in demand for mobility, the number of registered vehicles has been on a gradual upward trend

4.12 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. Between FY12 and FY22, the CAGR for CJV and goods' vehicles registered in India was 8.6% and 7.3% respectively.

Figure 4-2: Total number of registered motor vehicles in India (per 1000 population)

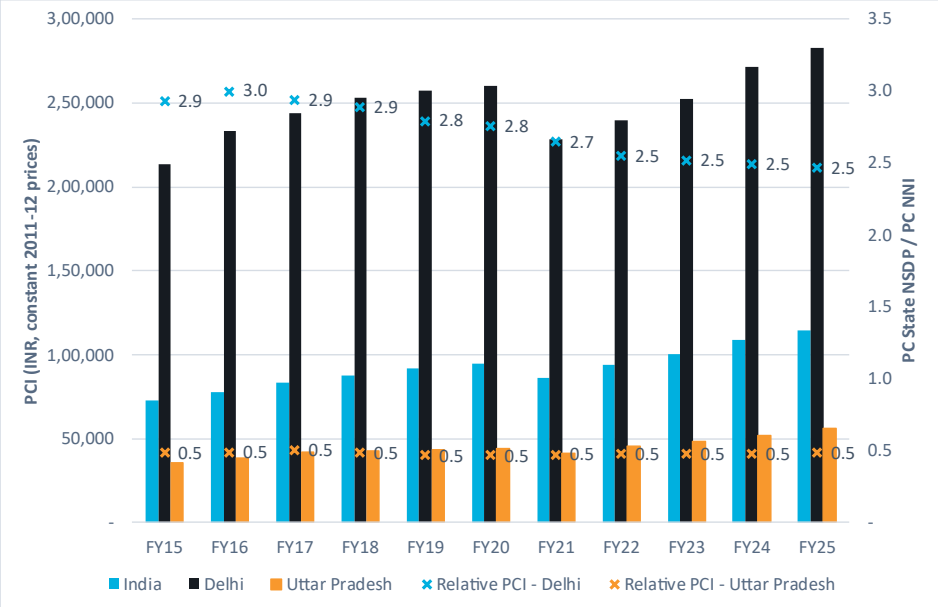


Source: Ministry of Road Transport and Highways (MoRTH)

Per Capita Income (PCI)

4.13 The per capita income of the state where the Assets lies i.e., Uttar Pradesh is lower as compared to the national average. In dollar terms, PCI of just $1,000 per head indicates that the state is at a very early stage of consumption curve. Going forward, we therefore expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

Figure 4.3: Per capita income



Source: Steer Analysis of MoSPI data

4.14 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, the long-term forecast for PCI is not available we therefore refrain from using it to forecast traffic.

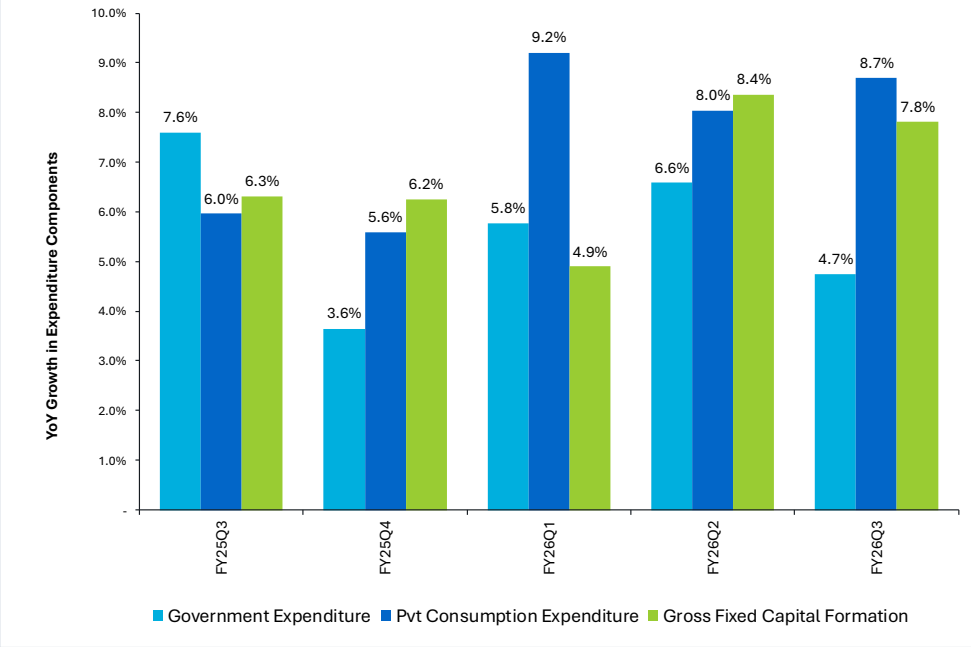
Economic growth

India's Performance

4.15 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q3 GDP at 7.8% over FY25Q3. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[8].

4.16 The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past year (FY25Q3-FY26Q3).

Figure 4-4: YoY growth in expenditure components of GDP



Source: Steer Analysis of MOSPI Data

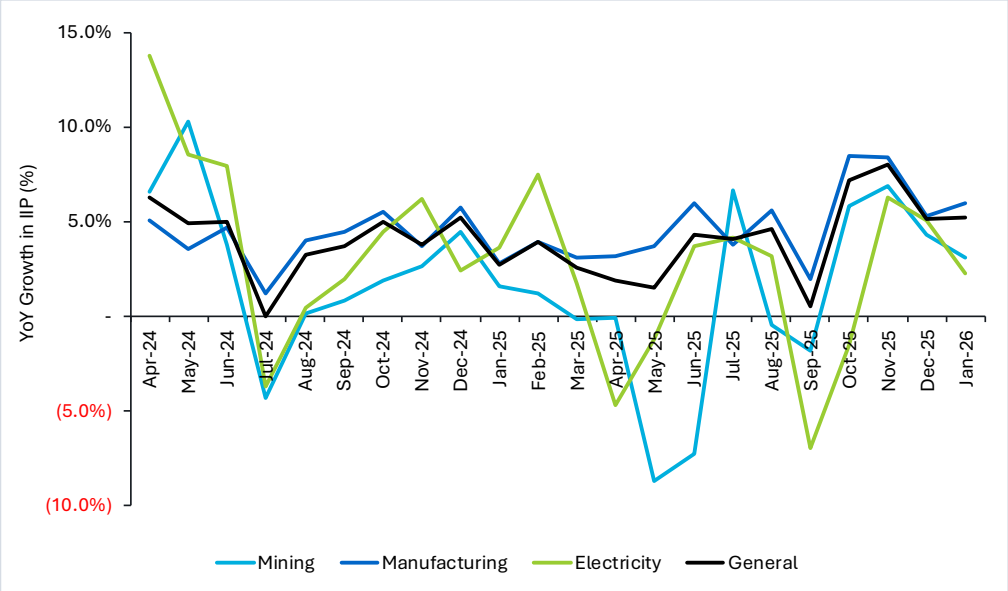
4.17 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 5.8% growth over FY25Q1 levels.

4.18 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr'25-Feb '26), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the

[8] Gov**ernment of India PIB Release (27th February 2026)**

two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

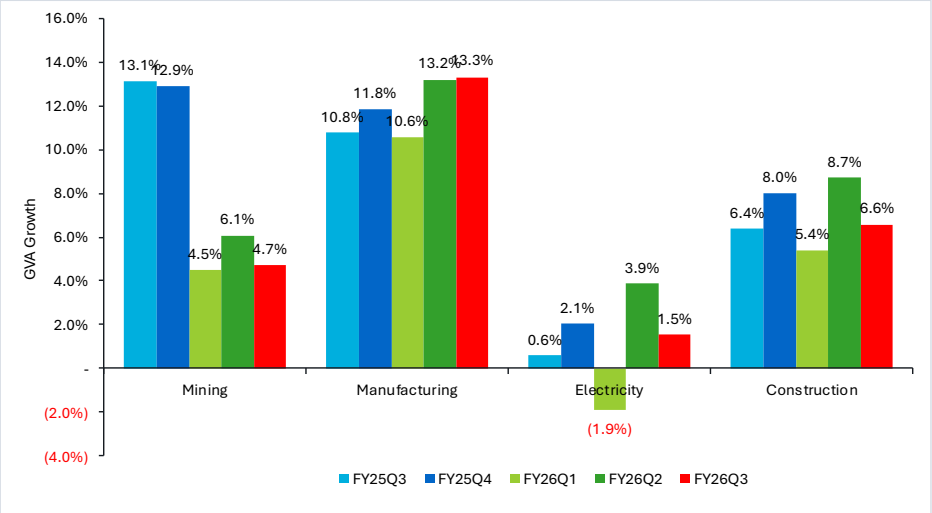
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.19 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.20 Over the period FY12-FY24, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same period. The economic growth of Uttar Pradesh (GSDP) has been slightly slower than the country overall. Uttar Pradesh's GSDP CAGR was 5.8% between FY12-24. Uttar Pradesh approximately contributes 8% to the India's GDP. In terms of per capita income, Uttar Pradesh's has lower per capita income than the country.

4.21 In terms of sectoral contribution to the state GDP, tertiary sector has the highest share (47%) followed by secondary (27%) and primary (24%), with the sectoral shares remaining stable over the last few years.

4.22 Uttar Pradesh is the most populous state in India with a population of ~237 million people. The state has a large pool of skilled, semi-skilled and unskilled labour. Uttar Pradesh is also considered the largest consumer base in the country. The tertiary sector has the highest sectoral contribution to the state GDP followed by the secondary and primary sectors. These shares have remained stable for the past decade.

4.23 The tourism and transport sector constitute a majority of the state's tertiary sector. Uttar Pradesh is considered a favoured tourist destination in India, with key tourist attractions being Agra, Varanasi, Mathura and Prayagraj. In 2023, the state contributed 16% share to national tourism pie which is second highest after Tamil Nadu9. The state holds third position in the country in foreign tourist arrivals with over 3.78 million[10]. Also, the state recorded a tourist footfall of 64.90 crore in 2024, a significant increase of over 17 crore from 2023 as per Union Ministry of Tourism[11]. Overall, Uttar Pradesh has 8.2% contribution to national GDP as per 2024 statistics.

Figure 4-7: Evolution of Uttar Pradesh's state GDP and national GDP

[11] up-sees-65-crore-tourists-in-2024-over-17-crore-more-from-2023

Source: Steer Analysis of MOSPI Data

4.24 In terms of secondary sector, the state has key industrial areas in Khurja (Ceramic); Moradabad (Metals); Meerut, Bareilly, Mirzapur and Lucknow (Handloom & Handicrafts); and Kanpur and Noida (Leather and tannery). The state also has an oil refinery in Mathura, operated by Indian Oil Corporation.

4.25 Uttar Pradesh has very fertile Gangetic land with a large share of population dependent upon agriculture sector for the livelihood. The key primary industries in the state include food processing, crop production and horticulture. The state is mainly known for production of wheat, sugarcane, potato and mango.

4.26 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI). The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[12], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP, and develop GSDP forecasts as a function of our assumed GDP forecasts[13].

4.27 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.28 Following the discussion in Chapter 2 on the nature of economic activity in the state of Uttar Pradesh, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth. Particularly, we have based our forecast on GSDP using forecasts of GDP as provided by the Client.

National GDP

4.29 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[14]

[12] **Consensus Economics - Economic Forecasts and Indicators**

[13] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

[14] **Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu** (September 2020)

4.30 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 and 6.5% in FY25.

4.31 Figure 4-8 below shows client provided GDP projections for India. The India GDP growth forecast provided by the Client is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[15] in the medium term.

Figure 4-8: GDP-GSDP forecast

[15] Survey of Professional Forecasters on Macroeconomic Indicators – Results of the 93rd Round (April 2025)

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this section, we present our approach, assumptions, and estimates for base year AADT and background traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 In the absence of Historical data on the Asset, the option of running statistical method to estimate background growth relationships was not available, therefore we have undertaken a detailed benchmarking exercise, coupled with trip length and OD analysis to estimate the elasticities. These are discussed in detail below.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilised information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

The base traffic for FY26 has been estimated using 11 months of actual traffic data (April to February). Each toll plaza's seasonality correction factors were applied on the actual MADTs of Apr-25 to Feb-26 to obtain seasonally corrected estimates for FY26 traffic. An average of these estimates was considered to be the FY26 base traffic.

Seasonal Correction Factors

5.6 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the

country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.7 To normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.8 Historical traffic data was available for all toll vehicle categories starting October 2020 up-to February 2026. Therefore, in absence of longer-term historical data for the Asset where FY21 and FY22 are COVID-19 impacted years, we assume FY23 onwards to be normal years, thus average FY23 to FY25 seasonality is considered for FY26 base year estimation for all the vehicle categories except for MAVs. For MAVs average FY23-FY24 SCF are used due to impacted traffic in Feb'25 and Mar'25.

5.9 Table 5-1 and Table 5-2 below present the average FY23-FY25 SCF used to estimate the AADT for both the toll plazas (in the case of MAVs, FY23 and FY24 SCFs were used as FY25 was impacted):

Table 5-1 SCF values for JL TP1

Vehicle Category	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	1.03	0.98	1.00	1.08	1.04	1.11	1.02	0.95	0.94	1.01	0.90	1.00

3A	1,305	1,439	1,444	10.6%
MAV	1,865	1,838	1,844	(1.1%)
OSV	2	2	2	
Total	**7,595**	**8,062**	**8,097**	**6.6%**
PCUs	**17,877**	**18,888**	**18,971**	**6.0%**

Source: Steer analysis; FY25 actual full year, FY26YTD includes 11 months of FY26, FY26A is adopted base for FY26

5.11 As can be seen from Table 5-3 and Table 5-4 above, the PCU growth for FY26A compared to FY25 is ~6% on both plazas. This increase is mostly driven by 2A and LCV and reflects the recent rapid development of the 2A using the corridor. Demand produced by places like Nagpur, Hyderabad, Bangalore, and Chennai has been the key driver of growth on this corridor. The success of 2A and LCVs along the NH44 routes has contributed to their growth. Hence, increase of approximately ~12% has been observed in 2A vehicle traffic across both plazas, reflecting a broader trend along the corridor. Conversely, the MAV growth has remained subdued, primarily attributed to traffic shift to Delhi Mumbai Expressway and the NH-30.

Estimation of background elasticities

Overview

5.12 For brownfield Asset, where sufficient historical traffic evolution is available, it is common practice to use regression model analysis to determine the relationship, expressed as

elasticity, between traffic growth and key socioeconomic drivers. This relationship is then applied to assumptions of future socio-economic evolution to estimate future traffic growth.

5.13 As for the Asset under consideration, a historical trend was not available since the Asset started tolling by the client in Oct-2020 and both FY21 and FY22 have been affected by Covid19 related disruptions. Therefore, we undertook a benchmarking exercise in order to estimate our forecast elasticities, Sources used included historical vehicle wise traffic growth on the Asset, outputs from the analysis of the OD data (refer chapter 3 for Commodity and trip length analysis) collected on the toll plaza. We have also undertaken a regional benchmarking against Asset having similar traffic profiles, which give us reasonable confidence the relationships proposed.

5.14 In terms of selection of growth drivers for vehicle types, in general we have assumed state GSDP as the key driving factor for the passenger traffic given this traffic is generally driven by the local economies of the cities and state containing the Asset. The heavier commercial vehicles generally ply long-distance, and the underlying growth is governed by the general economies of several states or nation as whole.

5.15 Given the nascent stage of India's logistics sector, characterized by a highly fragmented trucking industry (95% of operators owning fewer than five trucks) and low car ownership rates (30-35 per 1000 people), the forecast elasticities are projected to remain constant throughout the concession period. This assumption is grounded in historical trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away.

5.16 Table 5-5 below presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5-5: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP Uttar Pradesh
Car		100%
LCV		100%
Bus		100%
2A	100%	
3A	100%	
MAV	100%	

Source: Steer Analysis

5.17 Further to developing estimates for FY25 AADT, the Asset has operational history between FY22 and FY25, proving us three years of traffic growth on the Asset. Table 5.6and Table 5.7 below summarise the volume growth across each of the vehicle categories. For this comparison we have normalised the FY22 AADT for COVID19 by adopting seasonally corrected H2FY22 as the FY22 normalised (FY22N).

Table 5.6: Passenger and Commercial growth with normalised FY22 – JL TP1

Vehicle type	FY22N	FY23	FY24	FY25	FY26A	FY22N-26 CAGR
CJV	2,872	3,040	3,157	3,353	3,688	6.5%

Vehicle type	FY22N	FY23	FY24	FY25	FY26A	FY22N-26 CAGR
LCV	220	236	253	311	336	11.1%
Bus	163	167	191	185	181	2.7%
2A	969	1,123	1,226	1,422	1,608	13.5%
3A	1,248	1,313	1,325	1,280	1,443	3.7%
MAV	1,611	1,761	1,818	2,010	1,941	4.8%
OSV	2	1	2	2	2	(3.2%)
Total	**7,085**	**7,641**	**7,971**	**8,563**	**9,199**	6.7%

Total	**6,335**	**6,811**	**7,068**	**7,595**	**8,097**	6.3%
PCUs	**14,711**	**15,975**	**16,586**	**17,882**	**18,971**	6.6%
Passenger	2,432	2,525	2,623	2,743	2,923	4.7%
Commercial	3,700	4,063	4,201	4,548	4,845	7.0%

Source: Steer Analysis; Note; Passenger includes CJV and LCV traffic whereas Commercial includes LCV/2A/3A/MAV traffic

5.18 Babina toll plaza has grown at a CAGR of 6.3% from FY22N to FY26 at the PCU level, whereas Vigakhet has grown at 6.6%. Passenger traffic, which includes CJV and buses, is projected based on the state's GSDP, as the growth is driven by the regional local economy. Meanwhile, commercial traffic (2A/3A/MAV) is growing in relation to GDP, as the Asset lies on the NH44 corridor, which primarily facilitates north-south movement between Delhi and north and Chennai and south. Any growth observed on the Asset is influenced by regions along this north-south route.

5.19 The sections below detail out the reasoning for selection of respective growth driver(s) for each vehicle category.

5.20 It must be understood that, in recent historical traffic performance across national highway corridors, a notable trend has emerged: there is a discernible shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets FY24 and FY25 performance as well. Consequent of these evolving axle preferences, it has been assumed that the relationship between 3As

and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

Table 5-8: Elasticity recommendations for the Asset (both sections)

Vehicle Category	Proposed	Growth Driver	Comments
CJV	1.0	Uttar Pradesh GSDP	CJV traffic is predominantly catering to the local demand of towns of Jhansi and Lalitpur. Generally, we would expect that in fast-growing economies, car traffic growth rates are in line with growth in GSDP/GDP i.e., suggesting elasticities at or just above 1.0.
Mini LCV	0.6	Uttar Pradesh GSDP	Mini LCV traffic is predominantly catering to the local demand of towns of Jhansi and Lalitpur. Historical growth observed is similar to LCVs on all plazas hence the same elasticity is assumed as LCVs.
Buses	0.4	Uttar Pradesh GSDP	Buses tend to grow as the intercity connections improves. With Uttar Pradesh being a large state, buses tend to play an important role linking key cities in the state. A large majority of trips are within 100-300 km.
LCV	0.5	Uttar Pradesh GSDP	As discussed in chapter 3, the trip lengths of LCV and 2A category (up to 72%) are predominantly long-distance trips. The origins and destinations are similar to those of 3A and MAVs on the Asset. These trucks are special trucks which carry commodities such as courier/parcel, and automobile and ancillary parts as well. In addition to long distance movement, they also made short distance local trips feeding into the local demand generated by the cities nearby. Therefore, considering the above observations, and our experience across other toll roads in the region, we believe that elasticities of 0.5 for LCV with respect to state GSDP are considered reasonable.
2A	0.9 tapered to 0.8 by FY35	GDP India	2A/3A/MAV are primarily long-distance traffic carrying a healthy mix of commodities. Agriculture products and groceries are the key commodities moving on the Asset. However, this Asset is becoming a key link between Delhi, Nagpur, Bangalore and Chennai forming part of the strategic NH7/44 corridor. Trip lengths for almost 55% of the MAV are more than 1000km, signifying long distance nature of the traffic. Therefore, a relation of 1 to GDP is considered reasonable for MAV. We believe 3A to grow slower as compared to MAV as there is an increasing preference to use MAVs for long-distance movements.
3A	0.3	GDP India	
MAV	1.0	GDP India

6 Forecast: Network overlays and forecasts

Introduction

6.1 Following the discussion on our forecast of background growth rates in the previous chapter, this chapter first covers the potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in earlier Chapters, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

Impact of Indore Hyderabad Economic Corridor (IHE) and Solapur-Chennai on Delhi- Chennai traffic

6.3 With the construction of the Akkalkot-Chennai section of the Nashik-Chennai expressway and the development of the Indore-Hyderabad economic corridor, traffic between Delhi-Chennai that is passing through the Asset currently, would have two viable alternatives.

6.4 The Akkalkot to Chennai section of the Nashik-Chennai expressway is expected to get completed by FY29. Therefore, traffic coming from north/north-west of Solapur and heading towards Chennai will find this to be a viable route.

6.5 Another route choice that has emerged is the Indore Hyderabad economic corridor which is undergoing 4-laning between Indore and Muktainagar. This is expected to get completed by FY27 following which an additional alternate route will be available for traffic between north India and Chennai.

Figure 6.1: Alternate Route via Delhi Mumbai Expressway and Surat Solapur Chennai

Source: Steer Cartography

6.6 The existing alignment between Indore and Hyderabad is currently being upgraded to 4 lanes throughout. Once the widening of the existing alignment is completed, the route via Indore, Khandwa, Muktainagar, Akola, Nanded will provide an alternate route traveling between Madhya Pradesh/ North and Hyderabad/South. An alternate route of this mentioned OD pairs already exists via NH52. The widening of the section will improve the LOS of the existing alternate route.

6.7 There are currently two key options for north south traffic movement between Delhi/north and Chennai via:

- using NH19/NH44 via Delhi-Agra-Gwalior-Sagar-Nagpur-Hyderabad-asset-Kurnool-Karnataka/Chennai
- using NE4/NH52/SCE via Delhi-Lalsot-Indore-Dhule-Aurangabad-Solapur-Kurnool-Karnataka/Chennai.
- using NH46/NH52 via Delhi-Gwalior-Indore and the IHE via Indore-Muktainagar-Nanded-Hyderabad-Chennai

6.8 Currently, the traffic is using NH44 corridor as it is cheaper and shorter for north-south travel. The proposed upgrades on NH52 coupled with upcoming Delhi-Mumbai Expressway (DME) and Surat-Solapur-Chennai Expressway (SCE) will improve the alternate route's overall attractiveness as long-distance corridor for traffic moving north and south. For this expressway 2 out of 13 packages have been awarded and rest are under bidding[16].

6.9 The users travelling from Delhi/north to Kurnool/south will have the option to divert to DME at Delhi instead of taking NH44/NH52. The users can then exit from DME at Indore where they can travel till Solapur on an upgraded 4-lane highway (NH52). At Solapur, the users can divert on the upcoming SCE to reach Chennai. Hence, the route via DME-NH52-SCE, which will be a mix of expressways and upgraded NH, will act as a competing route for the Asset.

6.10 The In-scope trips considered include movements between

- Delhi and north India including states of Haryana, Punjab, and
- parts of Tamil Nadu such as Chennai and Puducherry.

6.11 The benefits will also be most valued by long distance users which can make end to end movements as compared to those users with intermittent destinations. Given the novelty of the expressway and its expected impacts on a fragmented logistics market, we have assumed that 40% of impact will be realised within the first year of its completion whereas the 100% will occur in FY29 when the SCE becomes operationalised.

Table 6-1: Impact of IHE and SCE for TP1

Vehicle category	FY27	FY28	FY29 onwards
Staging	*40%*	*60%*	*100%*
2A	(3.4%)	(5.1%)	(8.5%)
3A	(4.8%)	(7.3%)	(12.1%)
MAV	(2.4%)	(3.5%)	(5.9%)

Source: Steer analysis, impact will be applicable in a phased manner from FY27.

Table 6-2: Impact of IHE and SCE for TP2

Vehicle category	FY27	FY28	FY29 onwards
Staging	*40%*	*60%*	*100%*
2A	(3.5%)	(5.3%)	(8.8%)
3A	(4.8%)	(7.3%)	(12.1%)
MAV	(2.5%)	(3.7%)	(6.2%)

Source: Steer analysis, impact will be applicable in a phased manner from FY27.

6.12 We expect such shifts to take place over course of time once the benefits of the expressway are fully visible and could be influenced by three factors:

- the last and first mile connectivity; and

[16] https://infrainfohub.com/surat-chennai-expressway-route-map-cost-progress-and-latest-updates/

- roadside facilities typically seen along the national highway network such as truck stops, rest/refresh areas, affordable food/drink facilities; and
- fuel and repair shops coming up along the expressway network.

Revenue forecasting assumptions

6.13 To forecast the revenues for a particular financial year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e., traffic (total trips) to tickets sold, "toll segmentation" provides the latter i.e., the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Toll segmentation

6.14 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles. To access the document, refer to the following link.

6.15 Across multiple assets, the share of annual pass trips has been rising on a monthly basis since August 5. A corresponding decline in other ticket categories including Single and Return journeys has been observed.

6.16 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and post-annual pass segmentation from 15th August 2025 till 28th February 2026. The share of annual pass trips in March 2026 has been assumed to be the same as the share of annual pass trips in the last 10 days of February 2026.

6.17 The segmentation for CJVs in FY27 has been assumed to be the same as the estimated March 2026 segmentation as trends suggest that the share of annual pass trips have stabilised.For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Feb) as discussed in the earlier sections, can be considered a normal period.

Table 6-3: Segmentation for forecast years, TP1 Babina

Ticket type	CJV FY26	CJV FY27	Mini LCV	Bus	LCV	2A	3A	MAV
Single	22%	17%	28.5%	36%	88%	92%	96%	87%

6.18 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.5 presents the Annual pass compensation computed for the toll plaza.

Table 6.5: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY28	FY33	FY38	FY43	FY51
Babina	2.3	5.5	9.2	15.1	24.9	53.2
Vigakhet	1.2	2.9	4.7	7.8	12.9	27.5

6.19 Source: Steer Analysis

Trip factors

6.20 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest data available and listed in the tables below:

Table 6-6: Trip factors at TP1 Babina

Forecast	CJV/Mini LCV	LCV	Bus	2A	3A	MAV
Single	1	1	1	1	1	1
Return	2	2	2	2	2	2
Monthly	45	45	7	45	45	50
Local commercial/Annual Pass	1	1	1	1	1	1

Toll evolution

6.21 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.22 We have used actual toll rates from the FY25 toll notifications and FY26 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in the table below. These forecasts provided by the Client expect the Indian WPI to grow at an average of 4.0% between FY25-FY51. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client.

Table 6-8: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	0.96%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: Client inputs used for WPI FY28 onwards.

Revenue reconciliation

6.23 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a monthly level for the Asset. To reconcile we have used the FY26YTD (April 2025 to January 2026) segmentation, FY26YTD AADT and compared it with the reported revenue at the AADC (Annual Average Daily Collection) for the year. The exercise was undertaken at an annual level. The comparison, as shown in Table 6-9 and Table 6-10 below, depicts the modelled revenue vs the reported revenue difference, and the difference lies within 0.5% for both, this gives us the confidence in the assumptions around segmentation and trip factors for future forecast purposes.

Table 6-9: Revenue reconciliation summary TP Babina at AADC level (INR lakhs)

Modelled	Reported	Delta
28.61	28.62	(0.01%)

Target revenues and modification of concession period

6.26 As per the concession agreement, the target revenue for TP1 and TP2 should be 7.9 Cr and 5.3 Cr for the month of March 2030 first calculation of target revenue and 18.9Cr and 12.8Cr for the month of March 2040 for the second calculation of target revenue. The traffic sampling will be undertaken for a continuous period of 7 days during anytime within 15 days prior to the date on the specified year, previous year and following year. The average thereof will be deemed as 'actual revenue.' If the target revenue for any section falls short or exceeds by 2.5%, the concession period shall be deemed to be modified using the laid-out conditions in the concession agreement. Table 6.19 and Table 6.20 below presents the summary of the analysis.

Table 6.19: Target Revenues for Extension 1

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2029	2030	2031		
JL TP1	Mar-30	7.87	11.98	13.20	14.45	13.21	67.9%
JL TP2	Mar-30	5.28	8.33	9.13	10.02	9.16	73.5%

Table 6.20: Target Revenues for Extension 2

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2039	2040	2041		
JL TP1	Mar-40	18.89	30.04	32.91	36.04	33.00	74.7%
JL TP2	Mar-40	12.81	20.68	22.71	24.78	22.72	77.4%

Source: Steer analysis

6.27 We have used the average AADT forecast for target year, previous year and following year as a proxy for 'actual traffic.' We have forecast seasonality of March month to adjust for seasonal trends and arrive at March traffic from AADT traffic, which is then segmented according to the forecast toll segmentation and trip factors and multiplied with respective estimated toll rates to get to a monthly revenue collection.

6.28 As seen from the tables above, the difference between actual and targeted revenue lies above the permitted 2.5% excess, a renegotiation of the length of the concession agreement is expected. As per the concession agreement, for every 1% excess target revenue, the concession period shall be decreased by 1.5%, with a capping at 20%. Therefore, for the excess traffic on these toll plazas, the concession period, originally 30 years, is expected to be decreased by 5 years from FY51, potentially reducing the last date of concession to FY45.

Upside and Downside cases

Upside and Downside scenario assumptions

6.29 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.30 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.31 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.21: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.32 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.33 The upside case impacts included in forecasts are summarised in below.

Table 6.22: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP Babina	TP Vigakhet
Impact of IHE and Surat Solapur Chennai on Delhi- Chennai traffic	FY27*- 40%, FY28 – 60% FY29 – 100%	+25% of base case	2A: (6.4%) 3A: (9.1%) MAV: (4.4%)	2A: (6.6%) 3A: (9.1%) MAV: (4.6%)

Source: Steer analysis; *Same as the base case timeline

Impacts-Downside Case

6.34 The downside case impacts included in forecasts are summarised in below.

Table 6.23: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP Babina	TP Vigakhet
Impact of IHE and Surat Solapur Chennai on Delhi-Chennai traffic	FY27*- 40%, FY28 – 60% FY29 – 100%	- 25% of base case	2A: (10.6%) 3A: (15.1%) MAV: (7.3%)	2A: (11.0%) 3A: (15.1%) MAV: (7.7%)

Source: Steer analysis; *Same as the base case timeline

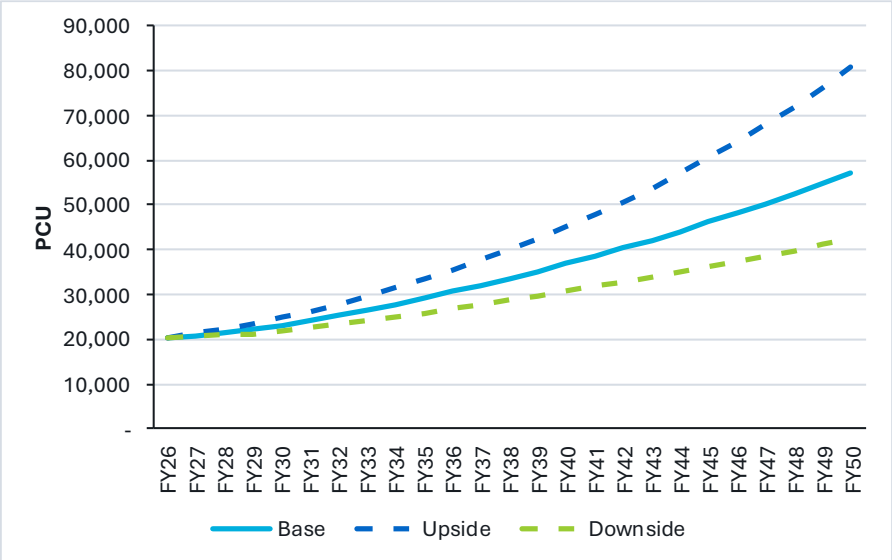
6.35 Based on the above assumptions for upside and downside scenarios, the following table summarizes the upside potential and downside risks associated with the PCU and the revenue for Babina and Vighkhet toll plazas at the end of the concession i.e. FY51.

Table 6.24: Upside potential and Downside PCU scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Babina	42.9%	(27.0%)
Vighakhet	42.7%	(26.9%)

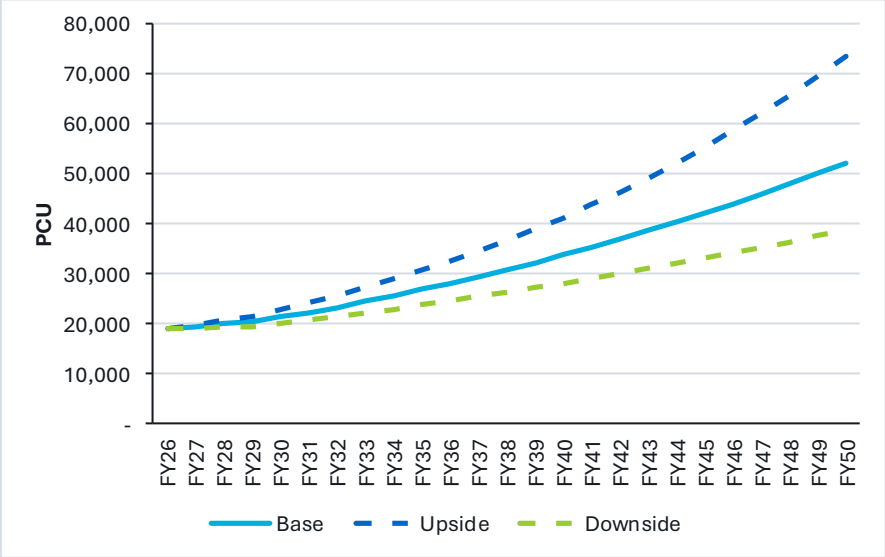
Source: Steer Analysis

Figure 6.2: Long-term PCU forecasts for Babina TP including upside and downside scenarios



Source: Steer Analaysis

Figure 6.3: Long-term PCU forecasts for Vigakhet TP including upside and downside scenarios



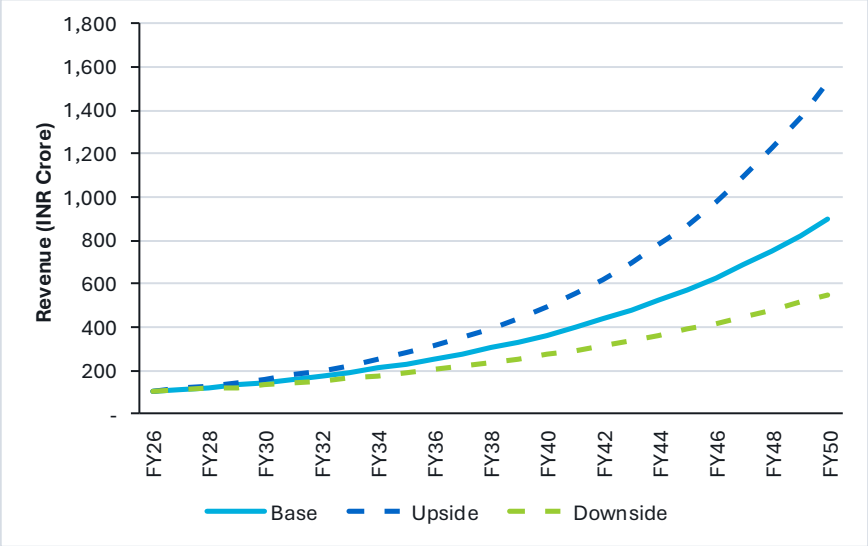
Source: Steer Analaysis

Table 6.25: Upside potential and Downside Revenue scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Babina	75.3%	(39.9%)
Vighakhet	74.9%	(65.6%)

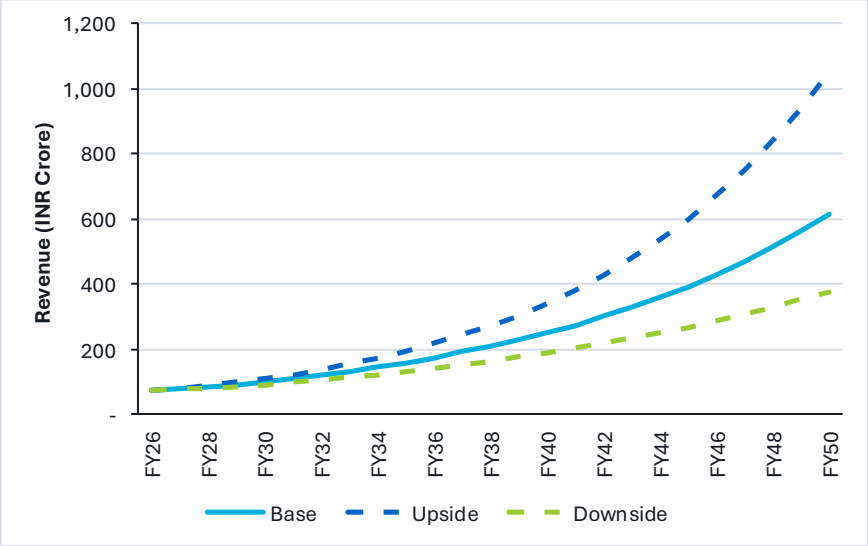
Source: Steer Analysis

Figure 6.4: Long-term revenue forecasts for Babina TP including upside and downside scenarios



Source: Steer Analaysis

Figure 6.4: Long-term revenue forecasts for Vigakhet TP including upside and downside scenarios



Source: Steer Analaysis

6.36 Revenue projections exhibit variability in both the upside and downside cases, driven by fluctuations in macro-economic factors such as WPI, GDP/GSDP, elasticities and the network impacts.

Summary outlook

6.37 Passenger movement on the Asset is largely local in nature, connecting the cities of Jhansi to Lalitpur over the short distance and northern cities of Kanpur and Lucknow to Sagar and Nagpur. Cars are expected to see a healthy growth on the Asset following the overall growth in income level and growth in the economy.

6.38 The biggest advantage for this Asset lies in its geographic location and strategic context, connecting the key movement between north India to the southern states of Madhya Pradesh, Karnataka, Telangana and Tamil Nadu. The overall network has been recently upgraded and provides a seamless connectivity for users. This is also demonstrated by the fact that almost 80% of truck users on this Asset cover distances of more than 500km.

6.39 Delhi Mumbai Expressway and Solapur Chennai Expressway is a key risk that has been identified which will impact the traffic on the corridor. As discussed in this chapter, a phased approach is taken to access the impact of DME, with 50% of estimated traffic loss in the first year of operation and the complete impact in the subsequent years.

6.40 Overall, we see a positive outlook for the region and the Asset, given that it caters to long distance movement to/from Chennai, Bangalore, Hyderabad etc to Delhi NCR. The underlying growth drivers of the corridor are strong and are expected to deliver long term sustained growth.

6.41 Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by Client, feedback from Client meetings and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarised below.

Appendices

A. Top 10 OD Pairs

6.42 Further to the OD analysis presented in Chapter 3, this appendix presents the top 10 OD pairs at each toll plaza. The tables below showcase data for both CJVs as well as MAVs and OSVs combined.

TP1 Babina

Table A.1: CJV top 10 OD pair shares at TP1 Babina

	OD Pair	Share
1.	Lalitpur-Karera	29%
2.	Lalitpur-Babina	10%
3.	Talbehat-Karera	10%
4.	Talbehat-Babina	5%
5.	Lalitpur-Kanpur nagar	3%
6.	Karera-Sagar	3%
7.	Babina-Betul	2%
8.	Kanpur nagar-Indore	2%
9.	Lalitpur-NCT of Delhi	1%
10.	Karera-Betul	1%

B. Data collection exercise

6.43 In order to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

3/7-day TVC counts

Table B.1: TVC counts at TP1

Date	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total
29-01-2024	2,963	665	366	146	1,117	1,147	1,741	4	8,149

C. Detailed forecasts

6.44 Further to the summary of forecasts presented in Chapter 6, this appendix presents detailed forecasts.

Traffic forecasts

6.45 This section presents the detailed traffic forecasts for the forecast period until FY51, year of expected close of the concession. The following two tables show the traffic growth rates and AADT, respectively.

Table C.1: Forecasts for (background + impacts) traffic – TP1 Babina

	CJV	Mini LCV	Bus	LCV	2A	3A	MAV	OSV	Total	PCU
FY27	**3,185**	**672**	**186**	**347**	**1,642**	**1,399**	**2,019**	**2**	**9,451**	**20,872**

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pte. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data. Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason. While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through February 2026. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Jaipur Mahua Toll Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 11 project". This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to February 2026 and latest macro-economic, and network assumptions.

1.2 The Asset Jaipur-Mahua consists of a single stretch of toll road with two toll plazas. For the purpose of this report, we hereafter call the toll plazas present on the Asset as TP1 and TP2 respectively.

- TP1 – Sikandra
- TP2 – Rajadhok

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Origin-Destination (OD) data, Vendor reports and documents	• Provided by client for the period between April 2009 and March 2026 for TP1 and September 2010 and March 2026 in case of TP2, with FY26 base AADT and forecasts considering data up to Feb'26
• Historical analysis and forecasts for baseline growth, including; — Background growth, — Seasonality	• Historical toll plaza data provided by Client
• Validation of Revenue reported in FY26YTD	• TMS data provided by Client. • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue.
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by Steer on Rajadhok in Feb'26 and on Sikandra in June 2023 under previous study.
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by

Scope of work	Data source
	Steer based on Generalised Journey Cost spreadsheet-based analysis
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research and Steer's in-house experience of working in the vicinity of the Asset
• Toll revenue estimation for the entire concession including toll evolution	• Toll evolution based on toll notification published by National Highway Authority of India (NHAI); and Gross Domestic Product (GDP) & Wholesale Price Index (WPI) trends as shared by the client

Our approach

1.4 The approach employed by Steer in the preparation of these forecasts was developed to take advantage of existing knowledge of the Asset and available data from various sources made available by the Client as well as publicly sourced. It follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset.

1.5 The analysis focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.6 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting from FY09 up to February 2026. The historical traffic and revenue presented in Chapter 3 considers information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous studies related to traffic and revenue
  - Steer-commissioned OD surveys on the two plazas of the Asset to validate any change in growth drivers and travel patterns. The latest survey on TP1 was conducted on 26th June 2023 and on TP2 on 17th Feb'26.
  - Steer-commissioned a 4-day TVC counts on TP1 Sikandra from 26th June to 29th June 2023 in the previous study in 2023 and a 3-day TVC counts on TP2 Rajadhok from 17th Feb'26 to 19th Feb'26.
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by each of the toll plaza and subsequently match it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the

segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.7 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position by applying seasonality correction factors (SCFs) on the 11 months of actual traffic data available (April to February).
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms; axle shift for heavy goods.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.8 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of the corridor and region/state containing the Asset, along with our approach and results on estimating background traffic demand growth; and
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases.

2 The Asset

Introduction

2.1 This chapter provides a description of the Asset, based on concession agreement, site observations, our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Rajasthan, connecting the state capital Jaipur to Mahua on the east, near the border of Rajasthan with Uttar Pradesh (UP). The Asset carries considerable passenger volumes between the three nodes of India's Golden Triangle - Delhi, Jaipur and Agra engaged in tourism and related activities. Figure 2.1 shows the regional road network in which the Asset is located.

Figure 2.1: Asset location in the regional network context

Source: Steer cartography using OpenStreetMap data

2.3 This Asset primarily caters to three types of strategic movements:

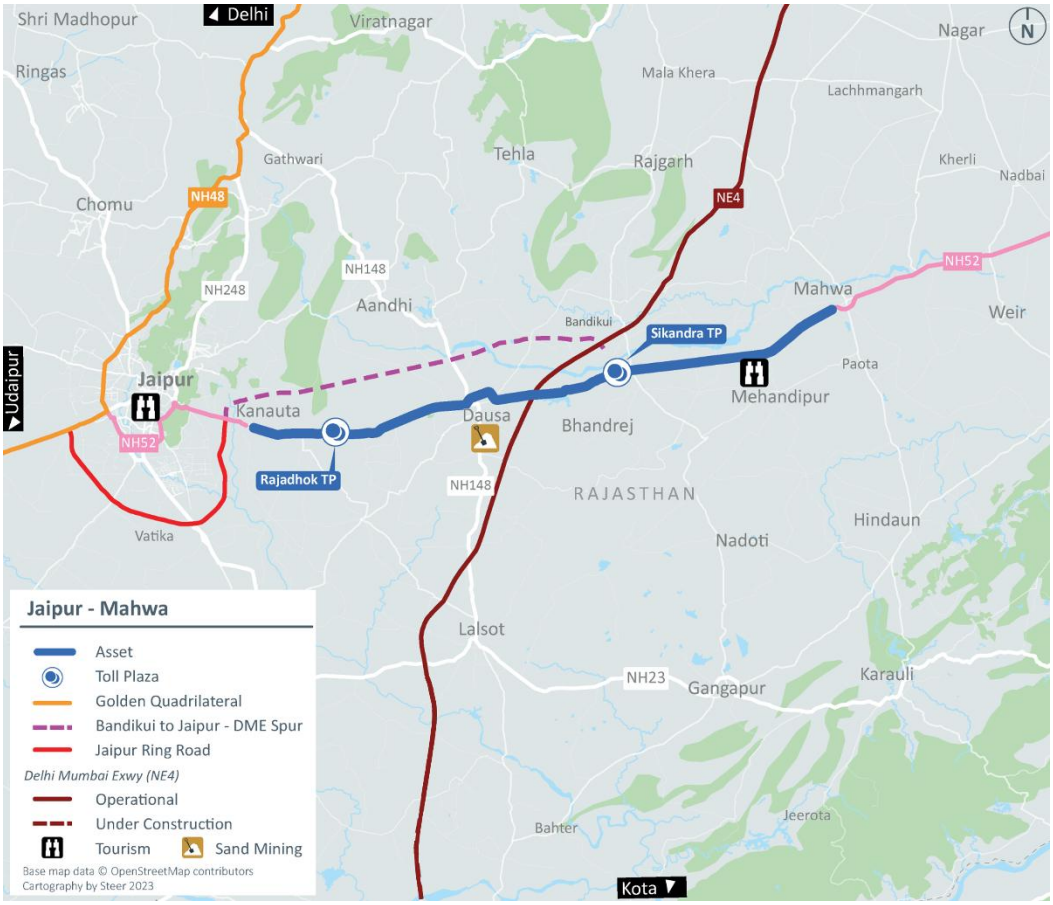
Short-distance trips including tourism and leisure trips between some of the key tourist destinations in India. Such trips are mostly comprising of CJVs which are either local or run between key tourist locations of Agra and Bharatpur at one end and Jaipur on the other.

Medium-distance trips between Rajasthan and Uttar Pradesh connect marble and sandstone processing sites of Rajasthan to its consumption sites in Uttar Pradesh. The Asset also transports significant number of manufactured products across the states of UP and Rajasthan.

Long-distance trips between Gujarat and southern Rajasthan, and UP/East India connects ports and industries of western India to major consumption and production centres in North India.

2.4 The Asset is a 109.09-km toll road which forms a part of the NH 21 (Jaipur – Agra – Bareilly) in Rajasthan and Uttar Pradesh. It is a four-lane Asset with two toll plazas, namely, Sikandra (TP1) at Km 156.6 (closer to Mahua) and Rajadhok (TP2) at Km 204.7 (closer to Jaipur). Figure 2.2 provides a closer view of the Asset in the context of its immediate surroundings and location of toll plazas.

Figure 2.2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.5 The toll plazas on the Asset have been operational since April (TP1) and September (TP2) 2009 and the Client took over its operations in May 2015. There are 6 years left in the concession period which ends in FY32. Table 2.1 table presents a summary of the concession.

Table 2.1: Summary of concession

Particulars	Details
State	Rajasthan
Highway and lane configuration	NH 21 four lane
Toll plazas	• TP1: Sikandra • TP2: Rajadhok
Length (km) as per concession agreement, applicable	• TP1: 54.73 km • TP2: 54.36 km
Commencement of operations	• TP1: April 2009 • TP2: September 2009
Operated by Client since	May 2015
Concession period	25 years
Last year of concession	FY32

Source: Client data

2.6 The figure below shows a typical cross-section of the Asset and its toll plazas.

Figure 2.3: Toll plazas on the Asset

Source: Steer site visit

2.7 The tolls on the Asset are collected for following vehicle categories with rates as shown in Table 2.2. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling.

Table 2.2: Single toll rates on the Asset (INR), applicable in FY26

Type of Vehicle	Single Journey Fee	
	TP1 Sikandra	TP2 Rajadhok
CJV	80	80
LCV	140	140
Bus/Truck	285	280
3A/MAV	455	450
HCM/EME/OSV	455	450

Source: NHAI Revision of User fee Rate w.e.f 01.07.2025

2.8 The Asset currently issues tickets including single, local commercial, monthly, and local personal under NHAI concession. There are no return tickets issued on either of the two toll plazas, but TP2 Rajadhok plaza issues local passes. The local personal ticket category is a discounted single-entry pass issued to trips originating within 10kms of the Asset. Whereas local commercial is another single-entry discounted pass issued at the Asset Plaza to commercial vehicles registered within the Asset district. Further, detailed information on this have been provided in Chapter 3 of the report.

Key economic activities

2.9 Rajasthan is the largest state in India by area, sharing borders with five major states- Uttar Pradesh, Haryana, Punjab, Madhya Pradesh and Gujarat. It is rich in natural resources particularly minerals and produces about 57 different minerals.[1] Predominantly an agrarian economy and a major producer of grains, oilseeds and edible oil, the recent

[1] http://www.mines.rajasthan.gov.in/dmgcms/page?menuName=YzCjPSj/AU7RGgRfpUoY5A==#:~:text=Rajasthan%20is%20the%20richest%20state,zinc%20ores%2C%20selenite%20and%20wollastonite.

times has seen a high rise in the service sector growth wherein the sector contributed to 45% to state's GSDP in 2024-25 followed by agriculture at 30% and industries at 25%.[2]

Urban centres, business and tourism

2.10 The state of Rajasthan and its bordering cities in UP (e.g. Agra and Mathura) are known for their tourist destinations. This contributes significantly to high passenger traffic volumes both within cities and on highways. The Bharatpur area with the Keoladeo Ghana National Park is a major attraction for tourists, known for its birds. The capital city of Jaipur, located on one end of the Asset, is a thriving urban city which is the main centre of administration, governance, culture, education, business, and service sector in the state. It is a prominent tourism destination contributing majorly to the flourishing hospitality industry in the state. This reflects in considerable passenger volumes between the three nodes of India's Golden Triangle - Delhi, Jaipur and Agra – observed on the Asset engaged in tourism and related activities. In recent times, the city has also emerged as a promising hub for global outsourcing and IT industry. Jaipur's strategic location on the golden quadrilateral connects it with major industrial, agricultural, and cultural centres of Chennai, Kolkata, Delhi, and Mumbai.

Marble, cement, and sand

2.11 The State is also a leading producer of Masonry stone with around 136.1 million tonnes of production in FY24.[3] Places like Kishangarh, Kota and Dausa produce stone and sand, apart from being a hub of major marble processing centres, with a history of supplying marble to the rest of India.

2.12 Rajasthan accounts for 70 per cent of the country's stone production. There are 4,920 mining leases in the state[4]. Rajasthan produces 90 percent of the marble and sandstone in the country. In terms of Granite, in FY24 Rajasthan produced more than 10.4 million tonnes compared to 9.3 million tonnes in FY23[5]. This is due to the increased export demand from countries like US, China and Europe.

2.13 Sandmining in India has long faced issues of corruption involving local mafias and a lack of proper implementation of mining policies by the government. In November FY18, when Supreme Court order ruled the requirement of environmental clearances for all sand mines, including those less than five hectares of size, there was a reported drop in traffic carrying construction-related commodities on the Asset, particularly sand. However, in 2020, following the implementation of the Major and Minor Mineral Policy, the mining industry in the state was regularized by imposing a ban on illegal mining activities. Additionally, sand mining leases were reduced to two years, with an improved replenishment cycle. The policy also mandated the use of 25% M-Sand (manufactured sand) as an alternative to riverbed sand for construction activities in Rajasthan.

2.14 After the policy implementation, the combination of reduced legalized sand mining, award of leases, and increasing demand for construction material for local activities led

[2]MoSPI data

[3]**Minor mineral production in Rajasthan**

[4] **70% of stone production in India comes from Rajasthan: RIICO Chairman (knnindia.co.in)**

[5] **Granite production in Rajasthan**

to a continued demand for sand and other construction materials in the region. In terms of lease tenure related to this commodity within the Rajasthan mining policy:

- Sand mining leases- 2 years (re-award of new leases after 2 years): Additionally, to reduce illegal mining and allow for the full replenishment cycle of rivers in the region, the state government has reduced the validity of sand mining leases from the existing five years to two years.
- Aggregate mining leases- 5 years (re-award of new leases after 5 years)

2.15 While the main sand mining policy came in 2020, a revised version is issued in 2024. in which the Rajasthan government introduced the Rajasthan Mineral Policy 2024 and the M-Sand Policy 2024 to address illegal mining and promote sustainable practices. To strengthen enforcement, 27 monitoring teams were deployed across the state. Therefore, there is no ban on sandmining/construction material mining; however illegal mining is prohibited.

Alternate Routes

2.16 For long-distance trips connecting Gujarat and southern Rajasthan to Uttar Pradesh and other eastward states, there is an alternative route along NH 27 that joins Udaipur and Kanpur via Chittorgarh-Kota-Jhansi. Majority of travel patterns are already well established and the choice between using NH27 vs. NH48 and the Asset for east-west movements has been established over a number of years. However, for a small proportion of traffic on NH27; the route via the Asset is expected to become more attractive as the key feeders of the Asset improve.

2.17 The Dausa-Lalsot corridor connects to the Asset between the two toll plazas. It acts as a feeder to the Asset. For medium-distance trips between southern Rajasthan and east of Dausa, there is an alternate road that bypasses TP2 Rajadhok through the Tonk-Lalsot-Dausa connection. This corridor is operational since 2021 with a positive impact of increasing traffic on Sikandra plaza of the Asset with a slight traffic dip on Rajadhok plaza. This traffic started appearing on the Asset in FY23 volumes and no further adjustments have been made to the traffics.

Delhi-Mumbai Expressway

2.18 The Delhi-Mumbai Expressway is a 1290-KM long greenfield expressway that is being developed to provide an improved 8-lane route to long-distance traffic between North India to Mumbai. The competing movements which may choose to take the DME are as follows:

1. Traffic originating near Lalsot destined to Alwar
   i. Vehicles making trips between Lalsot and Alwar, which earlier made the trip via Dausa – Sikandra – Mahwa – Laxmangarh – Alwar, now has an alternative available in the form of the DME which provides direct connectivity from Lalsot – Dausa – Alwar via NE4.
2. Traffic originating near Lalsot destined to Faridabad/North
   i. Trips originating near Lalsot destined to regions in Faridabad/north including Delhi, Ghaziabad, Gurugram, which earlier made the trip via Dausa – Sikandra – Bharatpur – Mathura via SH33 – Faridabad, will now have an alternative route available.

ii. The alternative route will materialise as a conjunction of the DME and the Faridabad bypass. It will provide connectivity from Dausa – NE4 – Faridabad bypass at Kaligaon.
iii. By virtue of the route being supplemented by the Faridabad bypass, traffic destined to Delhi and north will get access to smoother passage by being able to avoid entering the city altogether.
iv. In addition, the Bandikui spur provides an alternate to traffic between Jaipur and north India as well as east-west movement between Agra/Firozabad and Jaipur. Such trips can avoid Rajadhok toll plaza by entering Jaipur via the Bandikui spur.

2.19 A few sections of the greenfield expressway have been made operational with Sohna-Dausa-Lalsot section (Feb'23), Madhya Pradesh section (Sep'23), Vadodara-Bharuch section (Feb'24), Lalsot-Sawai-Madhopur section (Feb'24) and the Kota-Bundi Section (Dec'24) already being operationalised. Additionally, the Bandikui spur opened in August 2025 [6], leading to a traffic dropping on TP2 Rajadhok, since the spur acts as an effective alternate route for vehicles travelling to/from Jaipu, thereby bypassing the Delhi-Jaipur NH48 section to reach Jaipur directly

2.20 The potential shift of traffic that was expected on this stretch has already been witnessed on TP1 Sikandra in goods vehicles, due to the operationalisation of the initial sections. The NE4 in conjunction with the Faridabad bypass now provides a better alternative to vehicles moving between Lalsot, Jaipur, Faridabad, Delhi, Gurugram, etc. However, Sikandra has seen an increase in CJV volume due to the presence of famous temples near Sikandra, therefore CJV traffic from DME is crossing the Sikandra plaza to visit the popular pilgrimage destination Shri Khatu Shayam Temple and Mehendipur Balaji Temple.

2.21 In absence of an official update on the construction status of DME, based on the publicly available information, the section wise update on the Delhi Mumbai Expressway section is given below:

Table 2.3: Section Wise Delhi Mumbai Expressway status

S. No	Section	Length (in km)	Sub-Section	State	Status	Expected Data of Completion
1	Delhi-Faridabad-KMP	59	Faridabad-KMP	Delhi, Haryana	Operational	Opened Nov'24
2	Sohna-KMP-Vadodara	844	Sohna – Sawai Moadhopur	Haryana	Operational	Opened Sept'23
			Sawai-Madhopur-Jhalawar	Sawai-Madhopur-Jhalawar	Under Construction	Operational under trial on one side.
			Jhalawar-Timarwani	Jhalawar-Timarwani	Operational	Opened Sept'23

[6] Bandikui-Jaipur Expressway open to public, cuts Delhi-Jaipur travel time to 3 hours| India News

S. No	Section	Length (in km)	Sub-Section	State	Status	Expected Data of Completion
			Timarwani-Vadodara	Madhya Pradesh, Gujarat	Under Construction	Expected Dec 2026 (90% construction completed)[7]
3	Vadodara – Virar	354	Vadodara-Bharuch	Gujarat	Operational	Opened Feb'24
			Bharuch-Virar	Gujarat, Maharashtra	Under Construction	Expected in early 2028[8]
4	Virar- JNPT	92	Virar- JNPT	Maharashtra	Under Construction	Expected FY28
Spur Development						
5	Jaipur – Bandikui Expressway	67	Jaipur – Bandikui	Rajasthan	Operational	Operational since July 2025

2.22 No major micro-diversions through local roads were observed close to the toll plazas.

3 Traffic description

Introduction

3.1 This chapter outlines the historical and current traffic and revenues on the Asset, as well as our analysis of origin-destination (OD) data and traffic volume count (TVC) data. This includes data collected as a part of this study and previous studies of this Asset, as well as data provided by the Client.

3.2 Traffic data is generally collected and analysed to understand the volume and vehicle composition of traffic currently using the Asset, while OD data is used to obtain a better understanding of commodity movements, travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset as well as the commodities being moved by the goods vehicle. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is typically provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

3.4 The below sections present historical traffic and revenue information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.

PCU factors considered for reporting

3.5 The PCU values have been taken from 'IRC 64:1990- Guidelines for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts conducted in 2023 for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in the following sections.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
Mini LCV	1.0
LCV	1.5
Bus/2A/3A	3.0
MAV	4.15
OSV	4.5

Source: Steer analysis and IRC64,1990

Historical trends

3.6 The following table presents the historical variation in traffic volume at both the Asset plazas, in terms of total AADT, vehicle shares and yearly volume growth. TP1 Sikandra started operation in April FY10 while TP2 started September FY11. The table below shows the traffic evolution on TP1 and TP2 for recent years FY16-26YTD.

Table 3.2: Historical evolution in AADT by vehicle class at TP1 – Sikandra

Class	FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26	CAGR FY16-26

Source: Steer analysis of Client data; FY26 AADT represents the full year actual (April to March); tollable traffic excludes exemptions and violations

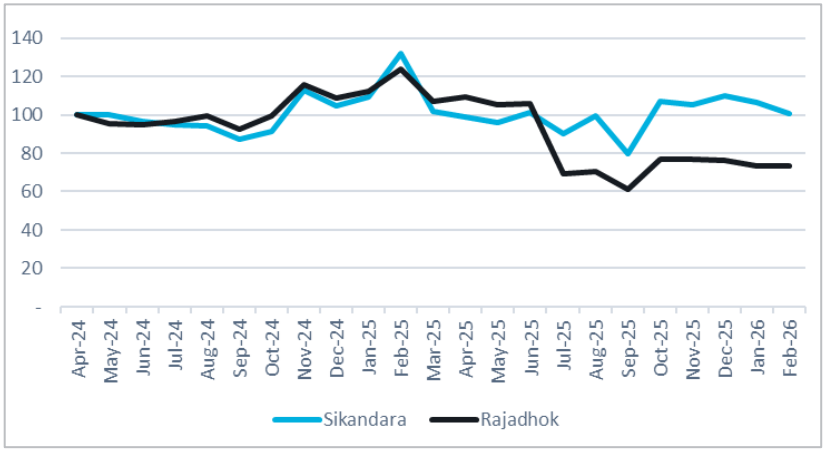
Figure 3.1: Passenger Traffic trends on the Asset in FY25 and FY26



Source: Steer analysis of Client data

3.7 In terms of vehicle composition, CJVs are biggest contributor on the Asset with a share of over 60% on TP1 and 70% on TP2, in FY26. Traffic growth on TP2 Rajadhok plaza of this Asset has been stronger than TP1 and is driven by the rapid car growth influenced by the urban characteristic of Jaipur which generates heavy daily passenger trips.

3.8 Additionally, there was a notable rise in car volumes during Jan'25, as seen in Figure 3.1 above, driven by increased travel to the 2025 Maha Kumbh Mela in Prayagraj [9]. As a result, passenger traffic on the Asset witnessed a substantial increase in pilgrim-related volumes during Jan 2025 on both toll plazas

3.9 At TP1 Sikandra, the 8.3% CAGR in tollable AADT for CJVs can be attributed to pilgrimage-related traffic to and from popular pilgrimage destinations such as Shri Khatu Shyam Temple and Mehandipur Balaji Temple.

3.10 Rajadhok, on the other hand, recorded a healthy growth across all vehicle categories between FY16 and FY25. However, in FY26, Rajadhok saw a 16.2% drop in traffic in PCU terms from FY25. This is attributable to the opening of the Bandikui spur. The spur provides an effective alternate route for traffic travelling between Jaipur and Delhi NCR via the DME and allows traffic to bypass TP2 completely.

3.11 Additionally, although 2A and Buses share the same toll rate, the current TMS reports them as separate categories. In contrast, 3A and MAV are combined into a single category. However, post FASTag implementation there has been a reclassification of Buses and 2As which are now tolled basis their vehicle mapping. To accurately assess the historical growth of these categories and adjust for any discrepancies due to this reclassification, we have combined the 2A and Bus categories for our analysis.

3.12 To further validate individual growth of each category (Bus/2A/3A/MAV), we conducted independent counts at various points in time to ensure the true representation of individual volumes for the asset. The results of the split are presented in the 'Key findings of the TVC data analysis' section of Chapter 3 of the report. Therefore, the split that we have derived from our counts is the split we are using in our projection to forecast the growth of each individual category for this Asset.

Historical Revenue

3.13 Table 3.6 presents the reported historical revenue of the Asset.

Table 3.6: Historical revenue collection (in INR crores) and AADC (in INR Lakh) :

		FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26	CAGR (FY16-26)
TP1	Total	66.1	64.0	78.7	74.2	79.1	77.3	94.9	109.0	114.0	120.5	127.9	-
	AADC	18.1	17.5	21.5	20.3	21.6	21.2	25.9	29.9	31.1	33.0	35.0	6.8%
TP2	Total	56.2	53.3	63.9	62.5	64.4	61.1	74.2	89.0	120.8	132.7	113.5	-
	AADC	15.4	14.6	17.5	17.1	17.6	16.7	20.3	24.4	33.0	36.3	31.1	7.3%

[9] **The Maha Kumbh Mela, held once every 144 years, is regarded as a once-in-a-lifetime spiritual event, significantly influencing regional traffic patterns.**

	FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26	CAGR (FY16-26)
Total(Cr)	122.4	117.3	142.5	136.7	143.5	138.4	169.0	198.0	234.8	253.2	241.4	7.0%

Source: Steer analysis of the Client data. FY26 represents full year actual (April to March).

3.14 The Asset has demonstrated a strong total revenue CAGR of 7.0% between FY16 and FY26. This growth can be attributed to various factors, including increased traffic volumes resulting from network enhancements including operationalisation of DME till Lalsot in Feb'23 which led to positive traffic increase. The gradual increase in revenue post-FY23 is due to post-pandemic recovery, as discussed earlier.

3.15 The opening of the Bandikui spur in August 2025, which allows traffic to bypass TP2 Rajadhok and directly enter Jaipur – led to a ~14.4% decrease in average daily collections (from INR 36.3 lakhs in FY25 to INR 31.1 lakhs in FY26).

Toll Frequencies

3.16 Table below shows the toll segmentation assumed for the period of forecast. The following are the types of tickets being sold at the plazas of the Asset.

Table 3.7: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Local Personal	Discounted single entry pass only for private cars of residents within 10km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.17 In addition to the above ticket categories, a special category pass of "Monthly" is also being sold on Rajadhok plaza the Asset for CJV and LCV vehicle category. Under this, the user is charged 1/3rd the fee of Single ticket applicable on the plaza for 50 allowed trips.

Traffic Segmentation

3.18 CJV segmentation observed on the Asset remained stable between FY20 and FY25, with the share of single trips observed to be in the range of 91%-94% for TP1 and 87%-92% for TP2. However, the introduction of annual passes for CJVs in August 2025 by the NHAI has led to the respective shares being 78% and 76% as of FY26YTD. The rapid adoption of the pass can be seen by the 17% and 16% shares observed at TP1 and TP2 respectively, over the same period.

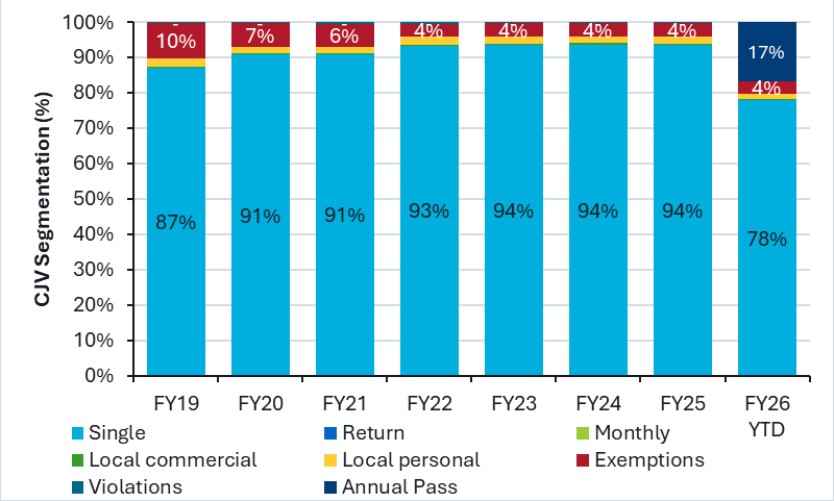
3.19 It is important to note that the Asset does not offer a return ticket option, which explains the disproportionately high proportion of single-ticket transactions in the toll segmentation. Furthermore, CJVs operating on the Asset typically undertake short- to medium-distance trips, generally within a 300 km radius, as reflected in the OD analysis (Figure 3.16 and Figure 3.17) below

3.20 It is also observed that for CJVs there has been a steady decline in the number of exemptions reported on the Asset starting FY16 towards FY26YTD from 10% to 4% at TP1

and 10% to 4% at TP2. This decline can be attributed to the local nature of the Asset and its proximity to the tourist city of Jaipur, which experiences heavy daily traffic movement.

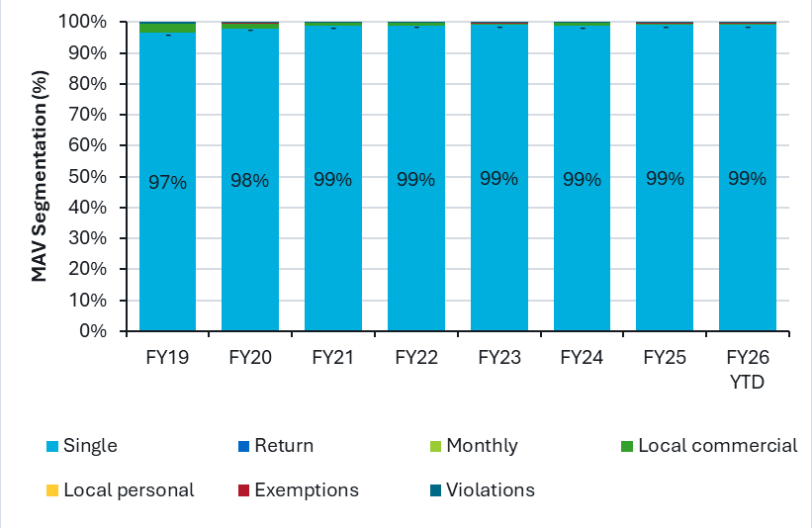
3.21 Figure 3.2 through Figure 3.5 below present the toll segmentation for the historical years FY19- FY26 YTD at TP1 Sikandra and TP2 Rajadhok for CJVs and MAVs. Table 3.8 through Table 3.13 below present the same for all other vehicle categories.

Figure 3.2 Ticket-segmentation for CJV at TP1 Sikandra



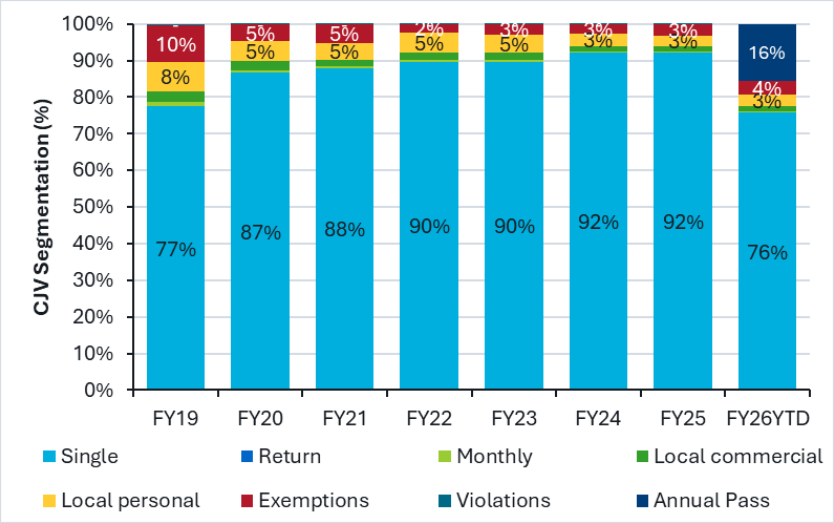
Source: Steer analysis of the Client data, FY26 YTD includes 11 months of data from Apr-Feb'26

Figure 3.3 Ticket-segmentation for MAV at TP1 Sikandra



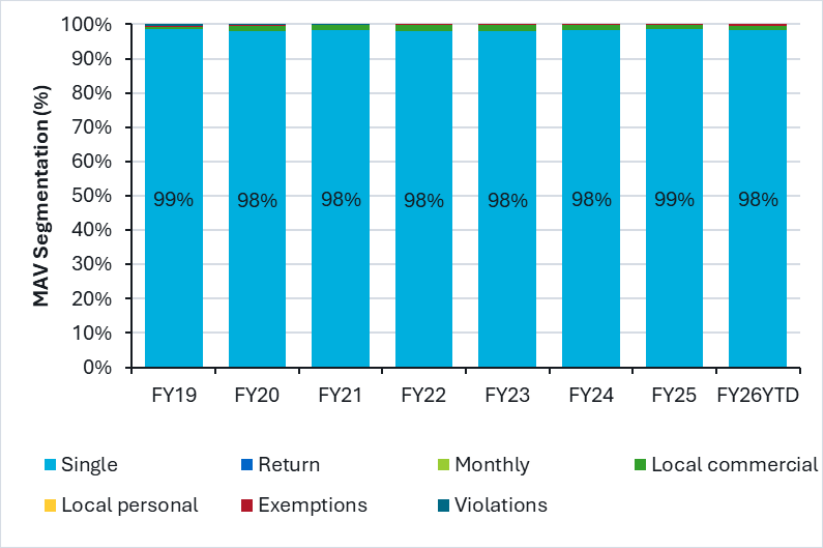
Source: Steer analysis of the Client data, FY26 YTD includes 11 months of data from Apr-Feb'25

Figure 3.4 Ticket-segmentation for CJV at TP2 Rajadhok



Source: Steer analysis of the Client data, FY26 YTD includes 11 months of data from Apr-Feb'26

Figure 3.5: Ticket-segmentation for MAV at TP2 Rajadhok



Source: Steer analysis of the Client data, FY26 YTD includes 5 months of data from Apr-Feb'26

3.22 Most MAVs at both TP1 and TP2 are observed to have high shares of single tickets with the share of MAVs buying single tickets, reaching as high as 99% at TP1 and 98% at TP2 in FY26YTD in line with previous years. This reflects the long-distance and through nature of heavy truck movement on the Asset. The high share of single ticket type is due to other tickets such as return and monthly being not available as per the toll notification. As expected, there is a negligible share of violations for MAVs.

Table 3.8: Historical ticket segmentation at TP1 Sikandra (LCVs)

	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26YTD

Overloading

3.23 The Asset being a part of NHAI concession follows the NHAI Overloading policy released in 2016 which bans the overloading of commercial vehicle on any NHAI toll plaza. In case of non-compliance, overloaded vehicles on the Asset are charged twice the toll fee they would otherwise pay for a Single ticket at the toll plaza.

3.24 The plaza currently charges overloading under single and local commercial category. These shares are determined using the total single journey traffic and total local commercial traffic. Table 3.14 shows the share of overloaded vehicles until FY25YTD paying twice the Single journey toll fee on each toll plaza.

Data collection and validation

Overview

3.25 As mentioned previously, in order to validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset, comprising the surveys listed in Table 3.15 below. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.15: Data collection schedule

TP	4-day videography-based TVC			1-day OD survey	
	Start date	End date	Time (hrs)	Start date	State time

TP	4-day videography-based TVC			1-day OD survey	
TP1 Sikandra	26th June 2023	29th June 2023	0000-2359	26th June 2023	0800 hours
TP2 Rajadhok	17th February 2026	19th February 2026	0000-2359	17th February 2026	0800 hours

Source: Steer analysis

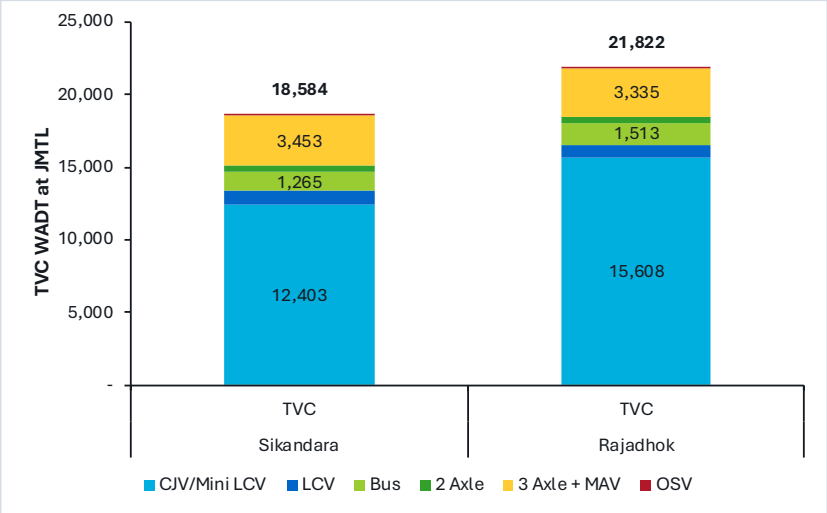
3.26 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, in order to fully understand the impact of this weekly fluctuation on the Asset, we collected four-day counts at each toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.27 Taking an average of the three-day TVC counts (26th June – 29th June 2023, 0000-2359 hours) at TP1 and at TP2 (17th Feb – 19th Feb 2026, 0000-2359 hours), we obtained the following weekly average daily traffic (WADT) for each toll plaza. This WADT excludes non-toll able vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Figure 3.6 WADT at TP1 and TP2



Source: Steer analysis of TVC data

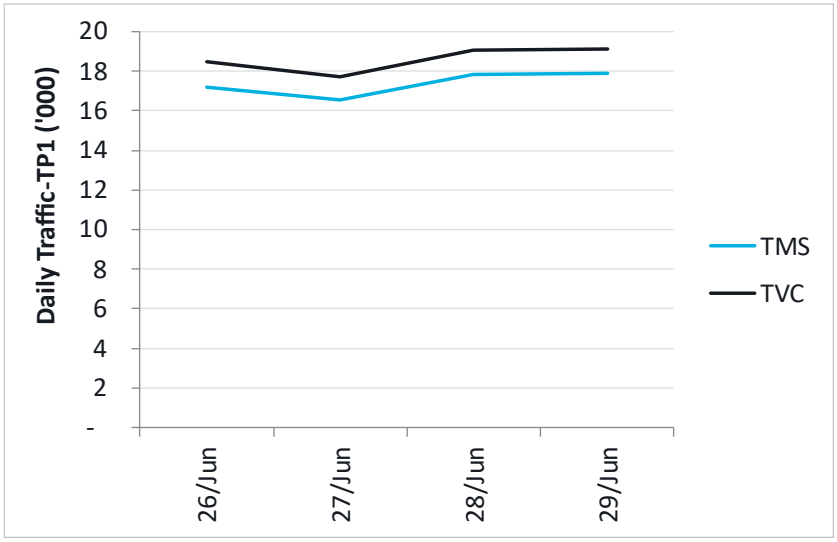
TVC v/s TMS analysis

3.28 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those particular days, as provided by the Client.

3.29 The following figures show the comparison between the daily traffic observed by TVC and TMS for the two toll plazas. As shown in Figure 3.7 and Figure 3.8 below, the TVC and TMS

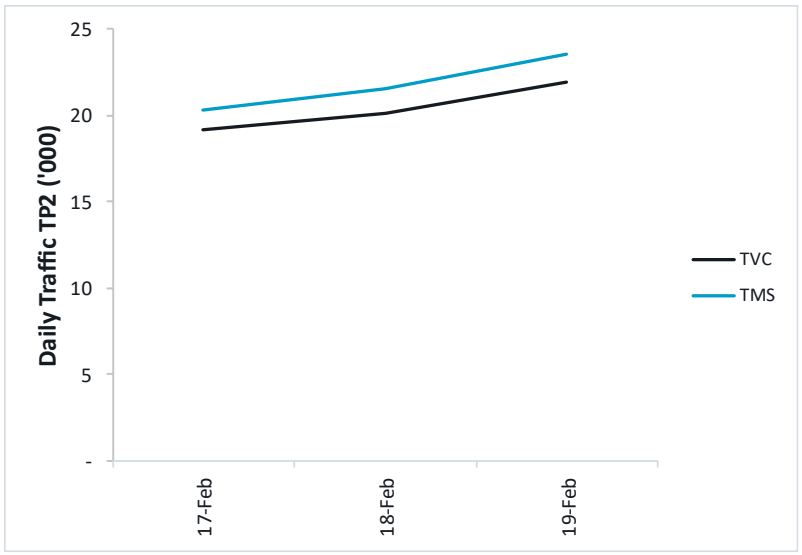
overall are within the acceptable range of variation. The vehicle category which is causing this variation is CJV which is attributable to a small proportion of local users who are not being captured by the TMS.

Figure 3.7 Comparison between TVC and TMS daily traffic data on TP1 Sikandra (2023)



Source: Steer analysis of TVC and Client TMS data

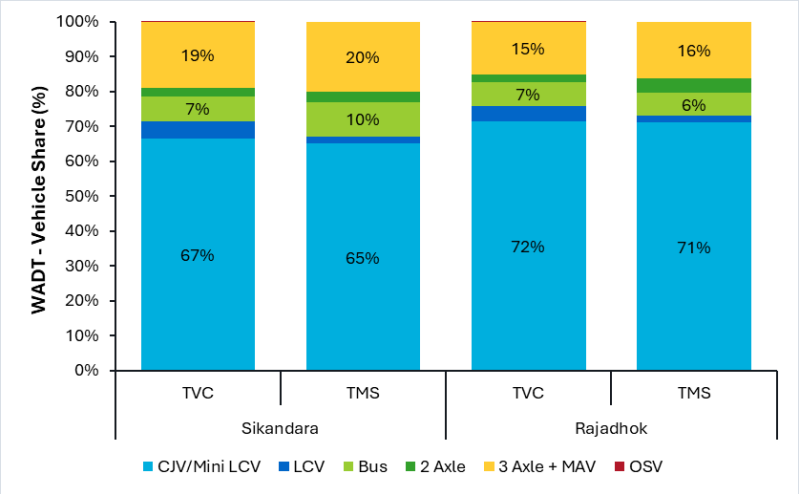
Figure 3.8: Comparison between TVC and TMS daily traffic data on TP2 Rajadhok (2026)



Source: Steer analysis of TVC and Client TMS data

3.30 The Figure 3.9 below compares the shares of vehicle types at both toll plazas observed by the TVC and TMS data. However, this difference varies across different vehicle categories. As can be seen, whilst the share of CJVs is higher for TVC compared to TMS, it is vice-versa for other vehicle categories. This difference can be attributed to common misclassification of vehicle categories as well as the TMS not recording a portion of the local mini LCVs.

Figure 3.9 Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.31 Considering the lower variation between the TVC and TMS data for the largest revenue generator 3A+MAVs, and an approximate match in the traffic volumes, the base year traffic calculated using the Client data has been used to estimate base year traffic.

3.32 As mentioned earlier, the current TMS reports 2A and Bus as separate categories. However, for comparison purposes, their volumes are being combined, as ETC single ticket 2A volumes have declined since March 2024, while Bus volumes have increased in a manner that suggests potential misclassification.

3.33 Therefore, the split that we have derived from our counts is the split we are using in our projection to forecast the growth of each individual category for this Asset.

Key findings of origin-destination analysis

Overview

3.34 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. The OD analysis presented here is based on data collected on behalf of the Client in June 2023 at TP1 and February 2026 at TP2. More recent OD survey on TP1 was not undertaken as it has a long operational history and we did not believe material changes in these patterns would have occurred during this period.

3.35 We have analysed the regional drivers of demand based on the following analyses:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.36 While zonal analysis and the list of top OD pairs help to understand ‘where’ people and goods travel, commodity distribution sheds light on ‘what’ goods get transported on this Asset. Trip length distribution shows ‘how far’ vehicles and people travel, and goods get transported. This set of analysis is used to estimate key drivers of traffic and aid in making informed forecasting assumptions related to traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.37 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples captured by the traffic counts (based on the TMS data) during the same period. Table 3.16 below presents the sample rates for key vehicle type aggregations at both toll plazas. We believe that the sample rates of the OD data are reasonable for the analysis required and that the high sample rate for goods traffic at TP1 could be due to Mini LCV-CJV related difference in classification in the TMS data.

Table 3.16: Sample rates for OD data

Traffic type	TP1	TP2
Passenger (CJV+Bus)	19%	15%
Goods (LCV+2A+3A+MAV)	72%	46%

Source: Steer analysis of OD data

Zone categories

3.38 To facilitate better understanding of key regional traffic drivers as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in Table 3.17 below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Assets being studied.

Table 3.17: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of Rajasthan	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Rest of Uttar Pradesh	Uttar Pradesh excluding parts of Uttar Pradesh which are a part of IAOI
Rest of North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir
Central NCR	Delhi State, including New Delhi
Gujarat & Maharashtra	Gujarat and Maharashtra (including Mumbai)
Central India	Madhya Pradesh, Chhattisgarh
South India	Tamil Nadu, Karnataka, Kerala, Andhra Pradesh
East & Northeast India	West Bengal, Orissa, Jharkhand and Northeast Indian states
Outside India	Nepal, Bhutan, Bangladesh

Zonal influence

3.39 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence at each toll plaza of each Asset, based on zonal aggregation listed in the previous sub-section. it should be noted that zonal influence is analysed based on trip ends and not trips.

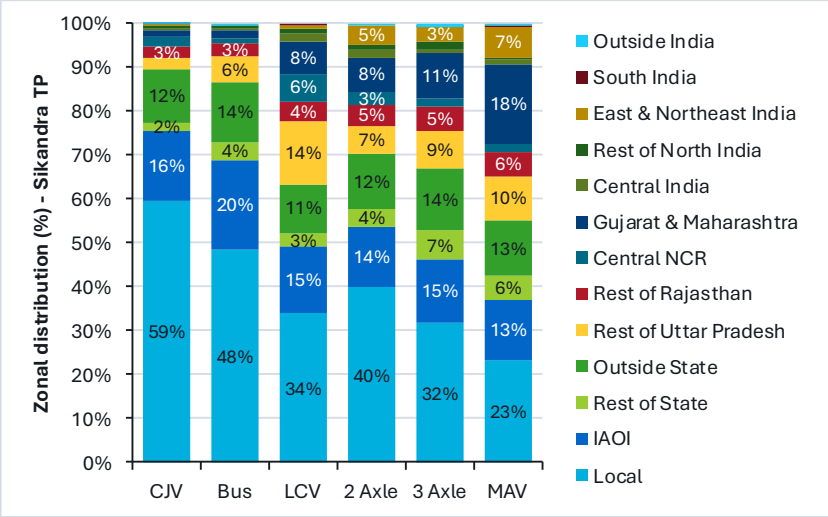
3.40 From Figure 3.10 and Figure 3.11 below, it can be seen that the influence of local + IAOI zones (trip ends in the Asset's proximity) has one of the highest shares across vehicle types. In terms of CJVs, TP1 and TP2 have a 75% and 65% share of such trips, while for MAVs, the corresponding figures are 36% and 31%. Analysing the two zone categories

separately, it is observed that as TP2 is closer to Jaipur and surrounded by an area of high urban population density, it results in a higher IAOI influence at the plaza.

3.41 In terms of MAVs, a substantial share of influence is observed from Uttar Pradesh (10% at TP1 and 15% at TP2); Gujarat & Maharashtra (18% each) as well as East & Northeast India (7% and 6% respectively)

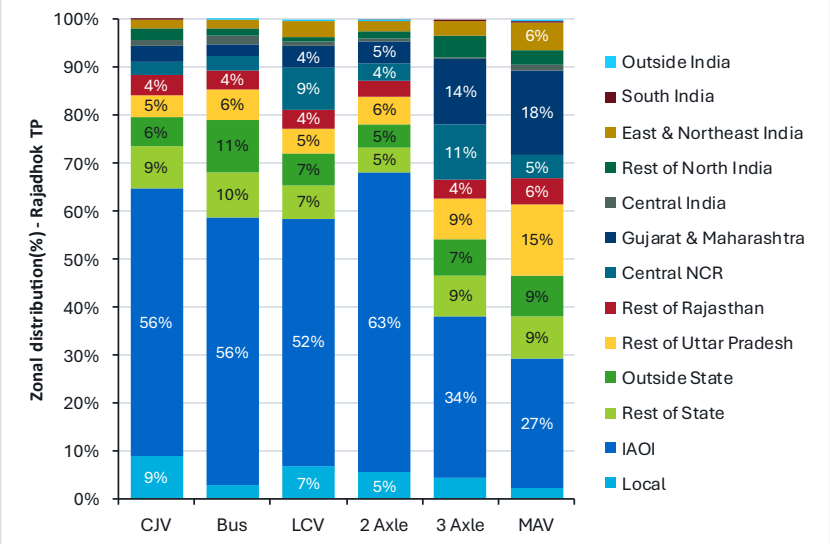
3.42 With DME becoming operational between Sohna and Dausa, the Rajadhok plaza has observed 6% of the Central NCR MAV traffic whereas Sikandra observes 2% of the Central NCR MAV traffic.

Figure 3.10 Zonal influence at TP1 Sikandra



Source: Steer analysis of OD data

Figure 3.11 Zonal influence at TP2 Rajadhok



Source: Steer analysis of OD data

Internal External analysis

3.43 Internal-External analysis helps in identifying the trips which have both the origin and destination on or near the Asset i.e. local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e. through trips (External-External or E-E). RoS here represents areas within the state which are neither local nor IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e. lying on the Asset, while 'External' zones are areas lying outside the state.

3.44 Figure 3.12 and Figure 3.13 below show the distribution of trips based on these categories. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.45 We see that on both the plazas ~30% of trips are E-E trips for MAVs. This is due to long-distance trips observed on the Asset which joins the Asset through Dausa. These are strategic movements moving between western and eastern regions in the immediate vicinity of the corridor, e.g. North Gujarat-Wester Uttar Pradesh, and therefore prefer using the Asset due to the connectivity it offers to these regions.

Figure 3.12 Internal-external distribution at TP1 Sikandra

	Internal	Rest of State	External
External	16%	7%	30%
Rest of State	4%	0%	8%
Internal	18%	4%	14%

Source: Steer analysis of OD data

Figure 3.13 Internal-external distribution at TP2 Rajadhok

	Internal	Rest of State	External
External	10%	6%	31%
Rest of State	3%	0%	15%
Internal	11%	3%	20%

Source: Steer analysis of OD data

3.46 Furthermore, in Chapter 6 we present the impacts analysis which gives an estimation of captive traffic. The non-captive traffic is a minority share, with the impacts being insignificant for all but the impact of Delhi-Mumbai expressway on TP2 Rajadhok.

Commodity distribution

3.47 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in Table 3.18 below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.18: Aggregate commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane,Maize etc.)	AGR	**AGR**
Cattle Food / Live Stock (sheep, ghoat, cow,cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	**GRO**
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	**CNS**
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	**PET**
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	

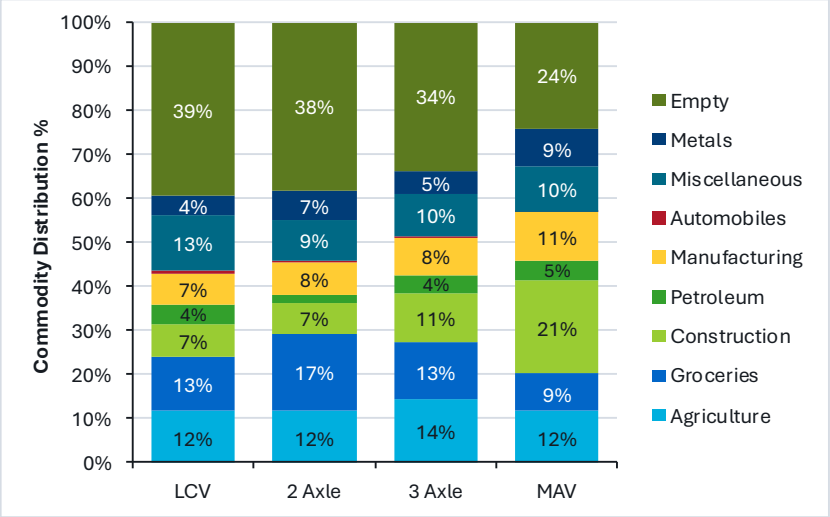
Electrical/Manufacturing items (Electronic items, medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	**MAN**
Raw Wood, Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	**AUT**
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	**MET**
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	**EMT**
Container	CTR	**MSC**
Miscellaneous (Parcel, Courier, Household items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer analysis

3.48 Figure 3.14 and Figure 3.15 present the commodity distribution for goods vehicles at the two toll plazas, at the total level as well as split by direction, towards Jaipur and Agra. As observed during our site visit, the figures below indicate that agricultural and groceries products make up about 20 - 25% of commodity share across the two toll plazas. MAVs also carry a significant share of a variety of manufactured goods between Udaipur and Gujarat at one end and Uttar Pradesh, Bihar and the rest of eastern India at the other end. Construction goods have 21% and 24% share respectively at TP1 and TP2, which includes marble being transported from Rajasthan and Gujarat towards Uttar Pradesh, Bihar, Odisha etc. Agricultural produce is mostly transported within the state of Rajasthan and manufactured products have Rajasthan, Uttar Pradesh and Delhi NCR as the top origins or destinations.

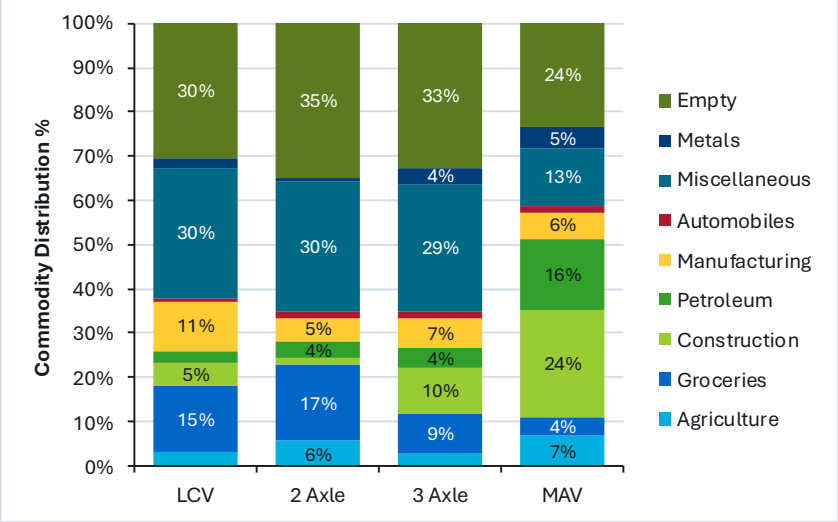
3.49 Looking by direction, a greater share of vehicles also travels empty towards Jaipur, than those travelling in the opposite direction towards Agra. Also, agricultural and grocery products make up a significant commodity shares for vehicles travelling towards Jaipur, then those travelling towards Agra. However, other commodity groups hold a greater commodity share in the direction towards Agra as compared to Jaipur, including stone, construction and petroleum products. The above is true for both TP1 and TP2.

Figure 3.14 Commodity distribution at TP1 Sikandra (Both directions)



Source: Steer analysis of OD data

Figure 3.15 Commodity distribution at TP2 Rajadhok (Both directions)



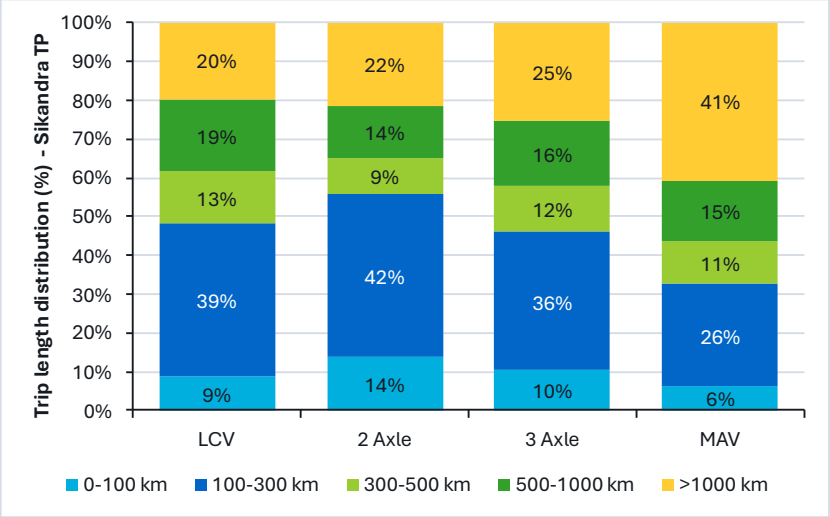
Source: Steer analysis of OD data

Trip length analysis

3.50 Trip-length distribution provides the distance-based profile of various vehicle categories. This aids in validating assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[10]

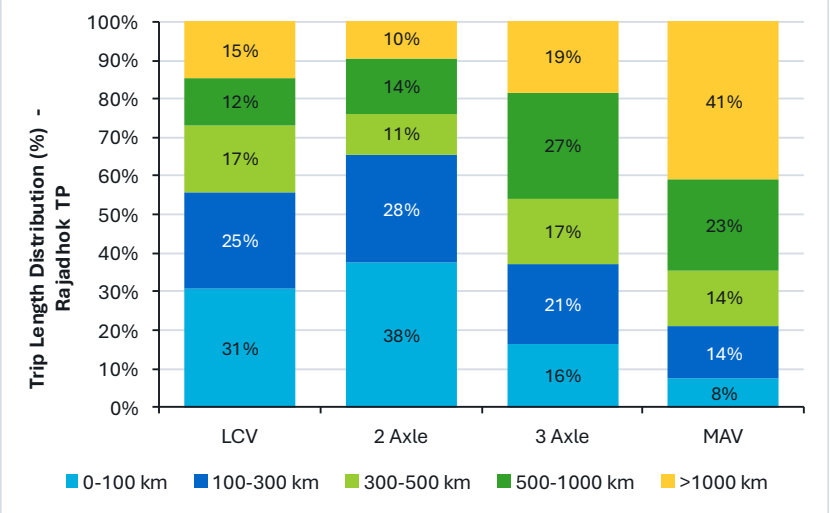
[10] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: https://developers.google.com/maps/documentation/distance-matrix/start. Travel

Figure 3.16 Trip length distribution TP1 Sikandra



Source: Steer analysis of OD data

Figure 3.17 Trip length distribution TP2 Rajadhok



Source: Steer analysis of OD data

3.51 As observed in above figures and the internal-external analysis, TP2 has a large share of local and short-medium-distance trips (up to 300 km), ranging from 21% for MAVs to 56% for LCVs, this share is lower at TP1 Sikandra, ranging from 32% for MAVs to 49% for LCVs .

3.52 In terms of long-distance and very-long-distance trips more than 500 km long, CJVs understandably do not have a significant proportion, as has been seen across other Assets around the country. As expected, MAVs show a much higher share, up to 56% at TP1 and 64% at TP2 due to long distance movements between western and eastern India. 2A vehicles at TP2 have 24% share of trips being greater than 500 km.

distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Conclusions

3.53 In FY26 the Asset witnessed a total AADT of 18,839 at TP1 Sikandra and 20,141 at TP2 Rajadhok. Looking at the vehicle shares of this Asset, the dominant vehicle class is CJV, holding 64% of vehicle share at TP1 and 72% at TP2. Further, MAVs at TP1 has a higher share (22% compared to 15% at TP2). Shares of other vehicle category volumes are consistent between the two toll plazas. Traffic has shown significant recovery starting FY22 when the Dausa-Lalsot section and Jaipur Ring Road was commissioned resulting in improved connectivity to Delhi and South.

3.54 Rajadhok's traffic in PCU terms reduced by 16.2% between FY25 and FY26 due to the opening of Bandikui spur in July 2025, leading to traffic diversion to Delhi Mumbai Expressway away from Rajadhok.

3.55 The TVC counts does show variation on the TMS, at the total level TMS is 6% lower than TVC at TP1, and 6.9% lower than TVC at TP2, primarily attributable to local CJV users. However, the differences are smaller for the larger revenue generating categories (3A, MAV and OSV combined), 1% and -4% at TP1 and TP2 respectively, which gives us confidence in the data moving forward.

3.56 The OD analysis found that in terms of zonal influence, TP1 had a higher share of IAOI trips compared to TP1, which is explained by TP2's proximity to Jaipur and a higher urban population density. CJV and Bus traffic driven with origins and destinations at both ends of the Asset corridor is seen to be driven by the urban population and tourism related drivers. The key commodities transported on the Asset on 3A/MAV trucks include construction materials, which make up around 20 - 25% of the commodity share at both plazas. Agricultural products also holds a respectable share, at 12% and 7% at TP1 and TP2 respectively. Majority of the traffic is sticky to the Asset with only 8% being external-external in PCU terms which is using the Asset as it offers excellent connectivity to the regions in the immediate vicinity of the corridor.

3.57 The overall characteristic of the Asset is strategic is nature connecting several key urban and economic activity centres of Jaipur, Agra, Bharatpur in immediate vicinity with wider generators and attractors of south Rajasthan, Gujarat, Maharashtra to Uttar Pradesh and Delhi NCR also being connected by the Asset. Urban population and tourism linked growth is seen as an added advantage for CJV and Bus traffic.

4 Socio Economic Context

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

Changes in factors such as population, economic growth (regional and national) and industrial production; and
Other local factors such as strategic port growth, and growth in local industries near the Assets.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available.

4.3 In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in the state of Rajasthan where the Asset is located.

National Level

4.5 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1 below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.6 As Table 4.2 shows, the populations of Rajasthan has grown at a faster pace compared to that of India, between FY12 and FY24. As of FY24, accounts for 5.8% f India's population

4.7 Table 4.2 shows the evolution of population in the state of Rajasthan (containing the Asset), compared to that of the country.

4.8 As Table 4.2 shows, the populations of Rajasthan has grown at a faster pace compared to that of India, between FY12 and FY24. As of FY24, accounts for 5.8% f India's population

Table 4.2: Population Growth in Rajasthan and India (2012-2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Rajasthan	69.1	82.4	1.4%
India	1,210	1,395	1.2%

Source: MoSPI estimates

4.9 Due to the complexities of patterns of urbanisation, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

Economic Indicators

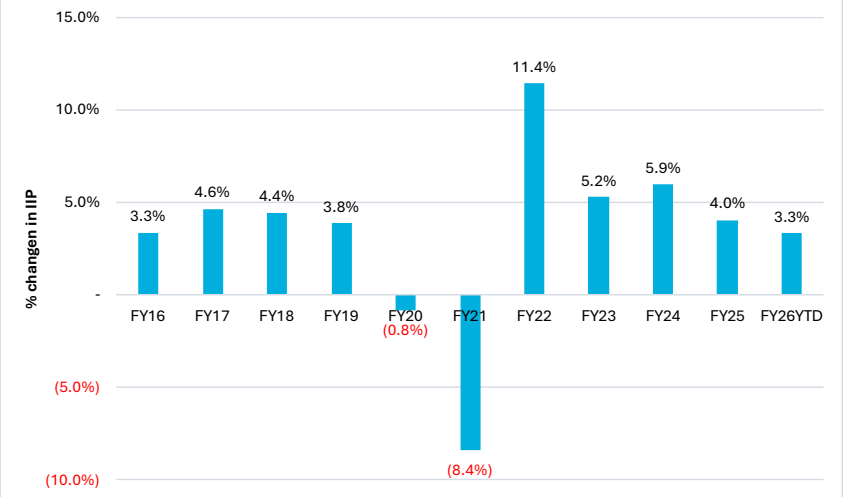
Industrial Production

4.10 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.11 At an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20 (as presented in Figure 4.1 below). In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. However, with the gradual opening up of economy post the pandemic, and recovery in consumption demand, industrial activity also recovered with time with IIP recording growth of 5% in FY23 and 6% in FY24.

4.12 The figure below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4%, and FY26YTD (till February 2026) recording 3.3% growth over FY25.

Figure 4.1: Annual growth – Index of Industrial Production



Source: Steer analysis of MoSPI data

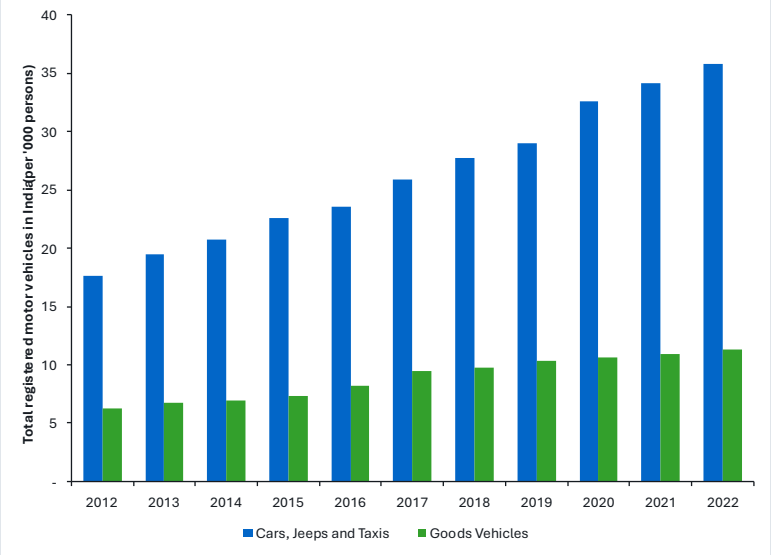
4.13 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle Ownership

4.14 The gap in car ownership between India and developed nations remains substantial – with 36 cars/jeeps/taxis and 11 commercial vehicles per thousand people, as of FY22 (the latest year for which official data is available). However, with increasing per capita income levels, a booming economy and the subsequent increase in demand for mobility, the number of registered vehicles has been on a gradual upward trend.

4.15 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. Between FY12 and FY22, the CAGR for CJV and goods' vehicles registered in India was 8.6% and 7.3% respectively.

Figure 4.2: : Car ownership in India per 1,000 population

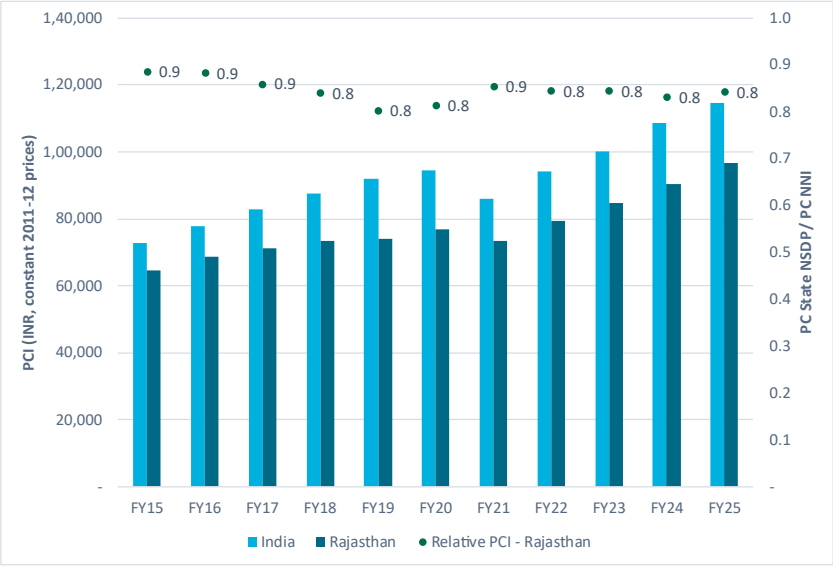


Source: International Energy Agency (IEA)

Per Capita Income (PCI)

4.16 The per capita income of the state where the Asset lies (i.e., Rajasthan) has historically varied slightly below the national average, trending at 80-90% of the national per capita income over the period FY15-FY25. While the statewide per capita income has remained below the national average, incomes near and around the Asset are higher given its proximity to Jaipur city (the state's capital). In recent years (FY22-FY25), Rajasthan recorded higher per capita income growth than observed pre-COVID (FY12-FY19) owing to strong consumption growth in the state. Going forward, we expect strong local consumption demand to drive growth in both passenger and commercial traffic.

Figure 4.3: Relative Per Capita Income (FY15-FY25)



Source: Steer analysis of MoSPI data

4.17 However, given the difficulty in obtaining granular district level PCI data it is not advisable to use this as a growth driver. Also, the long-term forecast for PCI is not available we therefore refrain from using it to forecast traffic.

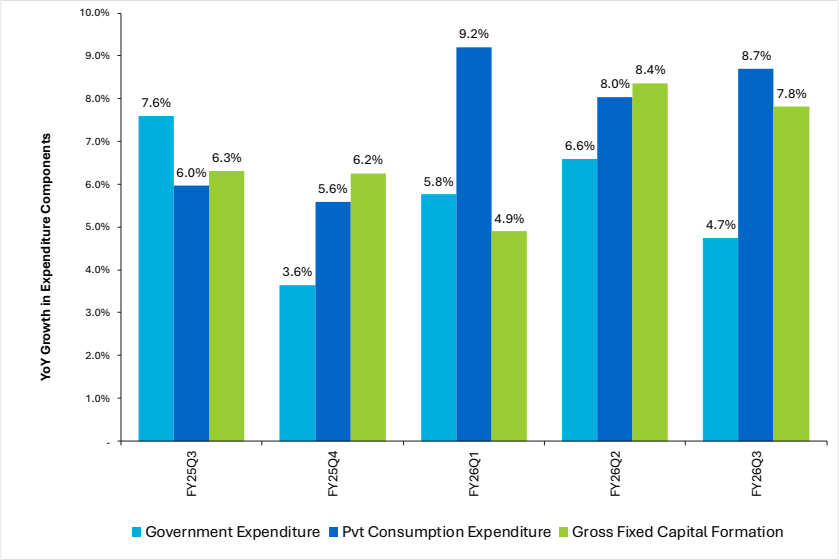
Economic growth

India's Performance

4.18 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q3 GDP at 7.8% over FY25Q3. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[11].

4.19 The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past year (FY25Q3-FY26Q3).

Figure 4.4: YoY growth in expenditure components of GDP



Source: Steer Analysis of MOSPI Data

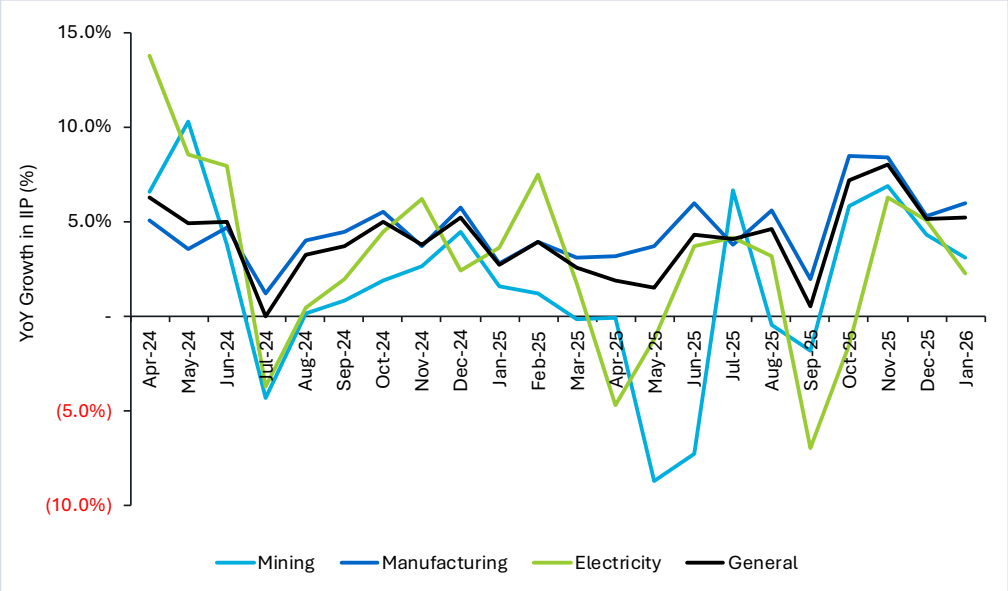
4.20 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 5.8% growth over FY25Q1 levels.

4.21 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr'25-Feb '26), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the

[11] Gov**ernment of India PIB Release (27th February 2026)**

two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward

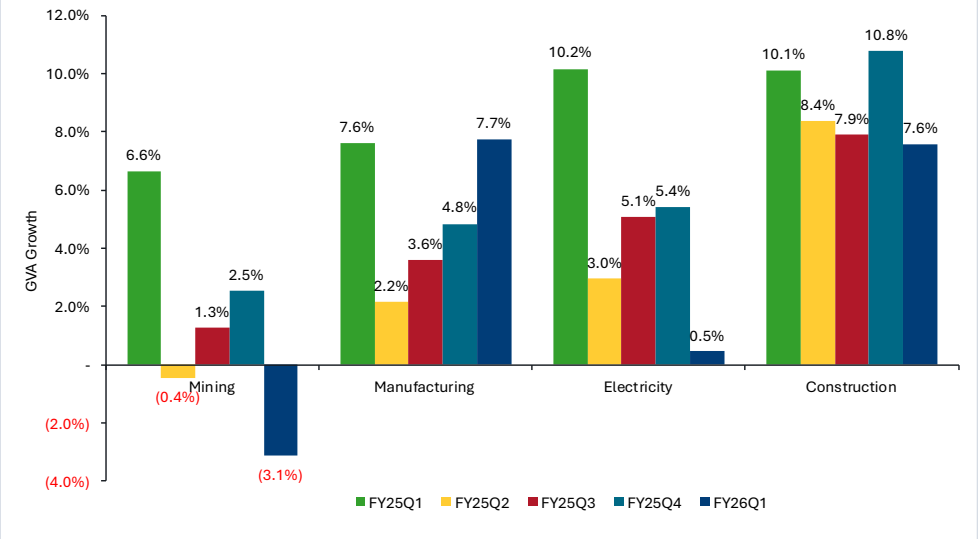
Figure 4.5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.22 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4.6: Industrial components of GVA



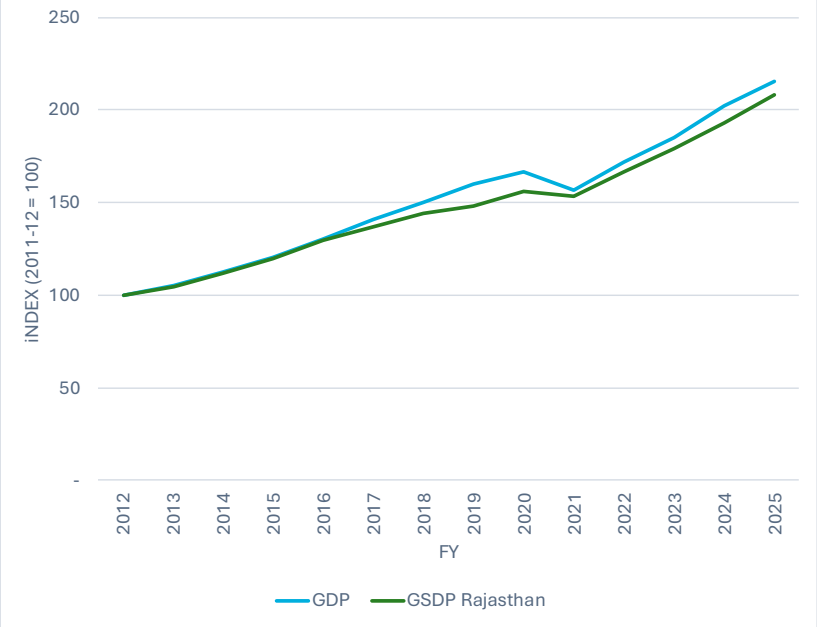
Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.23 Over the period FY12-FY25, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same period. The economic growth of Rajasthan (state GSDP) has been somewhat slower than the country overall for the past 5 years but it seems to have caught up with the national rate since the COVID19 pandemic. [12]

4.24 The Asset Jaipur - Mahua, lies in the state of Rajasthan. The state contributes approximately 5% to India's GDP. Figure 4.7 illustrates the evolution of India and Rajasthan GDP.

Figure 4.7: Evolution of Rajasthan's state GDP and national GDP, FY12-25



Source: Ministry of Statistics and Program Implementation (MoSPI)

Economic activity in the state

4.25 Rajasthan, the largest (area-wise) state in India, is in the north-western part of the country. In terms of sectoral contribution to the state GDP, tertiary sector has the highest share followed by primary and secondary, with the shares remaining stable during the last six years (i.e., 2019-2025).

4.26 The tourism and transport sector constitutes a major share of state's tertiary sector, accounting for roughly 15% of the state's economy as of 2024[13]. Rajasthan is considered a favoured tourist destination in India, with key tourist destinations being Jaipur, Jodhpur, Jaisalmer, Bharatpur and Udaipur. In 2018, the state attracted over 50 million domestic

[12] GSDP is the Gross State Domestic Product i.e., the GDP equivalent for a particular state, it is the final value of goods and services produced by a particular state

[13] Rajasthan Tourism sector

tourist arrivals in the country whereas, in terms of foreign tourist arrivals it holds fifth position in the country with over 1.7 million[14] tourist visiting state every year.

4.27 In terms of secondary sector, the state has key industrial areas in Kishangarh (marble); Manesar (automobile), Pali and Jodhpur (textiles), Chittorgarh -Neemuch (cement), Kota (stone). Rajasthan is one of the largest minerals producing state in India and is the sole producer of lead and zinc ores in India. The state has one of the largest limestone reserves, making it a hub for cement industries. In terms of agricultural produce, the state is largely known for its production of wheat, cotton, cereals and pulses.

Forecasts for growth drivers

4.28 Following the discussion in Chapter 4 on the nature of economic activity in the state of Rajasthan, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth. Particularly, we have based our forecast on GSDP using forecasts of GDP as provided by the Client.

National GDP

4.29 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[15]

4.30 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 and 6.5% in FY25. GDP growth remained strong through FY26, with quarterly growth of 7.8% in Q1, 8.4% in Q2 and 7.8% in Q3, while the RBI estimates full-year FY26 growth at 7.6% under the revised GDP series.

4.31 Figure 4.8 below shows client provided GDP projections for India. The forecast provided by the Client expects the India GDP to grow at 6.5% between FY25-FY27 and gradually tapering down to 4.1% by FY32, end of concession. The India GDP growth forecast provided by the Client is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[16] in the medium term.

[15] **Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu** (September 2020)

[16] **Survey of Professional Forecasters on Macroeconomic Indicators – Results of the 93rd Round (April 2025)**

4.32 Over the near term, Rajasthan's GSDP growth assumes to continue outpacing the national GDP throughout the concession period. We believe this is a realistic position based on the current and future development plans of local and state governments.

4.33 There are significant investments expected to take place as part of the state's plan and Rajasthan is expected to receive a significant proportion of these investments, given its leading position in industrial investments. Higher than expected GSDP growth rate across the concession period could be achieved if such investments were realised as they are expected to give an additional boost to Rajasthan's state economy.

4.34 In the long term, we believe that as other smaller state economies of India catch up with the national economic growth, the gap between growth rates of larger state economies, such as Gujarat, Maharashtra and Karnataka, and the national GDP growth rate will start reducing.

Figure 4.8: GDP-GSDP forecast

5 FY26 Base year AADT and Traffic growth analysis

Introduction

5.1 In this chapter, we present our approach, assumptions, and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'. To understand the historical traffic trends in relation to these growth drivers, we carry out regression analysis to determine the historical relationship between traffic belonging to each major vehicle category and its macroeconomic growth driver at each toll plaza. The traffic demand is the dependent variable while the one or more identified growth drivers are the independent or explanatory variables.

5.3 Typically, passenger and light commercial vehicles like cars, buses, LCVs and 2-axle trucks grow in line with the GSDP of the state where the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because most light vehicles tend to travel shorter distances within the state, whereas a significant proportion of heavy vehicles carry commodities for long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilized information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

5.6 The base traffic for FY26 has been estimated using 11 months of actual traffic data (April to February). Each toll plaza's seasonality correction factors were applied on the actual

MADTs of Apr-25 to Feb-26 to obtain seasonally corrected estimates for FY26 traffic. An average of these estimates was considered to be the FY26 base traffic.

Seasonal Correction Factors

5.7 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.8 In order to normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.9 To achieve this, we studied the seasonality between monthly average daily traffic (MADT) – We have analysed the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling (as described in Chapter 3), excluding the years that were impacted by specific events. This averaged seasonality trend is then applied to the monthly traffic to obtain AADT as mentioned in the previous sections.

5.10 Table 5.1 and Table 5.2 present the assumptions in SCF used to estimate the AADT:

Table 5.1: Seasonality correction factors for TP1 Sikandra

	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar

Adopted FY26 base estimates

6.1 Based on the above methodology and inputs, the adopted base for toll plaza has been shown below:

Table 5.3: Adopted base estimates: TP1 Sikandra

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	11,580	11,858	11,982	3.5%
LCV	364	351	353	(3.2%)
Bus/2A	2,353	2,421	2,436	3.5%
3A/MAV	3,933	4,060	4,087	3.9%
Total	**18,230**	**18,690**	**18,857**	**3.4%**
PCUs	**34,983**	**36,085**	**36,364**	**3.9%**

Table 5.4: Adopted base estimates: TP2 Rajadhok

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	18,299	14,537	14,835	(18.9%)
LCV	484	400	402	(17.0%)
Bus/2A	2,418	2,212	2,234	(7.6%)
3A/MAV	3,553	3,075	3,121	(12.1%)
Total	**24,753**	**20,223**	**20,593**	**(16.8%)**
PCUs	**40,640**	**34,201**	**34,761**	**(14.5%)**

Source: Steer analysis; FY25 actual full year, FY26YTD includes 11 months (Apr-Feb) of FY26, FY26A is adopted base for FY26

5.11 As we can see from Table 5.3 and Table 5.4, FY26A AADT estimates are 3.4% higher and 16.8% lower than FY25 AADT for TP1 Sikandra and TP2 Rajadhok respectively. Rajadhok's adopted base traffic in FY26 is lower than FY25 as the diversion of traffic from the Asset to Bandikui spur of the Delhi Mumbai expressway towards Jaipur took place.

5.12 Sikandra's CJV volume in FY26 is expected to remain at FY25 levels in in FY26 as FY25 witnessed high traffic on account of the Mahakumbh resulting in an one-time increase in volumes on both Sikandra and Rajadhok toll plaza.

5.13 We have combined Bus and 2A volumes for our base estimation because as mentioned before, TMS reports discrepancies in the data. Therefore, the split that we have derived from our counts is the split we are using in our projection to forecast the growth of each individual category for this Asset.

Estimation of background elasticities

5.14 Elasticities, in the case of traffic growth are the relationships between traffic and growth drivers. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide the forecasts of background traffic growth rates.

5.15 The below table presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.5: Identified growth drivers to model traffic growth at Asset level

Vehicle type	GDP India	GSDP Rajasthan
Car		100%
LCV		100%
Bus		100%
2A	100%	
3A	100%	
MAV	100%	

Source: Steer analysis of Client data

5.16 The TMS data for the Asset reports 3A and MAV together where Bus and 2A reported separately, hence splits were required to understand the 3A and MAV growth pattern. For this Asset Car, Bus and LCV do more regional movement as validate from OD trip length and zonal analysis hence the growth of this vehicle category is more influenced by Rajasthan GSDP. Whereas 2A, 3A and MAV carry heavy commodities like construction material and agricultural products from Rajasthan across states and internationally hence more linked to GDP growth.

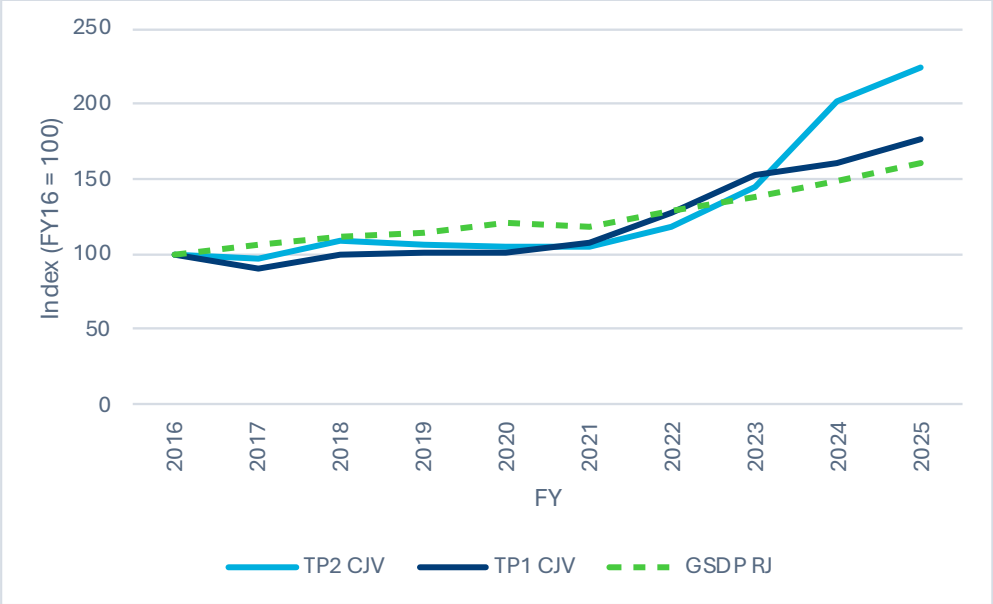
5.17 For the purpose of regression analysis we have considered the period of FY16-25. FY16 and before were chequered period for the Asset with combination of illegal mining and overloading ban. The commercial traffic did not witness significant negative impact on volumes except for first nation-wide lockdown in March and April 2021. Hence, we have considered FY21 and FY22 for the regression analysis.

5.18 In recent historical traffic performance across national highway corridors, a notable trend has emerged: there is a noticeable shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in the Assets FY23 and FY24 performance as well, which has been discussed in detail in the subsequent sections. As a consequence of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

CJV

5.19 It was observed from the OD data, that CJVs primarily cater to regional movements between Jaipur, Bharatpur, Agra and other towns lying in the vicinity of the Asset. We have therefore assumed Rajasthan GSDP to be the growth driver for modelling growth of CJV traffic. Figure 5.1 shows the relationship between indexed values of CJV traffic and Rajasthan GSDP at TP1 Sikandra and TP2 Rajadhok. CJV traffic on TP1 has shown 6% growth from FY16-24 while for the same period TP2 recorded 9%.

Figure 5.1: Relationship between CJV traffic and Rajasthan GSDP



Source: Steer analysis of Client TMS data and publicly available GSDP data

5.20 Generally, we would expect that in fast-growing economies with relatively low car ownership levels, car traffic growth rates are often in line with or are slightly higher than growth in GSDP/GDP (i.e. suggesting elasticities just above 1.0). Further, the opening of the Delhi Mumbai section upto Lalsot has had a significant impact on Car traffic on the corridor on both toll plazas adding additional impetus to car growth. This has also increased the influence of tourism related movement on the Asset, due to the significant volumes contributed by DME onto the corridor and hence it is expected that car growth will remain robust on the Asset. In addition there is an expected increase in car ownership proportion of overall population as the economy grows.

5.21 Taking note of the positive outlook for passenger traffic on the tourism-driven Asset we have assumed a forecast background elasticity of 1.10 with respect to Rajasthan GSDP for CJV at both the toll plazas.

LCV, Bus, 2A

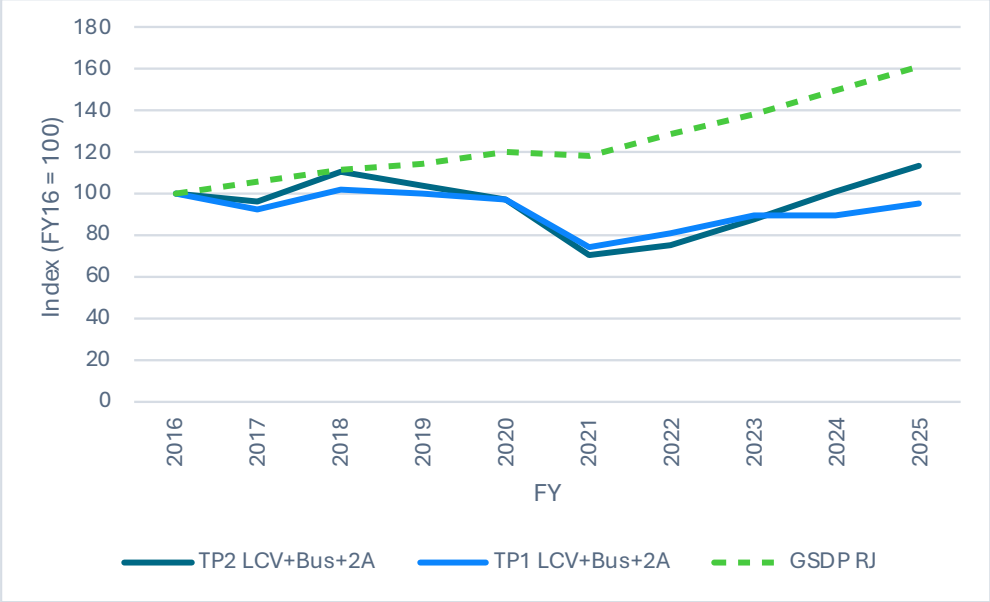
5.22 As discussed in the OD data analysis, LCV, Buses, and 2As are employed for more regional travels within the state - Rajasthan in this example - than heavier vehicles such as 3A and MAV. More than 80% of LCVs and Buses, and 70% of 2As, complete their journey in Rajasthan. As a result, we assumed that the Rajasthan GSDP would be a better growth driver to predict the increase in Bus+LCV traffic. Figure 5.2 below depicts the link between the indexed values of combined Bus+LCV traffic and Rajasthan's GSDP.

5.23 In many sections of the country, bus growth is entirely supply-driven, with new buses purchased and deployed by the government at varying intervals. According to our experience across the country, buses on inter-urban and tourism corridors have elasticities ranging from 0.4 to 0.6 in relation to the GSDP. We estimated an elasticity of 0.5 with regard to GSDP Rajasthan based on the regression results and benchmarks.

5.24 Between 2016 and 2024, the growth rate of Bus+2A+LCV remained flat. During this time period, it was noticed that disaggregate traffic for LCVs rose slower than traffic for Buses

and 2As. This could be attributable to a variety of factors, one of which is the reclassification of LCVs and 2As, which has been seen as a prevalent tendency across the country's toll highways. However, beginning in 2022, the combined volume of Bus+LCV+2A has began to show indications of recovery, as shown in the graph below.

Figure 5.2: Relationship between Bus+LCV+2A combined traffic and Rajasthan GSDP



Source: Steer analysis of Client TMS data and publicly available GSDP data

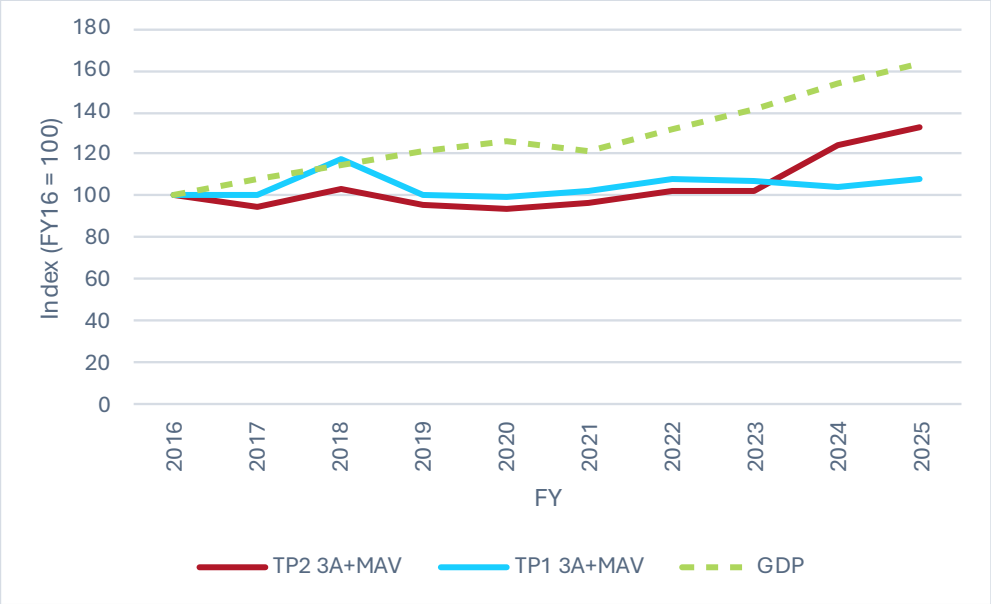
5.25 Based on the results of the regression, analysis of historical trends on the Asset, as well as our previous experience on benchmark Assets the elasticity assumption for LCVs is 0.3 on both TPs, and for Bus which have witnessed relatively stronger growth is 0.5 for both toll plazas. 2A have benefited from increase in Courier/Parcel movement and continued on a positive growth profile over the last 3-4 years and are expected to have an 0.8 elasticity to GDP.

3A/MAV Trucks

5.26 In comparison to lighter vehicles such as LCV and 2A, 3A and MAV have more national or long-distance movements that span multiple states. Given that manufacturing-related commodities tend to dominate commodity distribution, resulting in traffic growth in 3A and MAV vehicle categories to be dependent on industry demand-supply ecosystems spread across the country, we have assumed GDP as the growth driver to model traffic growth in 3A and MAV vehicle categories. Figure 5.3 below depicts the relationship between the indexed values of 3A+MAV combined traffic and India's GDP.

5.27 Historically, 3A+MAV combined traffic grew positively in the FY16-18 period at 8.2% at TP1 Sikandra and 1.4% at TP2, before losing volumes in FY19 and FY20.

Figure 5.3: Relationship between 3A+MAV combined traffic and India GDP:



Source: Steer analysis of Client TMS data and publicly available GDP data

5.28 Major reasons associated with this slower growth is implementation of stringent sand mining policy 2020 in Rajasthan which reduced the illegal sand mining and associated 3A and MAV traffic (FY18-FY20) in the region. Completion of Jaipur Ring Road improving access of regions beyond Jaipur. Opening of DME, which resulted in higher 3A and MAV traffic on Rajadhok plaza, whereas the Sikandra plaza lost commercial traffic which as destined to Alwar which earlier used to cross the Sikandra plaza but now diverts via DME. Between FY23 and FY25 the Asset registered negative 2% 3A+MAV growth on Sikandra and 21% on Rajadhok. Since DME is now operational for more than 12 months now, we expect very minimal loss on Sikandra and return of normal traffic growth on Rajadhok plaza.

5.29 The Asset reports 3A+MAV combined, in our experience of other toll roads, 3As to grow slower than MAVs due to an increasing preference seen for MAVs instead of 3As for long-distance movements. This is because MAVs have higher load capacity which generate economies of scale resulting in lower costs. However, it is unlikely that 3A trucks will disappear from the market completely as there are best suited for certain commodities or movements.

5.30 Based on the above points, we have assumed elasticities of 0.40 and 0.85 for 3A and MAV trucks respectively, with respect to India GDP growth.

Forecasts for background elasticities

5.31 Table 5.6 presents a summary of the results of the regression analysis carried out on historical toll plaza data and the macroeconomic (GDP/GDSP) growth, along with the assumed forecast elasticities for background traffic growth.

5.32 The forecast elasticities are assumed to remain constant over the concession period as the logistics sector in still in early stages of development in India (95% of trucks still owned by operators owning less than 5 trucks). Car ownership levels are still around 30-35 per 1000 people, and it is likely to take a few years before the market reaches maturity.

These trends are based on a long-term understanding of historical relationships and an overall outlook on the growth of the region and the country.

Table 5.6: Derived implied elasticities and assumed forecast elasticities for background growth

Vehicle type	Growth driver	History		Forecast	
		Derived elasticity	Period Considered (Without Dummy)	Assumed forecast elasticity	Evolution of elasticity
TP1 Sikandra					
Car	GSDP Rajasthan	1.20	FY16-25	1.10	No change
LCV*	GSDP Rajasthan	(0.10) *(LCV+2A+Bus)*	FY16-25	0.30	No change
Bus*	GSDP Rajasthan		FY16-25	0.60	No change
2A*	GDP		FY16-25	0.80	No change
3A*	GDP	0.15 (3A+MAV)	FY16-25	0.10	No change

6 Forecasts: Network overlays and forecasts

Introduction

6.1 Following the discussion on estimated and assumed forecast background growth rates in the previous chapter, this chapter first deals with the forecasting assumptions around base year AADT and potential impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and growth of toll rates for the forecast period which have been used to forecast revenues as derived from forecast traffic. This chapter summarises traffic growth rates for the forecast years.

6.2 All traffic is presented as AADT for vehicle category at each plaza, for financial years (April-March). All revenue is presented in INR (nominal terms). Though FY32 is the last year of concession, we have developed our forecasts until FY32 for the Client's reference.

Analysis of potential network/developmental impacts

Summary of alternate routes and planned changes

6.3 This section details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed in previous chapters, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

6.4 We have estimated impacts of potential network changes and developments around the Asset. These are indicated in Table 6.1.

Table 6.1: List of network/other developments

	Development	Route affected	Year of completion	Impact (+/-)	Plaza
1.	Completion of construction of Delhi-Mumbai Expressway	Asset route: Delhi-Dausa+Dausa-Kota+Dausa-Godhra Alternate route: Jaipur-Delhi via DME Spur	FY27	-ve	TP1 & TP2
2.	Completion of Agra-Gwalior Construction		FY27	+ve	TP1 & TP2

Source: Steer analysis.

6.5 The map below shows the immediate road network surrounding the Asset.

Figure 6.1: Alternate routes and Asset route shown against the regional network context

Source: Steer analysis and cartography

Impact assessment for network/other developments

6.6 As seen in the previous sub-section, the assessed impacts primarily fall into either the category of road network developments or development in other modes of transport. Under network developments, changes in the road network could be either brownfield (upgrade to existing road) or greenfield (development of new road). We typically assess impacts of the changes in costs and travel time on routes in these networks using binary logit models that compare generalised journey costs (GJC) between Asset and alternate routes. However, each impact is dealt individually in its own network or industry context.

6.7 'Summary of impact assessments' below include a narrative of each of the improvements, and impacts associated from each of these on our traffic forecasts. Please note that all traffic volumes for impacts were estimated, and impact rates were applied on FY25 AADT.

Diversion due to the Delhi-Mumbai Expressway

6.8 The Delhi-Mumbai Expressway is a greenfield expressway being developed to provide an improved level of service to long-distance traffic between North and Western India, compared to the existing network of national highways that are already operating at high levels of utilisation. Though the Asset currently does not directly serve north-south movement (e.g., Delhi-Jaipur and Jaipur-Gujarat) as the NH8 directly provides connectivity to them, the Delhi-Lalsot section of the expressway has been

operationalized since Q4 FY23 which provides faster and unhindered connectivity through an interchange with the Asset near Dausa at km-169. As illustrated in the alternate route map, the diverted traffic through the expressway would pass only through TP2 Rajadhok.

6.9 We have considered the following three types of north-south movements for this impact:

- **Delhi-Jaipur**: These movements currently use the NH8 via Neemrana. The route through the proposed expressway via Dausa provides a competitive alternate with high time savings and good end-to-end connectivity, despite higher toll rates.
- **Gujarat and southern Gujarat-Jaipur**: These movements currently use the NH8 via Kishangarh. The route through proposed expressway via Dausa does not provide a competitive alternate given the Chittorgarh-Kota non-expressway section slows down the journey.
- **Southern Rajasthan-Jaipur**: These movements currently use the NH8 via Kishangarh. The route through the proposed expressway via Dausa provides a competitive alternate with high time savings and good end-to-end connectivity, despite higher toll rates.
- **Agra-Jaipur:** East-west movements between Agra and Jaipur are also diverting to Bandikui spur at Dausa, thereby avoiding Rajadhok toll plaza.

6.10 Key sections of the expressway are already open to traffic, including the Sohna–Dausa–Lalsot segment (inaugurated February 2023), the Madhya Pradesh section (opened September 2023), the Vadodara–Bharuch segment (opened February 2024), and the Kota–Bundi section (opened December 2024). Additionally, the 67-km Bandikui to Jaipur Ring Road spur is anticipated to become operational end of 2025. Despite these advancements, the overall project has faced delays due to factors such as slow contractor progress, land acquisition challenges, and force majeure events, particularly affecting a 140-km stretch between Surat and the Gujarat-Maharashtra border.

6.11 A 67-KM Spur of DME between Jaipur and Dausa known as Badnikui spur has been discussed, and its construction contract was awarded in Mar'22. This has been open to the public from July 2025 and is expected to lead to a further decline in traffic on Rajadhok as it provides a faster alternate route. While FY26A base traffic of Rajadhok accounts for the expected decline in the forecast months of FY26 (October 2025 to March 2026), FY27 is likely to see a further decline over FY26 as the impact did not fully play out in FY26. We have accordingly assumed a further decline in traffic from FY27. Since the Bandikui spur allows traffic to bypass Rajadhok and not Sikandra, the magnitude of the impact at Rajadhok is larger.

Table 6.2: Impact due to completion of Delhi-Mumbai Expressway Spur, TP1 Sikandra

Vehicle type	FY27 onwards

Completion of Agra-Gwalior Construction

6.12 Additional construction material required for the Agra-Gwalior Expressway will be transported through the JMTL Asset, which will further increase MAV traffic from FY26 onwards. However, we assume that this impact will taper off by FY29, as the expressway construction is expected to be completed by then. The phasing of the impact will see partial impact in FY27, and 100% of the impact playing out in FY28.

Table 6.4: Completion of Agra-Gwalior Construction

Impact	TP1 Sikandra		TP2 Rajadhok	
	FY27	FY28/FY29	FY27	FY28/FY29
MAV	1.1%	1.4%	1.2%	1.5%

Revenue forecasting assumptions

6.14 To forecast the revenues for a particular year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate,

which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e., traffic (trips) to tickets sold, "toll segmentation" provides the latter i.e. the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecasts.

Trip factors

6.15 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in the table below:

Table 6.6: Trip factors at TP1 Sikandra

Forecast	CJV/Mini LCV	LCV	Bus	2A	3A/MAV
Single	1	1	1	1	1
Return	2	2	2	2	2
Monthly	45	45	50	45	45
Local commercial	1	1	1	1	1
Local Personal	1	1	1	1	1

Source: Steer analysis of Client TMS data

Table 6.7: Trip factors at TP2 Rajadhok

Forecast	CJV/Mini LCV	LCV	Bus	2A	3A/MAV
Single	1	1	1	1	1
Return	2	2	2	2	2
Monthly	45	45	50	45	45
Local commercial	1	1	1	1	1
Local Personal	1	1	1	1	1

Source: Steer analysis of Client TMS data

Toll segmentation

6.16 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles[17].

6.17 Across multiple assets, the share of annual pass trips has been rising on a monthly basis since August 5. A corresponding decline in other ticket categories including Single and Return journeys has been observed.

6.18 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and post-annual pass segmentation from 15th August 2025 till 28th

[17] Finalization-Concessionaire-Annual-Pass-Facility-on-NHs-01092025.pdf

February 2026. The share of annual pass trips in March 2026 has been assumed to be the same as the share of annual pass trips in the last 10 days of February 2026.

6.19 The segmentation for CJVs in FY27 has been assumed to be the same as the estimated March 2026 segmentation as trends suggest that the share of annual pass trips have stabilised.For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Feb) as discussed in the earlier sections, can be considered a normal period.

6.20 The tables below summarise the forecast segmentation assumptions for each of the toll plazas.

Table 6.8: Forecast toll segmentation, FY26 onwards- TP1 Sikandra

Ticket type	CJV (FY26)	CJV (FY27)	Mini LCV	LCV	Bus	2A	3A/MAV
Single	78%	62%	93%	96%	95%	95%	99%

Overloading

6.21 Overloaded vehicles on the Asset are charged twice the toll fee they would otherwise pay for a Single ticket at the toll plaza. We have considered FY25 actual overloading shares and assumed that they would continue in the forecast years. Table 6.10 shows the

assumptions for share of overloaded Single journey vehicles that are considered to pay twice the Single journey toll fee due to overloading.

Table 6.10: Overloading assumptions for forecast years FY26 onwards

Vehicle type	Single	Local Commercial
TP1 Sikandra		
LCV	1.8%	0.0%
Bus	0.1%	0.0%
2A	2.2%	0.1%
3A/MAV	3.0%	0.0%

Bus	0.5%	0.0%
2A	3.2%	0.0%
3A/MAV	2.5%	0.0%

Source: Steer analysis of Client data

Toll evolution

6.22 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is July) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.23 We have used actual toll rates from the FY26 toll notifications and latest print WPI for the month of March'25[18] for FY26 to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in Table 6.11 below. The upward trend in inflation is expected to continue in the medium term, before gradually tapering to 4.1% by FY32 when the concession period ends.

6.24 These WPI forecasts provided by the Client. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the Client.

Table 6.11: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.05%
FY27	3.88%
FY28	5.0%
FY29	5.1%
FY30	4.9%
FY31	4.4%
FY32	4.1%

[18] Latest release WPI

Source: FY27 onwards WPI print as per client inputs

Revenue reconciliation

6.25 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue against the modelled revenue. For the Asset we have reconciled daily level reported revenue for FY26YTD with the modelled revenue based on FY26YTD MADT and forecast assumptions on toll segmentation, trip factors and toll rates.

6.26 The comparison, as shown in Table 6.12 below, shows that modelled revenue overall is within a variation of 0.2-0.3% on average from the reported revenue. This gives us confidence that the revenues estimated using the traffic data in our forecasts are accurately representing the revenues being reported from the Asset.

Table 6.12: Revenue reconciliation for FY26YTD

Toll Plaza	Steer modelled daily revenue (INR lakhs)	Reported daily revenue (INR lakhs)	Difference (%)
TP1 Sikandra	25.22	25.25	0.1%
TP2 Rajadhok	20.06	20.09	0.2%

Source: Steer comparison between modelled and reported revenue for FY26YTD

Traffic and Revenue forecasts

6.27 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue for the forecast period for the Asset. The table below presents the AADT/PCU and revenue forecast growth rates and CAGRs on this Asset. Further, Appendix C presents the AADT and revenues for the forecast period.

Table 6.13: Traffic forecasts (with impacts) forecast for TP1 Sikandra

Upside and Downside cases

Upside and Downside scenario assumptions

6.29 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.30 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.31 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.21: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.32 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside (pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.33 The upside case impacts included in forecasts are summarised in below.

Table 6.22: Summary of impacts on the Assets

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact	
			TP1 Sikandra	TP2 Rajadhok
Completion of construction of Delhi-Mumbai Expressway	FY27	+25% of base case	2A: (0.2%) 3A: (0.3%) MAV: (0.3%)	CJV: (8.2%) LCV: (7.2%) Bus: (3.9%) 2A: (3.9%) 3A: (6.7%) MAV: (5.0%)
Completion of Agra-Gwalior Construction	FY27*		MAV: 1.8%	MAV: 1.9%

Summary outlook

6.36 Passenger traffic on the Asset is driven by local movements connecting key urban centers of Jaipur, Agra, Alwar, and Bharatpur. Tourism and leisure travel between Jaipur at one end and Bharatpur and Agra at the other also contributes to passenger and bus movements, as the Asset is part of the Golden Triangle corridor (Delhi NCR, Agra, Jaipur). Even though the recent pandemic impacted passenger and tourism-related traffic, the trend of increased use of personal vehicles has led to a good recovery of car traffic in recent months. TP2 Rajadhok has shown stronger traffic growth, especially in the CJV category, due to its proximity to Jaipur and the operationalization of the DME spur to Lalsot in February 2023 and until Sawai Madhopur in September 2024, enhancing connectivity to Delhi. However, with the new 67-km Bandikui to Jaipur Ring Road spur (part of the DME) opening in July 2025 this incremental traffic for TP2 has diverted to the spur (as can be seen in the FY26 traffic at Rajadhok), as the new link offers a faster and shorter route between Delhi and Jaipur.

6.37 Goods traffic is driven by agricultural commodities, construction-related traffic including stone and sand, apart from a good spread of consumption-related commodities meeting urban demand. The completion of large-scale construction activity in the vicinity of the Asset, combined with limited sand movement and network developments like the construction of the Delhi Mumbai Expressway, had temporarily caused a slowdown in the Asset's traffic growth. These effects have largely receded in recent years. As the economic recovery gathers pace, the Asset is expected to see traffic growth aligned with the historical trends observed in the long term. The strong recovery in recent months has shown underlying strength in the traffic growth drivers along the Asset corridor, which is expected to continue driving growth. Heavy vehicles (3A/MAV) primarily cater to long-distance movements between western and eastern India.

6.38 Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys (including OD surveys from June 2023 at TP1 and February 2026 at TP2) and the toll management system (both historical and current, up to March 2026), macroeconomic assumptions prescribed by the Client, feedback from Client meetings, and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarized.

6.39 Overall, we see a positive outlook for the region and the Asset, given that it serves major urban centers of Jaipur, Agra, Bharatpur, Alwar, and Delhi NCR. It is also the primary route on the tourism corridor connecting Jaipur with Bharatpur and Agra. The underlying growth drivers of the corridor are strong and are expected to deliver long-term sustained growth.

Appendices

A Developments in sandmining

A.1 This appendix provides a chronological account of developments – policy, regulatory and judicial – in sandmining applicable across India and particularly in Rajasthan. Please note that this list is not exhaustive and is meant to gain a high-level understanding of the issues surrounding sandmining that affect movement of sand on the Asset.

Table A.1: History of policy and regulatory changes, and court judgements affecting sandmining

Event	Timeline
National	
Recommendations of MoEF core group	2010
SC ruling - Orders MoEF to formulate guidelines for sustainable sand - mining	Feb FY12
MoEFCC Sustainable Sand Mining Management Guidelines - Calls for site-specific surveys by district administration - Environmental clearance mandatory for all sand mines - DEAC and DEIAA committees for less than 5-hectare mines Stop of mining during monsoon months (June-September)	Mar FY16
Amendment of EIA Notification 2006 - EI clearance mandatory for all small-scale sand mines Treat cluster mines within 500 m as single mine	May FY17
SC ban on sandmining; prohibits 82 large sandmining lease holders	Nov FY18
SC refuses to remove ban	Jan, Aug FY19
Rajasthan	
Mining policy	2015
NGT: Even existing licence holders need to get environmental clearance	Jan FY15
Not clear if manufactured sand can meet demand and quality needs	FY19
"Mining ban give rise to sand mafia"	Oct FY19
SC stays Rajasthan HC order that allowed sandmining at mines with issued LoIs	May FY20
Manufactured sand policy being considered and licences for small plots being allowed	Sept FY19, Jul FY20
Replenishment study of sand mines to be taken up	Aug FY20
Rajasthan HC asks PS (RJ) to issue compounding fee on vehicle – apply consistent approach	Sept FY20
Rajasthan M-sand policy announced	2020
Revised M-sand policy and 27 monitoring teams deployed across the state	2024

D Data collection exercise

D.1 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

TVC counts

Table D.1: 4-day TVC counts at TP1 Sikandra

Date	Toll Plaza	CJV	MLCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total
26-06-23	TP1	11,027	1,297	937	1,303	388	404	3,105	7	**18,468**
27-06-23	TP1	10,281	1,237	1,004	1,293	478	404	3,002	7	**17,706**
28-06-23	TP1	11,585	1,255	1,069	1,269	453	363	3,061	7	**19,062**
29-06-23	TP1	11,843	1,085	994	1,194	506	398	3,075	6	**19,101**

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pvt. Ltd ("the Client"). The report may only be relied upon by Approved Addressees in accordance with the terms of our engagement letter. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data. Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason. While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through February 2026. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Kotwa - Muzaffarpur Tollway Road (hereafter called "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 11 project". This report presents an update of the traffic and revenue forecasts based on actual traffic data available up to February 2026 and latest macro-economic assumptions.

1.2 The Asset Kotwa-Muzaffarpur consists of a single toll road section. For this report, we hereafter call the toll plaza on the Asset as TP1.

- Kotwa-Muzaffarpur Tollway Limited: KMTL: TP1 – Parsoni Khem

Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
• Review of historical Traffic Management System (TMS) data, Vendor reports and documents	• Provided by client for the period between Oct'20 and Mar '26, with FY26 base AADT and forecasts considering data up to Feb'26
• Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	• Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
• Validation of revenue reported in FY26YTD	• TMS data provided by Client • Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
• Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	• Origin Destination (OD) surveys undertaken by a survey agency appointed by Steer. The latest surveys were undertaken in 2026 at the TP.
• Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	• Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis

Scope of work	Data source
• Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors, — Overloading shares	• Calculated from historical data provided by Client
• Final traffic growth forecasts including baseline growth rates and potential future impacts	• Elasticity based base growth and potential impacts from secondary research and Steer's in-house experience of working in the vicinity of the Asset
• Toll revenue estimation for the entire concession, including toll evolution	• Toll evolution based on toll notification published by National Highway Authority of India (NHAI); and latest Wholesale Price Index (WPI) trends as shared by the client

Our approach

1.3 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis focused on two sets of issues, namely:

- understanding the traffic that is currently using the Asset; and
- identifying how and why that traffic is likely to change in the future.

1.4 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
  - TMS data starting October 2020 to February 2026. The historical traffic and revenue presented in Chapter 3 considers information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.
  - Concession agreement and toll notifications for FY25 and FY26
  - Previous studies related to traffic and revenue
  - In previous studies Steer-commissioned OD surveys on 23rd Jan 2025 on the Asset and an additional survey on the 24 Jan 2025 on the SH74 (alternate route) to validate any change in growth drivers and travel patterns.
  - Steer-commissioned three-day TVC survey between 23rd January and 25th Jan 2025 as a part of study.
  - As part of this study Steer-commissioned OD surveys on 14th Feb 2026 on the Asset and TVC surveys from 20th -22nd Feb 2026.
- We undertook revenue reconciliation for FY26YTD, by building up revenue from the traffic reported by the toll plaza and subsequently matched it to the reported revenue for FY26YTD using the prevalent toll rates and reported segmentation/toll-frequencies for FY26YTD, this is a key part of our analysis to validate the segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for each of the toll plaza.

1.5 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against the 11 months of actual traffic (Apr-Feb) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model for each Asset/plaza/toll class to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future.
- Preparing traffic and revenue forecast for the Asset for the complete length of concession. The analysis here includes the specific impacts of network, or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.6 The report has been divided into the following chapters, including Chapter 1 providing an introduction:

- Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
- Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
- Chapter 3 summarises the current and historical traffic trends on the Asset, including results from the TMS, TVC and OD analysis;
- Chapter 4 presents the socio-economic context of India, the corridor and region/state containing the Asset, along with our approach and results on estimating background along with our key forecasting assumptions,
- Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
- Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases

2 The Asset

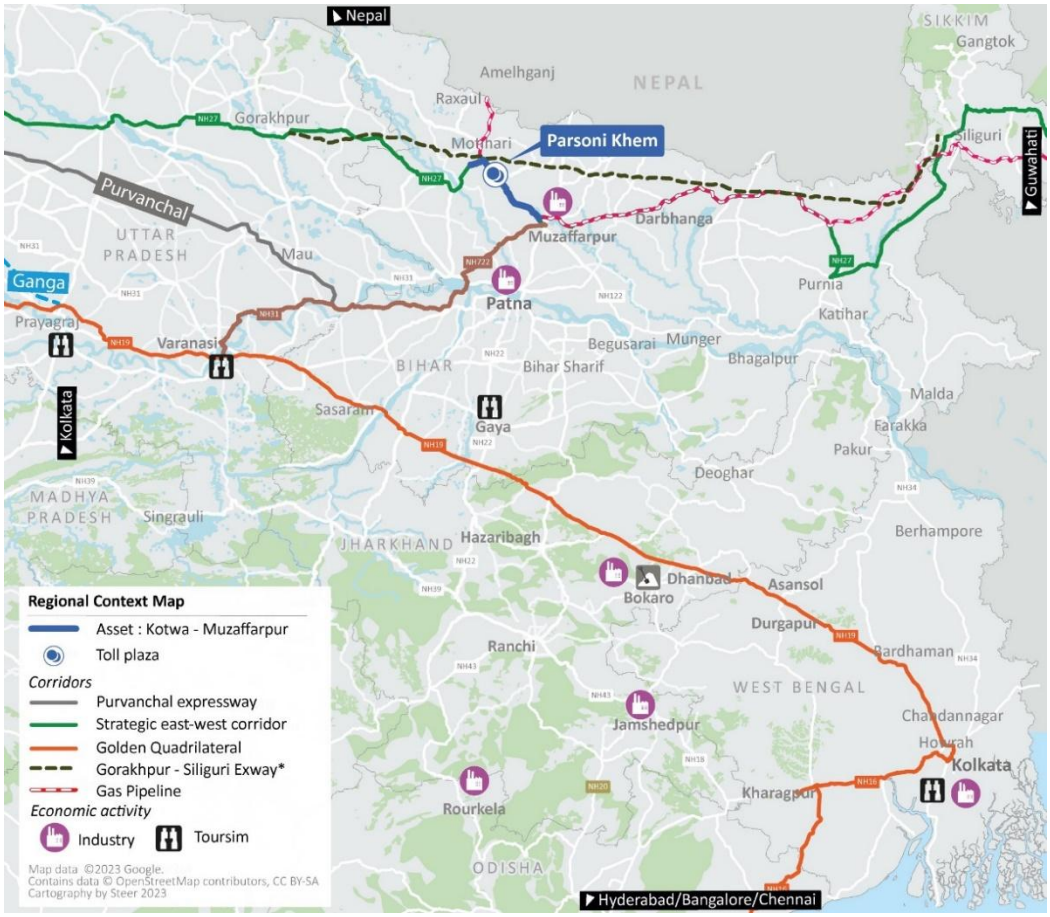
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Bihar, connecting the cities of Muzaffarpur and Kotwa in the north-west part of Bihar. Figure 2.1 below shows the regional road network in which the Asset is located.

Figure 2.1: Asset location in the regional network context



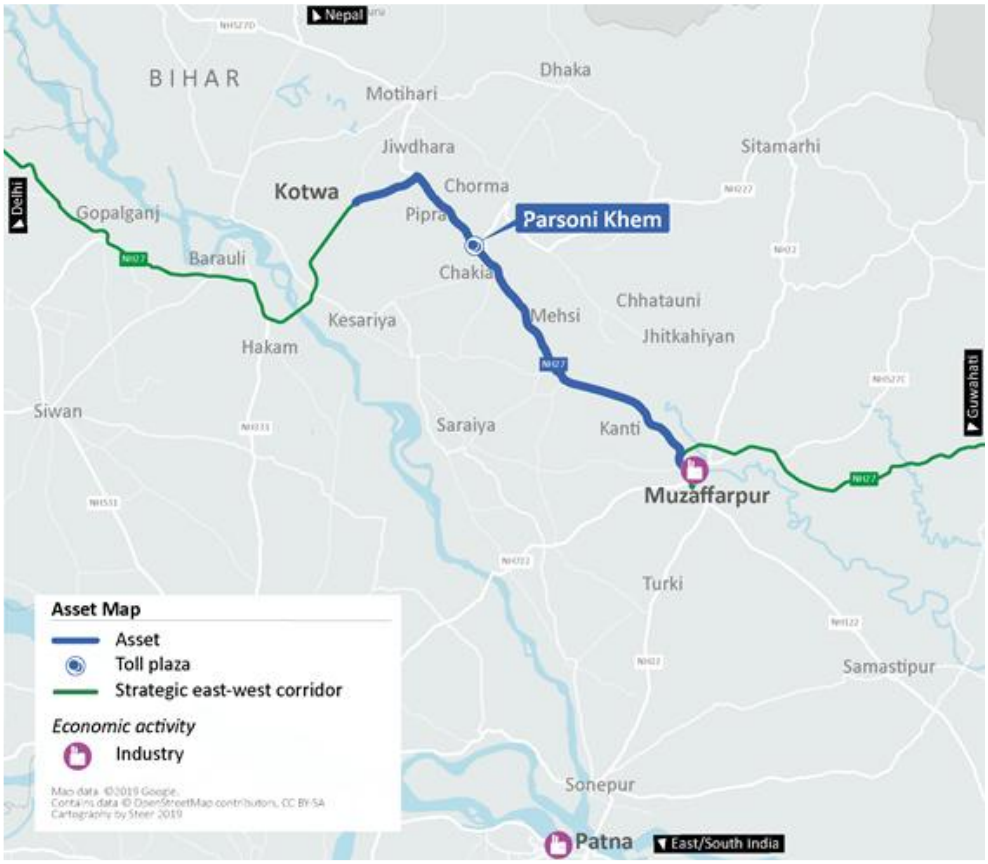
Source: Steer cartography using OpenStreetMap data

2.3 This Asset primarily caters to three different types of strategic movements:

- **Short distance** trips made by cars for local movement between places such as Muzaffarpur, Motihari, Chakia, Motipur and other local destinations mostly for work related purpose.
- **Medium-distance** trips made by light and heavy goods vehicles covering places such as Patna in the southern part of the state and Raxaul near the India-Nepal border thereby catering to the heavy movement of trucks between the two countries for trade purpose.
- **Long-distance** trips made by heavy goods vehicles to provide the east-west connectivity between states such as Uttar Pradesh, Uttarakhand and Delhi, and West Bengal and North-eastern states. The Asset also caters to movement of trucks to countries such as Nepal, Bangladesh and Bhutan.

2.4 The Asset is an 80 km toll road which forms part of the NH 27 in Bihar. It is a four-lane road with one toll plaza, namely, Parsoni Khem (TP1) at Km 467.700 (closer to Kotwa). Figure 2.2 below provides a closer view of the Asset in the context of its immediate surroundings. The Asset lies between the East Champaran and Muzaffarpur districts with Motihari, Chakia, Madhuban, Motipur, Kanti and Muzaffarpur being some of the key settlements along the Asset stretch. It is also located near other traffic generators such as Bettiah, Gopalganj, Patna and Raxual.

Figure 2.2: Asset Context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.5 The toll plaza on the Asset has been operational since December 2012, and the client took over the operations in October 2020. There are still 25 years left from April 2026 in the concession period which ends in FY51. Table 2.1 below presents a summary of the Asset.

Table 2.1: Summary of Concession

Particulars	Details
State	Bihar
Highway and lane configuration	NH 27, four lane
Toll plazas	TP1: Parsoni Khem
Length (km) as per concession agreement, applicable	TP1: 80 km
Commencement of operations	TP1: December 2012
Operated by Client since	October 2020
Concession period	30 years
Last year of concession	FY51

Source: Client data

Figure 2.3 below shows a typical cross-section of the Asset and its toll plazas.

LCV	210
Bus/Truck	440
3A	480
HCM/EME/MAV	690
OSV	840

Source: NHAI Revision of User Fee Rate w.e.f 01 Apr'25

2.6 Apart from single tickets, the typical NHAI ticket categories like return, monthly, local personal and local commercial passes are also available on the Asset.

Key economic activities

2.7 Bihar's economic progress hinges on agriculture, which serves as its fundamental pillar. This sector employs a significant 77% of the workforce and contributes approximately 24.84% to the State's Domestic Product. An estimated 77% of Bihar's population is engaged in agricultural production, a figure considerably higher than the national average. In 2011-12, agriculture, including forestry and fishing, accounted for nearly 24.84% of the state's GDP[1].

2.8 Muzaffarpur situated on one end of the Asset is considered the commercial hub of north Bihar. It is majorly an agriculture and food processing led region with rice as the main crop grown followed by maize. It is also famous for its Lichi and Mangoes which are supplied all over the country. Some of the key large-scale industries in the region includes a thermal power plant in Kanti and Indian Drug Pharmaceutical Limited long with other medium to small scale industries producing biscuits, cloths, flours etc. There is also a food park in Muzaffarpur along with several chemical factories[2].

2.9 In 2025, Bihar Chief Minister Shri. Nitish Kumar laid the foundation stone for development projects worth ₹574.16 crore in Muzaffarpur. These include a Railway Over Bridge (ROB)-cum-approach road between Ramdayalu Nagar and Muzaffarpur railway station (₹167.68 crore), a road from Muzaffarpur-Pusa Road to Chandwara bridge approach (₹120.93 crore) and widening and strengthening of roads such as Chandni Chowk to Bakhri (₹89.77 crore). The initiative also included social welfare measures like increasing pension amounts and incentives for ASHA workers, and support for self-help groups under the Jeevika program.[3]

2.10 In addition to this, In May 2025, the Bihar State Investment Promotion Board approved 18 new industrial units in Muzaffarpur under the Bihar Industrial Policy 2025. These units, located in Bela and Motipur BIADA zones, span sectors such as bakery and food

[1] **Agriculture Department**

[2] As verified during Steer's site visit in 2025

[3] **Muzaffarpur ROB**

processing, plastic bottle manufacturing, organic food products, furniture production, and amusement parks. The projects are expected to generate approximately 10,000 jobs and provide market access to local farmers, especially those engaged in organic agriculture.[4]

2.11 East Champaran district located on the other end of the Asset is largely an agricultural area with presence of small-scale industries like fisheries industry, agro-based industry, and the pearl industry at Mehsi located about 20 km away from the toll plaza. The town of Raxaul, situated about 60 km from Kotwa is India's gateway to Nepal as it's the only point in India which is connected to Nepal through railways. In April 2023, Muzaffarpur got state's second ethanol plant at Motipur in the Muzaffarpur district with a daily production capacity of 110 kl from Maize/Rice.[5]

2.12 Gas Supply is one of the key economic activities of Bihar where the state is witnessing with increased construction of gas and oil infrastructure. In April 2023[6], the remaining portion of Baruni Guwahati Natural Gas Pipeline commissioned by GAIL got completed which connects to six districts of Bihar and further connecting to Assam in north-east. The project was under Pradhan Mantri Urja Ganga (PMUG) with about 729km. With the start of supply the north-eastern states will now be connected to national grid meeting the fuel demand in the region.

2.13 With increasing focus of the government as of 2024 the state with announced with several infrastructure investment which in-turn create positive impact on the traffic performance with increasing demand. In May 2024[7,] 109km Indian Oil Corporation (IOC) LPG pipeline between Muzaffarnagar- Motihari for the benefit of providing cleaner fuel access in the state and also to bordering countries like Nepal. For the same the construction of IOC bottling plant and storage terminal is announced at Motihari. The pipeline would serve 8 districts of North Bihar i.e. East Champaran, West Champaran, Gopalganj, Siwan, Muzaffarpur, Sheohar, Sitamarhi and Madhubani.

2.14 Also to cater the demand of petrol and kerosene in Nepal[89], the Motihari pipeline is announced by Indian Oil Corporation and Nepal Oil Corporation to get extended to Amlekhganj depot which is at Bihar- Nepal border. This is South Asia's first cross border petroleum project pipeline. The infrastructure construction of this ongoing is nearly completed and expected to be commissioned in next few months with its supply to Nepal.

2.15 In 2024 it was announced that the prime minister of India, Shri. Narendra Modi is set to launch initiatives worth ₹4,027 crore in the petroleum and natural sector. This project includes setting up a City Gas Distribution (CGD) network across five districts in Bihar — Darbhanga, Madhubani, Supaul, Sitamarhi, and Sheohar worth ₹3,638 crores by Bharat

petroleum corporation limited (BPCL). This initiative aims at expanding the cities piped natural gas supplies to households and factories alike. In addition, ₹389 crore Bitumen Manufacturing Unit will be set up at Indian Oil's Barauni Refinery to reduce reliance on imported bitumen and meet its rising demand caused by infrastructure developments such as the Bharatmala Pariyojna[10].

Alternate Routes

2.16 SH74 acts as an alternate connection between Muzaffarpur and NH27. SH74 is state highway with towns and villages on route. Providing an attractive alternate option in terms of shorter distance and improved speeds. Vehicles travelling from UP and west towards Northeastern parts of the country such as Siliguri, Assam, Guwahati, etc. may use this alternate route to save time and toll, which they would have to otherwise pay if the use the Asset. In order the use this route, vehicles travelling from UP and east towards Darbhanga and west may enter the alternate route from Rampur Khajuria and travel down, parallel to the Asset where they make the decision at Kesariya to exit from Chakia or exit from Motipur by travelling from Sahebganj.

2.17 As a part of Bharatmala Pariyaojna, 568 km long greenfield Gorakhpur Siliguri Expressway has been approved in 2025[11]. The expressway besides reducing travel time to six hours will boost the inter-state tourism and industrialisation between Uttar Pradesh, Bihar, and West Bengal. The expressway will pass through Gorakhpur in Uttar Pradesh, Gopalganj, Champaran, Kotwa and Muzaffarpur in Bihar and Siliguri in West Bengal. Since the alignment of the expressway runs parallel to the Asset, we believe once operational, trips moving from Uttar Pradesh, Bihar towards West Bengal/Northeast will have an alternate option to use the expressway and impact the traffic moving on the Asset.

2.18 The exact share of such traffic assumed to shift due to alternate routes is presented in detail in Chapter 6 of the report.

3 Traffic Description

Introduction

3.1 This chapter outlines the current traffic and revenue on the Asset, as well as Steer's analysis of origin-destination (OD) data as also traffic count data. This covers data which was collected as a part of this study and data that was provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of demand currently using the Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes and areas of influence in the vicinity of the Asset, and the commodities being moved by goods vehicles. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year Monthly Average Daily Traffic (MADT) is established. This data is typically provided by the Client and independently analysed and validated by us using Traffic Volume Count (TVC) information.

3.4 The below sections present historical traffic and revenue information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.

PCU Factor assumption for reporting

3.5 The PCU values have been taken from 'IRC 64:1990- Guidelines[12] for Capacity of Roads in Rural Areas'. For MAV, based on the discussion with the Client, we have referred to the rigid and trailer splits in the latest TVC counts for calculating the effective PCU for MAVs. For rigid trailer trucks we have assumed a PCU factor of 3, whereas for trailer trucks we have assumed a PCU factor of 4.5. These factors have been used to arrive at the PCU values presented in Table 3.1 below.

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV/Mini LCV	1.0
LCV	1.5
Bus/2A/3A	3.0
MAV*	3.6

[12] IRC 064: Guidelines for Capacity of Roads in Rural Areas (First Revision)

OSV	4.5

Tollable PCU	**21,709**	**19,996**	**20,514**	**20,783**	**21,538**	**22,523**	**3.2%**

Source: Steer analysis of Client data, (FY21* includes 6 months of data from Oct'20 to Mar'21); FY26 includes represents the full year actual (April to March); Tollable AADT excludes exemptions and violations

3.7 Between FY23 and FY26, total traffic grew at a CAGR of 3.4% indicating moderate traffic growth in terms of PCU. In FY26, growth of 5% was seen at a total PCU level which was driven by an increase in CJVs (10.4%), 2A (7.6%), and Bus (8.4%).

3.8 3As experienced a consistent decline since FY23, primarily due to an industry-wide shift of axle configurations towards MAVs. The reduction in 3A volume is a result of the

declining demand for 3A vehicles, which are being replaced by 2A and MAVs. MAVs offer higher tonnage capacity making them more cost-effective for transporters. While the increase in 2A volume reflects the growing preference for these vehicles due to favourable changes in the legal permissible loads for 2As and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. This is consistent with our discussion with various transporters and OEMs across the country who are favouring 2A and 5A vehicles for commodity movement due to better unit economics.

3.9 Furthermore, effective May 2024, minibuses previously tolled as LCVs have been reclassified under the bus category. This reclassification is based on a passenger count system, replacing the earlier gross vehicle weight-based classification. Travel patterns in FY25 and FY26 remain largely consistent.

3.10 As of FY26, about 46% of vehicles on the Asset are cars, which are predominantly used for local travel by commuters between Motihari, Bettiah, Muzaffarpur, Patna and other local destinations along the Asset for purposes such as work, education and medical.

3.11 Heavy commercial vehicle on the Asset constitutes 45% to the total traffic (2A, 3A and MAV) on the Asset, owing to the strategic location of the Asset as a facilitator of east-west movement between northern and eastern parts of India. The Asset provides connectivity between industrial cities of Uttar Pradesh, Uttarakhand, Punjab, Haryana to West Bengal, Bihar and north-eastern states along with providing connectivity with Nepal border at Raxaul, Bihar.

3.12 In FY26, CJVs have the highest share of 46% and are followed by MAVs, which have a share of around 24% in traffic but contribute to approximately half of the revenue generated on the Asset.

3.13 The Asset has experienced subdued growth in the goods vehicle category, due to several factors including reduced trade with Nepal due to ongoing economic and political changes in Nepal. Additionally, the near completion of the Motihari - Amlekhganj pipeline, connecting Bihar to Nepal, has resulted in a shift of petroleum and oil transportation from road to pipeline, contributing to a decline in goods traffic[13].

3.14 The high growth observed in CJVs, Buses, and 2As is also attributable to a low base effect as in FY25, overall traffic growth was impacted during Q1 of FY25 due to nationwide general elections.

3.15 FY26 performance indicates recovery in traffic with MAVs growing by 4% and healthy growth of over 10% observed in CJVs. Buses in the region have also seen a significant growth of over 8%, while 3As continue to decline.

Historical Revenue

3.16 Table 3.4 shows the revenue (in INR Crores) and AADC (in INR Lakhs) by each vehicle type at the toll plaza between FY21 to FY26.

[13] **Motihari-Amlekhganj Petroleum Pipeline Project: Preparations to bring petrol thru pipeline in three months**

Table 3.4: Total Revenue (INR Crores) by vehicle type at TP1 Parsoni Khem, and AADC (average annual daily collection in lakhs)

FY	CJV	LCV	Bus	2A	3A	MAV	OSV	Total	AADC	AADC Growth
FY21*	5.4	1.5	3.3	5.6	6.4	21.7	0.0	**44.0**	**26**	-
FY22	10.4	2.4	6.0	12.1	13.7	45.8	0.0	**90.4**	**25**	**(3.8%)**
FY23	12.3	2.8	4.8	14.6	16.0	51.8	0.1	**102.2**	**28**	**12.0%**
FY24	13.9	2.8	4.6	15.7	16.7	55.6	0.1	**109.4**	**30**	**7.1%**
FY25	15.1	2.4	6.1	17.0	16.2	58.4	0.0	**115.3**	**32**	**5.7%**
FY26	16.5	2.9	7.2	19.3	16.8	63.3	0.4	**126.5**	**35**	**9.7%**

Source: Steer analysis of Client data, (FY21* From Oct-20 (last 12 days) to Mar-21; AADC represents Average Annual Daily Collection; FY26 represents full year actual (April to March).

3.17 MAVs are the highest revenue contributor on the Asset with approximately 51% share in FY26. CJVs which have the highest share in traffic, contributing to approximately 13% in terms of revenue in FY26. The average daily revenue collected at the toll plaza has been approx. INR 34.6 lakhs in FY26 compared to approx. INR 29.9 lakhs in FY24.

Toll Frequencies

3.18 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy which forms a part of the concession agreement. Each vehicle category has different segmentation. As a part of historical analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the client. The most common ticket categories observed on a typical National Highway are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these passes instead of evading toll.

3.19 The following are the types of tickets being sold at the plazas of the Asset.

Table 3.5: Typical ticket types sold at NHAI plazas

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows for a return journey within a day with a 50% discount on the return trip.
Monthly Pass	Discounted single entry ticket for users who undertake multiple trips within a month can buy the monthly pass.
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.20 Further, the toll plazas also record violations which are non-paying users, who are not officially allowed under exemptions category but are forced exemptions. For some Assets, the Exemption and violations are at time reported together.

3.21 Generally, over the period the shares of single/return/monthly tickets tend to stabilise within 2-3 years of Asset operations. Only in the cases where trip patterns are expected to change significantly due to urban expansion is where we expect these shares to change over the period or due to some external events impacting the trip patterns.

Introduction of Annual pass for CJVs

3.22 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.23 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag.

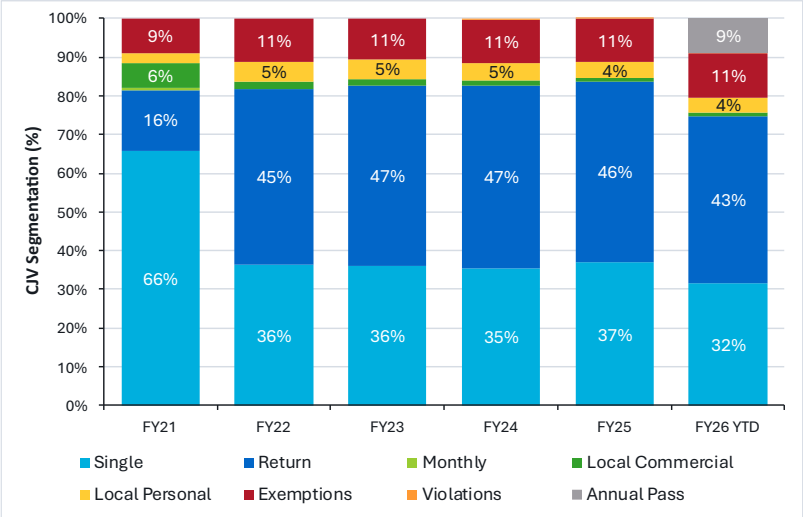
The Annual Pass aims to:

- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls
- Provide cost-effective travel for frequent users of NH/NE toll roads

Share of traffic by payment type

3.24 Figure 3.1 and Figure 3.2 below show ticket segmentation for CJV and MAV categories, between FY21 to FY26YTD for the Asset.

Figure 3.1: Ticket-segmentation for CJV at TP1

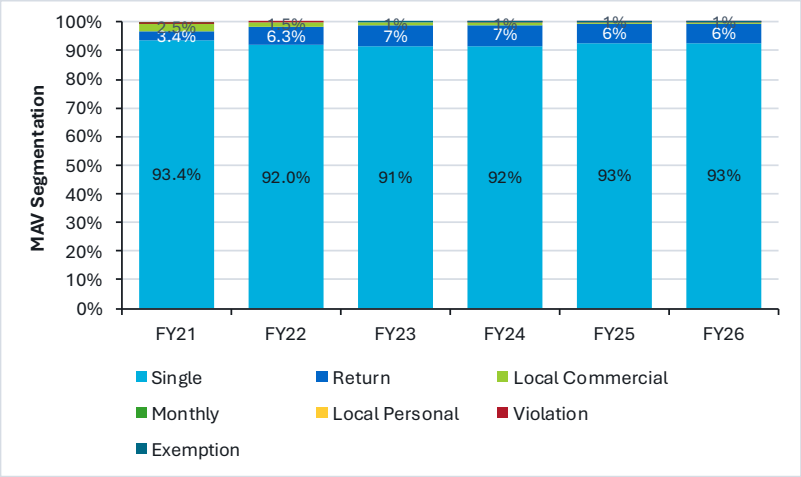


Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26 YTD* considers Apr'25-Feb'26

3.25 The introduction of annual passes for private CJVs from 15 August 2025 has impacted the ticket segmentation of CJVs. While exemptions and local personal trips have remained at

the same levels as FY25, it can be observed that the share of single and return trips have reduced.

Figure 3.2: Ticket-segmentation for MAV at TP1



Source: Steer analysis of Client data (FY21 has data for Oct-20 to Mar-21); FY26YTD includes Apr'25- Feb'26

3.26 In FY26YTD, MAV category has been observed to have high share of ~93% single tickets which is aligned to the observation of MAVs doing medium to long distance trips on the Asset between North- East states, Bangladesh, Nepal and West Bengal. As discussed and validated from the OD data. A slight increase in return tickets post-FY21 is visible due to implementation of FASTag, allowing trucks to avail return journey discounts, if they return within 24 hrs.

3.27 Table 3.6 below depicts the FY26YTD segmentation for LCV, Bus, 2A, 3A and OSV category for the Parsoni Khem toll plaza.

Table 3.6: Ticket-segmentation for LCV, Bus, 2A and 3A Categories at TP1 Parsoni Khem

Ticket Category	LCV	Bus	2A	3A	MAV
Single	54%	31%	73%	88%	92.8%
Return	41%	63%	23%	9%	6.5%
Local commercial	1%	3%	3%	3%	0.5%
Violation	0%	0%	0%	0%	0.0%
Exemption	4%	2%	1%	1%	0.2%

Source: Steer analysis of Client data; FY26YTD includes 06 months Apr-Feb'26

3.28 The share of return in LCV/Bus is higher compared to 2 Axle trucks attributing to the fact that they make shorter distance local trips while 2A having higher average trip length has higher share of single trips. This has been discussed in detail in the subsequent sections.

Data Collection exercise

3.29 As mentioned previously, to validate and inform various inputs used in our earlier forecasting, we undertook OD data collection on the Asset in this study, comprising the surveys listed in the table below. While TVC surveys were commissioned by Steer by contracting a third party in the study of our earlier commission. OD data collection

typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data is comprehensive; where collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.7: Data collection schedule

TP	3-day videography-based TVC			1-day OD survey			
	Start date	End date	Time (hrs)	Start date	Start time	End Date	End time
TP1 Parsoni Khem	20th Feb 2026	22nd Feb 2026	0000-2359	14th Feb 2026	0800 hours	15th Feb 2026	0800 hours
SH-74	23 Jan 2025	25 Jan 2025	0000-2359	24th Jan 2025	0800 hours	24th Jan 2025	0800 hours

Source: Steer analysis

3.30 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic counts are generally recommended, and hence, to fully understand the impact of this weekly fluctuation on the Asset, we collected three-day counts at the toll plaza and the alternate route mentioned in the table above.

Key findings of the TVC data analysis

WADT estimates

3.31 Taking an average of the three-day TVC counts (20th Feb – 22nd Feb 2026, 0000-2359), we obtained the following average daily traffic (ADT). This ADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Table 3.8: ADT from TVC counts

Location	CJV	Mini LCV	LCV	Bus	2A	3A	MAV	OSV	Total
Parsoni Khem	4,763	1,064	979	602	1,063	1,082	2,739	3	**12,296**
SH74 (Alternate Route)	1,209	516	255	131	128	86	704	0	**3,029**

Source: Steer analysis of TVC data

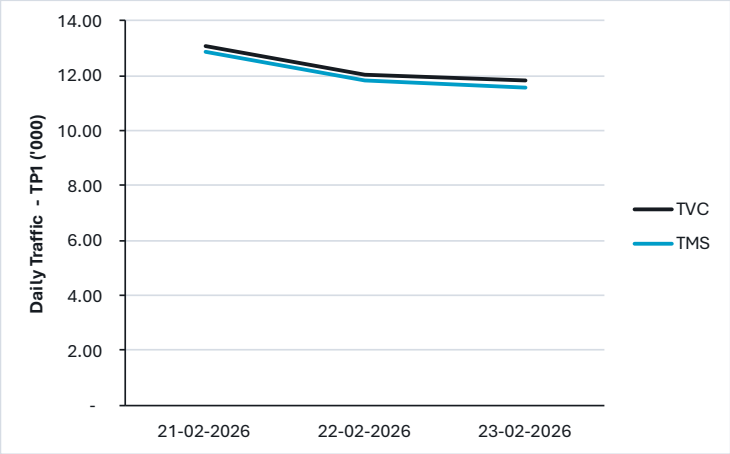
TVC v/s TMS analysis

3.32 As we use the TMS data to estimate the base year MADT, we have used our TVC data to validate the TMS data for those days, as provided by the Client.

3.33 Figure 3.3 below show the comparison between the daily traffic observed by TVC and TMS for the two toll plazas.

Parsoni Khem

Figure 3.3: Comparison between TVC and TMS total daily traffic data on TP1 Parsoni Khem

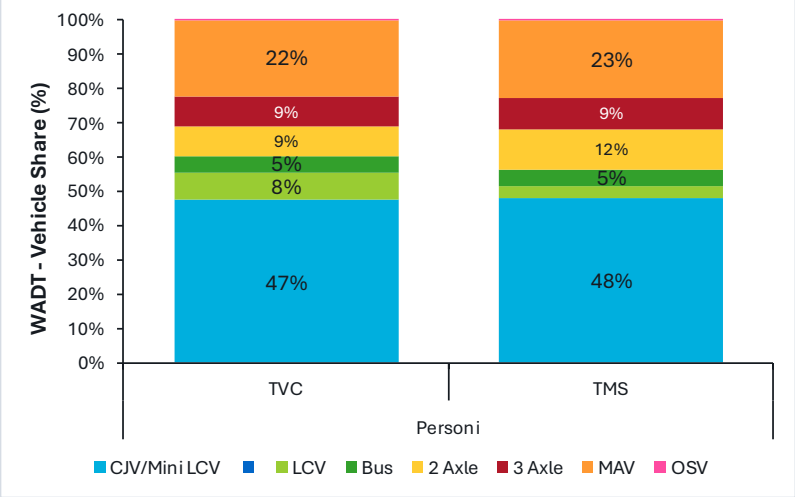


Source: Steer analysis of TVC and Client TMS data

3.34 Figure 3.3 shows that the total WADT count as provided by TVC data is c.1% higher than those reported by the TMS data. Since, the difference is minimal, the TMS data has been used to build up FY26 base traffic and forecasts without any adjustments for unreported exemptions.

3.35 Figure 3.4 compares the shares of vehicle types as observed through the TVC and TMS data. As can be seen, whilst the share of CJVs is higher in TVC data, share of LCVs and Bus is lower. These differences can be attributed to misclassification of vehicle categories.

Figure 3.4: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.36 Considering the variation between the TVC and TMS data is ~1%, TVC-TMS analysis gives us confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

Key findings of origin-destination analysis

Overview

3.37 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. We have analysed the regional drivers of demand based on the following analyses:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.38 While zonal analysis and the list of top OD pairs help to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported. Trip length distribution show 'how far' vehicles and people travel, and goods get transported. This set of analyses is generally used to estimate the key drivers of traffic and aid the making of informed forecasting assumptions around traffic demand elasticities, growth drivers and exogenous impacts

3.39 OD surveys were conducted at two locations along the alternate route SH74—Sahebganj and Benipur—to assess the volume and nature of traffic using this corridor. The objective was to identify the extent to which traffic that would otherwise use the Asset is instead traversing the toll-free SH74, which also offers shorter travel time.

Sample rates

3.40 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples by the TVC count observed on the same date for each vehicle category at the toll plaza. Table 3.9 below presents the sample rates for goods and passenger category at the toll plaza. We believe that the sample rates of the OD data are reasonable for the analysis required.

Table 3.9: sample rates for OD data

Vehicle type	TP1 Parsoni Khem
Passenger (CJV+Bus)	45%
Goods (LCV+2A+3A+MAV)	62%

Source: Steer analysis of OD data

Zone Categories

3.41 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states and regions in the vicinity of the Asset, we have aggregated zonal data as described in Table 3.10 below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Asset being studied.

Table 3.10: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.

Aggregate Zone	Description
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Delhi	Delhi NCR
North India	Uttarakhand, Haryana, Punjab, Jammu and Kashmir
Central India	Madhya Pradesh, Chhattisgarh
West India	Gujarat and Maharashtra
South India	Tamil Nadu, Karnataka, Kerala, Andhra Pradesh
East & Northeast India	West Bengal, Orissa, Jharkhand and Northeast Indian states
Outside India	Nepal, Bhutan, and Bangladesh

Source: Steer analysis

Zonal influence

TP1 Parsoni Khem

3.42 The zonal influence is the contribution of the zone or the zonal aggregation to trips by a vehicle type. This section presents the zonal influence at each toll plaza of each Asset, based on zonal aggregation listed in the previous sub-section.[14] It should be noted that zonal influence is analysed on trips ends and not overall trips. E.g., 14% local share in Cars as shown in Figure 3.5 below means 14% of the Cars using the Asset have either originated or destined locally i.e within 20kms of the Asset radius.

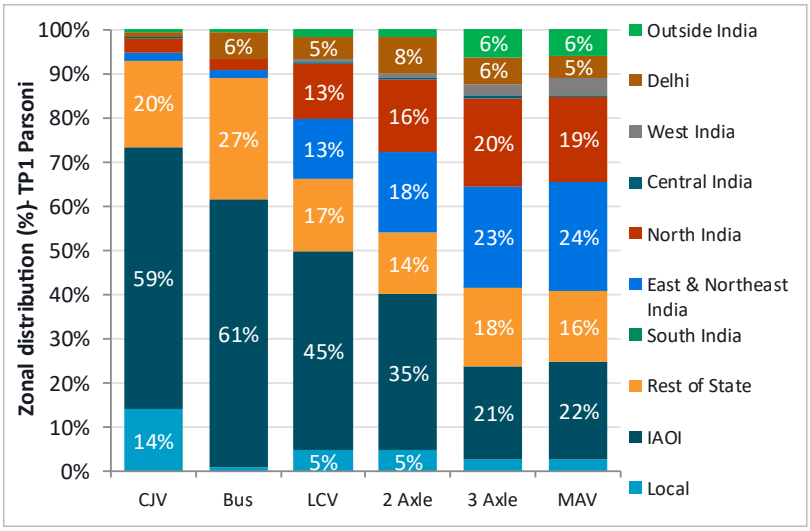
3.43 As can be seen from the figure below, local and IAOI make more than 25% trip share across all vehicle categories wherein zones such as Motiput, Madhuban, Kotwa etc. have the greatest influence across all vehicle categories. The influence of local and IAOI is 50% in LCVs as compared to ~40% for 2 Axles and ~25% for 3 Axles, signifying that LCVs generally cater to local demand and travel shorter trip lengths as compared to 2 Axles and 3 Axles. Local, IAOI and Rest of the State trips are observed in the highest percentage in the Bus and CJV category – accounting for more than 60% of all trips. This analysis is further supported by the result of the top 10 OD pairs as given in the appendices which shows that the majority of the trips originate and end in local and IAOI areas for passenger traffic whereas for the goods traffic, places such as Nepal, Assam, West Bengal and Uttar Pradesh feature at the top of the OD pair list.

3.44 Outside Bihar, it is seen that places in North India such as Delhi, Kanpur, Gorakhpur, and parts of Rajasthan, and those in East & Northeast India like Siliguri, Guwahati, Kolkata and Assam have a significant influence of around 40% on the heavy goods traffic thereby highlighting that the Asset plays an integral part in catering to the long-distance movement of traffic. There is also an influence of 6% each for 3A and MAVs respectively

[14] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

from areas outside the country such as Nepal signifying the importance of the Asset in international trade as well.

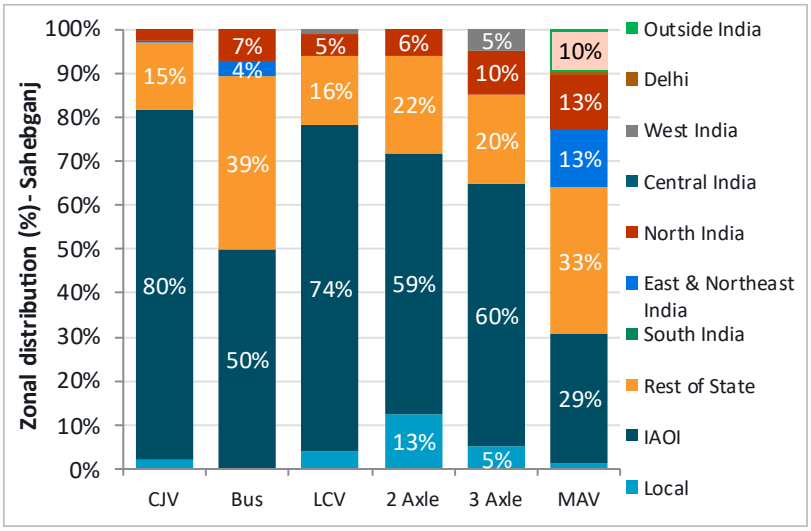
Figure 3.5: Zonal influence at TP1 Parsoni Khem



Source: Steer analysis of OD data from Feb'26

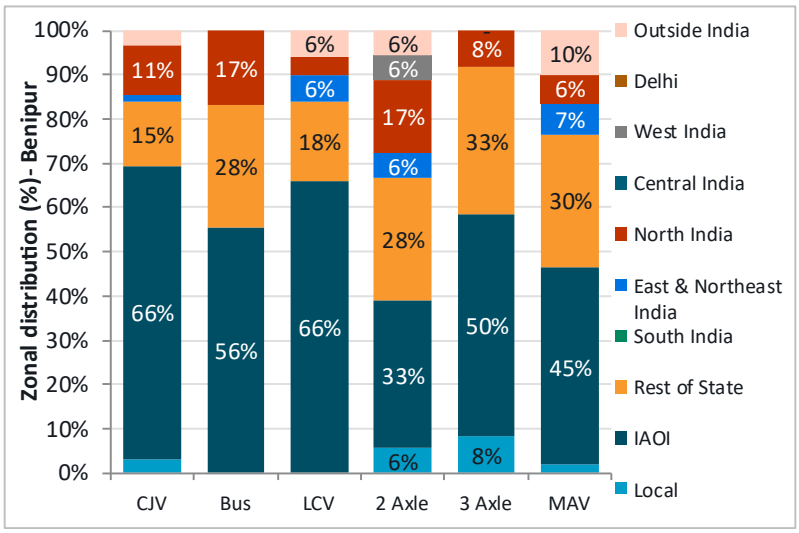
SH74 (Alternate Route)

Figure 3.6: Zonal influence at Sahebganj (Open OD)



Source: Steer analysis of OD data

Figure 3.7: Zonal influence at Benipur (Open OD)



Source: Steer analysis of OD data

3.45 As can be observed in Figure 3.6 and Figure 3.7 the zonal distribution analysis reveals that both Sahebganj and Benipur are dominated by IAOI zones, especially in commercial vehicle categories like LCVs, 3-Axles and MAVs. However, Sahebganj shows a stronger concentration of IAOI traffic, while Benipur sees a more diverse mix, including higher shares from North India and Delhi. Local traffic is minimal at both locations. Both plazas register notable movement from the "Rest of State" and around 10% of MAV traffic from Outside India, indicating cross-border trade with Nepal for POL goods.

3.46 Further analysis of the open OD data reveals that for 3-axle vehicles and MAVs, top origins and destinations on Sahebganj include Patna, parts of East Champaran, West Bengal, Nepal, as well as cities in Uttar Pradesh and Jharkhand. Meanwhile, Benipur sees traffic primarily between East Champaran, Patna, Jharkhand, and Nepal. This travel pattern suggests that State Highway 74 (SH74) draws a significant portion of traffic from our Asset due to the absence of toll plazas and the superior road quality.

Internal External analysis

TP1 Parsoni Khem

3.47 Internal-External analysis helps in identifying the trips which have both the origin and destination on or near the Asset i.e local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). Rest of State here represents areas within the state which are neither local nor IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e. lying on the Asset, while 'External' zones are areas lying outside the state.

3.48 Figure 3.8 shows the distribution of trips based for MAV. Understandably, these reflect the observations seen in the zonal influence presented earlier, at a higher level of aggregation.

3.49 The long-distance nature of the MAV traffic is reflected in this analysis as around 39% of the trips for MAV are originating and ending in areas lying outside the state. These are the

trips predominately travelling between north India and east India. Overall, 54% of MAVs plying on the Asset have at least one of the trips ends outside state.

Figure 3.8: Internal-external distribution at TP1 Parsoni Khem

	Internal	Rest of State	External
External	13%	11%	39%
Rest of State	4%	3%	7%
Internal	9%	6%	8%

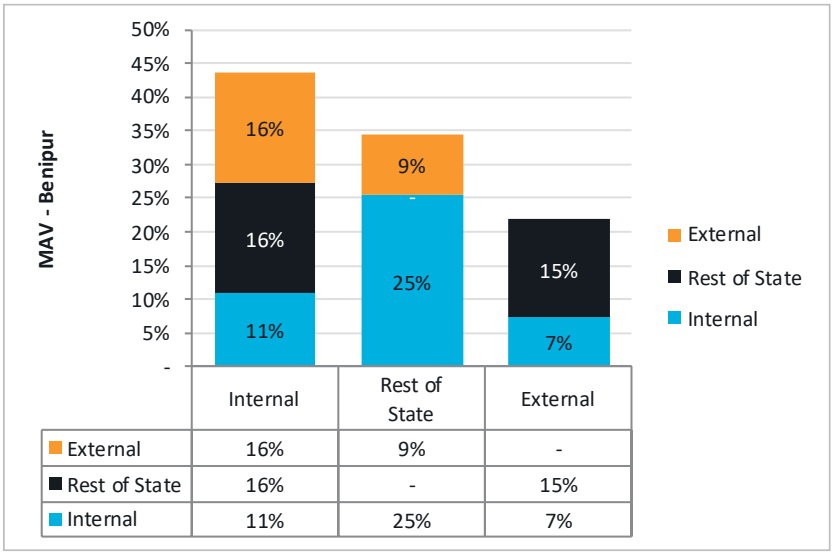
Figure 3.10: Internal-external distribution at Benipur



Source: Steer analysis of OD data

3.50 Figure 3.9 and Figure 3.10 illustrate the distribution of MAV trips from alternate OD sites. This analysis highlights the long-distance nature of MAV traffic, with approximately 41% of trips originating or ending externally at Sahebganj. Conversely, Benipur plaza experiences more internal and intra-state trips, suggesting shorter trip lengths.

Commodity distribution

3.51 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in the table below. The charts in the following sub-section present information in terms of aggregate commodity categories.

Table 3.11: Commodity categories

Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, ghoat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cool drinks, beer etc.)	GRO	
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN

Commodity Description	Code	Combined codes used for charts	
Raw Wood, Cork & Wood Products, Furniture		WUD	
Machinery / Spare parts		MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)		AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)		MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)		MIN	
Empty		EMT	EMT
Container		CTR	MSC
Miscellaneous (Parcel, Courier, Household items etc.)		MSC	
Passengers		PAS	
Scrap		SCR	

Source: Steer Analysis

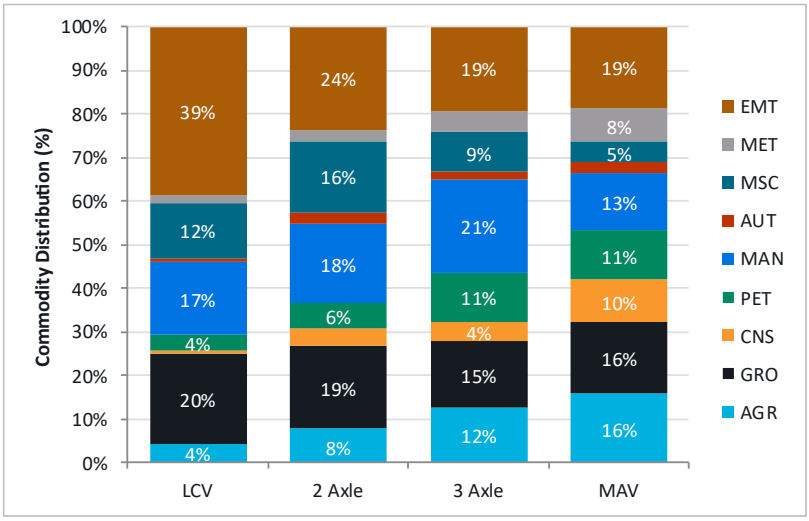
TP1 Parsoni Khem

3.52 Figure 3.11 presents the commodity distribution for goods vehicles at the toll plaza, at a total level.

3.53 Agricultural and grocery items such as rice, wheat, maize, and sugarcane are the top commodity category carried by both 3A and MAV traffic with combined share of 27% and 32% respectively. Both the ends of the Asset being heavy agri -based with the dominance of commodities such as rice and sugar. This was followed by 11% each, of the 3As and MAVs transporting petroleum products like oil, gas, and petrol. This is due to the presence of the Barauni refinery near the Asset. Manufacturing items (such as clothes, paper and rubber) too are observed in notable quantity in both 3A's and MAVs, account for approx. 21% and 13% vehicle split respectively.

3.54 The light goods vehicle shows a similar mix of commodities with agricultural and grocery items having ~24% share, followed by manufacturing and miscellaneous goods. Many industries are in Muzaffarpur contribute to the high share of manufacturing and finished commodities carried on the Asset.

Figure 3.11: Commodity distribution at TP1 Parsoni Khem (Total)



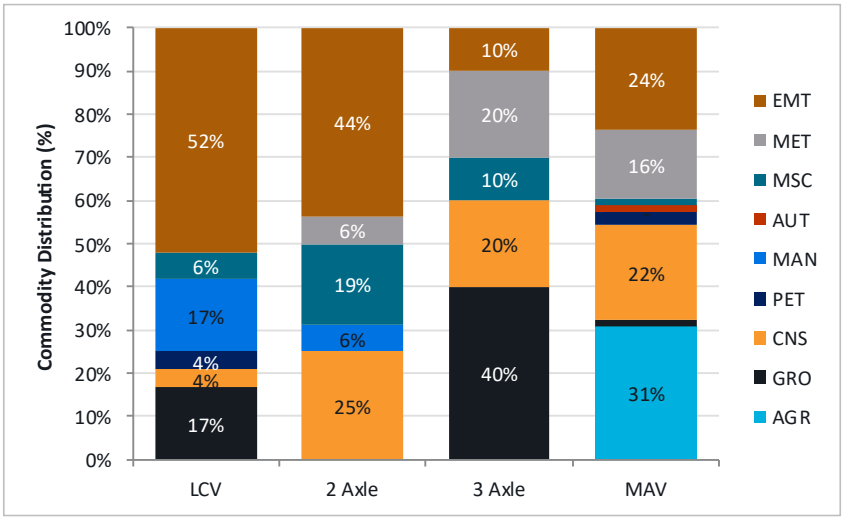
Source: Steer analysis of OD data from Feb'26

SH74 (Alternate Route)

3.55 The distribution of commodities transported by 3-Axle and MAV vehicles at the alternate route points—Sahebganj and Benipur—reveals distinct trends. At Sahebganj, 3-Axle trucks predominantly carry Grocery items (40%), followed by Construction materials (20%), Metals (20%) and Miscellaneous goods (10%). In contrast, MAVs at the same location exhibit a more diverse cargo mix, with Agricultural products (31%), Construction materials (22%) and Metals (16%) making up the bulk of their loads.

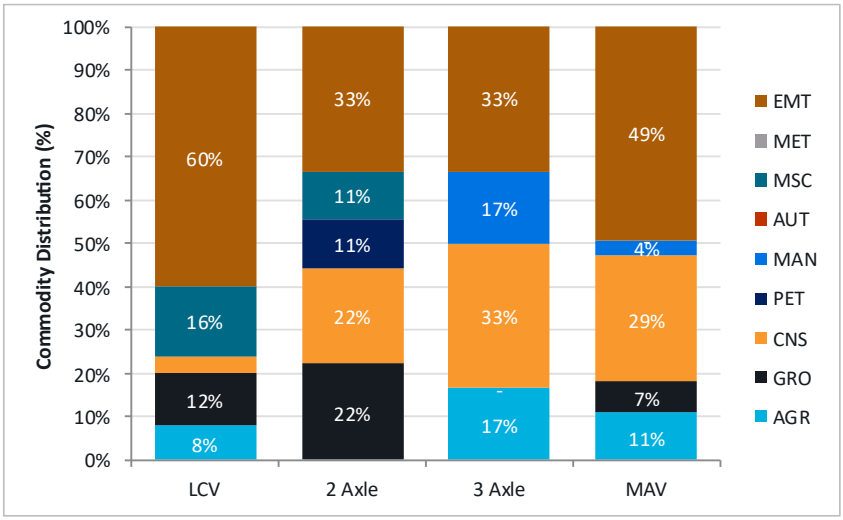
3.56 Benipur, on the other hand, shows a stronger emphasis on Construction materials, which account for the largest share for both 3-Axles (33%) and MAVs (29%). 3-Axles also carry significant proportions of Manufactured goods (17%) and Agricultural products (17%).

Figure 3.12: Commodity distribution at Sahebganj (Total)



Source: Steer analysis of OD data

Figure 3.13: Commodity distribution at Benipur (Total)



Source: Steer analysis of OD data

Trip length analysis

3.57 Trip-length distribution provides the distance-based profile of various vehicle types. This aids in validating the assumptions around the share of macro-economic drivers, inputs from zonal influence and toll segmentation. For the ease of interpretation, we have categorised distances into 5 groups:

- Local (0-100km)
- Short distance (100-300 km)
- Medium-distance (300-500 km)
- Long-distance (500-1000 km) and
- Very-long-distance (+1,000 km)

3.58 The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs[15].

TP1 Parsoni Khem

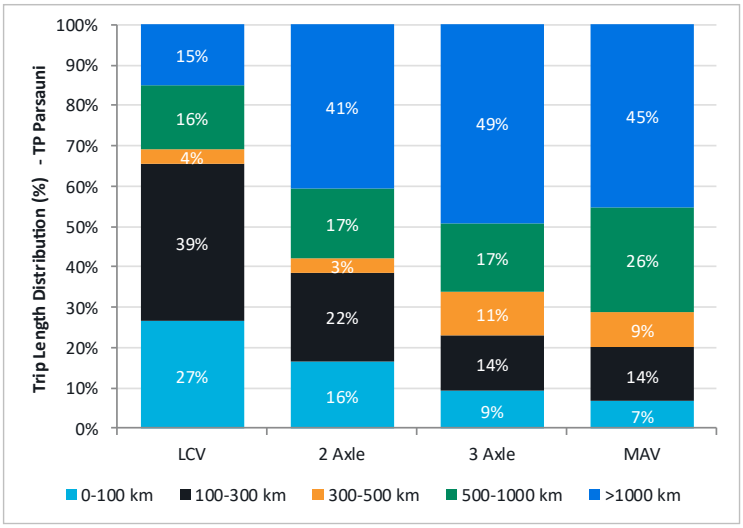
3.59 Supporting the observations made in zonal & internal-external analysis in the previous sections, Figure 3.14 below highlights that about 66% of LCVs travel shorter distances up to 300 kms, contributing to within state movements on the Asset. In case of LCVs around 39% of category travel less than 300 but more than 100 kms catering to the local demand carrying agricultural and groceries. It can be seen that as the number of axles increase, the distances travelled also increase.

3.60 As established by the internal-external analysis and the zonal distribution analysis above, the Asset caters to the long-distance movement for a significant proportion of commercial traffic evidenced by 66% of 3A trips and 71% of MAV trips travelling more

[15] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc

than 500kms. These trips primarily move from North India (Delhi NCR, Punjab, Haryana, Rajasthan and UP) towards Bihar, West Bengal and north-eastern states.

Figure 3.14: Trip length distribution TP1 Parsoni Khem



Source: Steer analysis of OD data from Feb'26

Table 3.12: Average trip length (in km) at TP1 Parsoni Khem

	LCV	2 Axle	3 Axle	MAV
Average trip length Km	640	902	1,086	1,073

Source: Steer Analysis of OD data from Feb'26

SH74 (Alternate Route)

3.61 The trip length distribution shows that Sahebganj mainly serves short to medium hauls for 3-Axles (67% in 100–300 km) and a balanced mix for MAVs, with 35% in 500–1000 km and 28% in 300–500 km ranges. In contrast, Benipur supports longer-distance travel, with MAVs at Benipur have a strong long-haul profile, with 40% in 300–500 km and 8% above 1000 km, indicating more through and extended regional movement. These validate the alternate routes usage for long distance traffic movement for commercial vehicles.

Conclusions

3.62 In summary, as per the traffic volume data in FY26, CJVs contribute to the highest share in traffic around 46% followed by 2A, 3A, and MAVs which combined form approx. 45%. Even though CJVs make up for the highest share in traffic, MAVs are the biggest revenue contributor.

3.63 The TVC-TMS analysis highlights minor variation between the two datasets wherein at the total level, TVC is approximately 1% higher than the TMS data wherein the differences in LCV, CJV/MLCVs and 2A's contribute to the delta, which could be due to mis-categorisation of Mini LCV and LCV with Mini LCV's getting counted into CJV's. However, the difference is minor for the larger revenue generating categories (3A, MAV, and OSV combined) at (0.5%).

3.64 The zonal influence analysis examines the contribution of different zones to vehicle trips. Local and IAOI zones account for over 25% of trips across all vehicle categories, with Motiput, Madhuban, and Kotwa having the highest influence. Among commercial vehicles, LCVs show the strongest local influence at 61%, compared to ~40% for 2 Axles and 25% for 3 Axles. CJV traffic has the highest local and IAOI share at 73%.

3.65 For heavy goods vehicles (3As and MAVs), zones within Bihar account for about 40% of all trips on the Asset. Apart from these trips, it is observed that zones in Northern India (including Delhi NCR, parts of Rajasthan etc) and Northeast India (Assam, Guwahati and Siliguri) have significant influence, establishing the Asset as a key corridor facilitating movements between north and northeast parts of the country.

3.66 Internal external analysis reflects the long-distance nature of traffic on the Asset with approximately 54% of all trips either originating and ending in zones outside Bihar.

3.67 Commodity distribution reveals that agricultural and grocery items (rice, wheat, maize, sugarcane) dominate 3A and MAV traffic, with a 27% and 32% share, respectively, due to strong agricultural activity at both ends of the Asset. Petroleum products (oil, gas, petrol) account for 11% of MAV and 11% of 3A traffic, influenced by the nearby Barauni refinery. Manufacturing goods (clothes, paper, rubber) also have a notable presence, making up 21% of 3A and 13% of MAV traffic. Light goods vehicles (LGVs) follow a similar pattern, with agricultural and grocery items (~24%) leading, followed by manufacturing and miscellaneous goods, supported by Muzaffarpur's industrial base.

3.68 Our analysis indicates that the alternate route SH74 carries commercial traffic moving between Uttar Pradesh, Patna, Nepal, Jharkhand, and other parts of eastern India. The route competes directly with the Asset due to the absence of toll plazas and the superior road quality of the alternate.

3.69 Analysing the vehicle share on the Asset and understanding the OD analysis, CJVs make up for the highest share of traffic and significantly contributed to the local traffic share, however the largest contribution to the revenue share is made by MAV and 3A traffic,

wherein agriculture and groceries are the top commodity category transported on the Asset by both the heavy and light goods vehicles.

4 Socio economic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the roads are in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions in the region where the Asset is located and the country. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Asset.

4.2 In turn, the change in the relative competitive position of the Asset (and thus of the traffic capture they can achieve) derives from how the relative offer for the roads changes, i.e. the service offered, and the tolls charged on the project roads, in comparison to that on competing roads; and whether any competing road facilities are planned.

4.3 In this chapter, we have assessed the trends of the above growth drivers, as indicators of the socio-economic conditions in the regions surrounding the Asset.

Population growth

4.4 We have analysed the key socioeconomic drivers of the background traffic demand in the Bihar state, where the Asset is located.

National level

4.5 The total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in Table 4.1below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 - 1985	2.3%	1.9%	3.8%
1985 - 2000	2.0%	1.7%	2.9%
2000 - 2015	1.5%	1.0%	2.6%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2015 – 2030*	1.0%	0.3%	2.3%
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth.

State level

4.6 The Table 4.2 shows the evolution of population in Bihar state compared to that of the country. Overall, as can be seen, the trend observed at the country level is also noticeable at the state level, namely, a move towards urban agglomeration with the growth in rural population being slower than that of urban population. Further, the population of Bihar has grown at a higher rate than the country average between 2012-2024.

Table 4.2: Population Growth in India (2012 – 2024)

State	2012 Population (m)	2024 Population (m)	CAGR (2012 – 2024)
Bihar	105.1	127.9	1.7%
India	1,210	1,395	1.2%

Source: Ministry of Statistics and Program Implementation estimates

4.7 Due to the complexities of the patterns in which urbanisation takes place, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide a socio-economic context of the trend in the region in which the Asset is located.

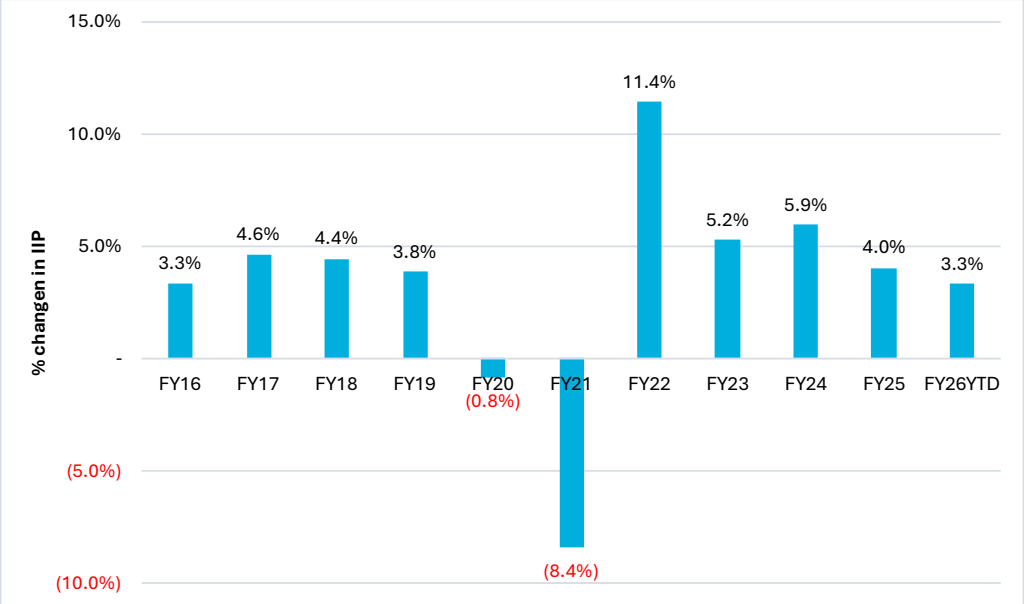
Economic Indicators

Industrial Production

4.8 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors in which IIP constituents fall.

4.9 The figure below shows that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4%, and FY26YTD (till February 2026) recording 3.3% growth over FY25

Figure 4.1: Annual growth – Index of Industrial Production (FY16-FY26YTD)



Source: Ministry of Statistics and Program Implementation (MoSPI). FY26YTD represents data till Feb'26

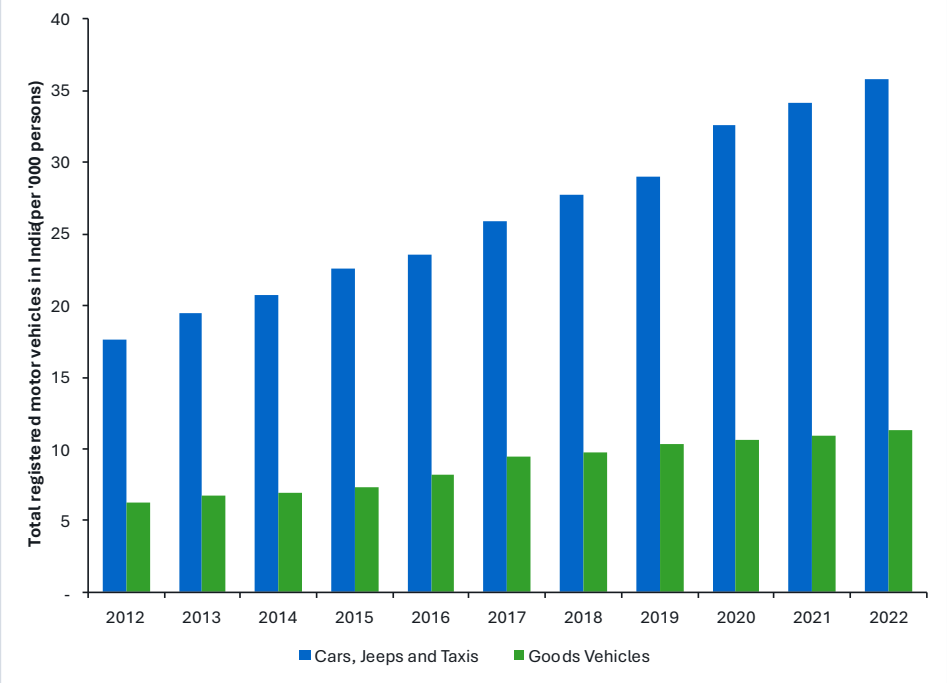
4.10 Since state-level IIP data is not as readily available as national-level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MoSPI, RBI or through multilateral organisations like WB, or the IMF.

Vehicle ownership

4.1 The gap in car ownership between India and developed nations remains substantial – with 36 cars/jeeps/taxis and 11 commercial vehicles per thousand people, as of FY22 (the latest year for which official data is available). However, with increasing per capita income levels, a booming economy and the subsequent increase in demand for mobility, the number of registered vehicles has been on a gradual upward trend

4.2 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. Between FY12 and FY22, the CAGR for CJV and goods' vehicles registered in India was 8.6% and 7.3% respectively

Figure 4.2: Total number of registered motor vehicles in India (per 1000 population

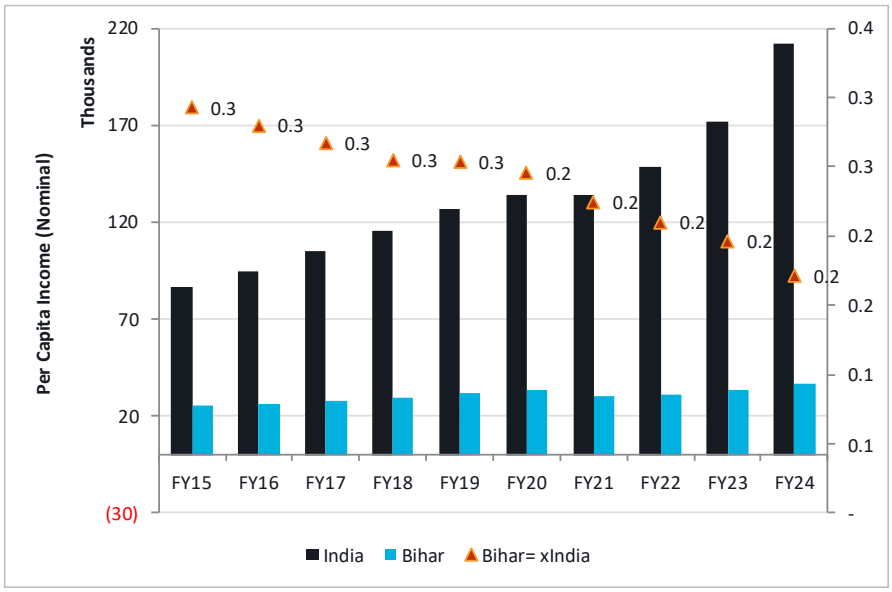


Source: Ministry of Road Transport and Highways (MoRTH)

Per Capita Income (PCI)

4.3 The per capita income of the state where the Asset lies, i.e., Bihar is lower compared to the national average. Thus, the state is at a very early stage of consumption curve. Going forward, we therefore expect local consumption to be strong which would drive the growth in both passenger and commercial traffic.

Figure 4.3: Per Capita Income



Source: Ministry of Statistics and Program Implementation (MoSPI)

4.4 Given the difficulty in obtaining granular district level PCI data, it is not advisable to use this as a growth driver in our forecasts. Additionally, long-term forecasts for PCI are not available from official sources and we therefore refrain from using it to forecast traffic growth.

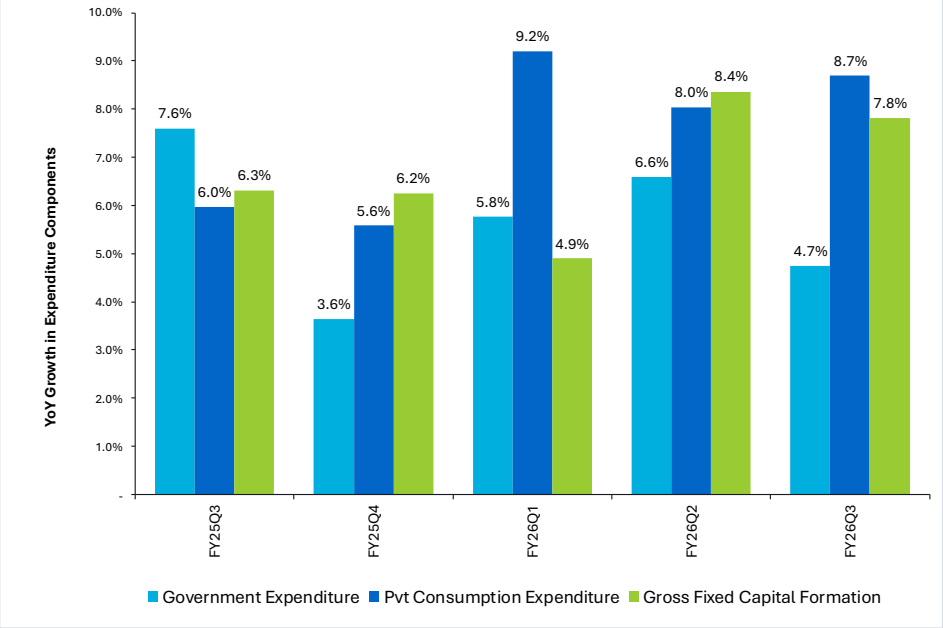
Economic growth

India's Performance

4.5 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q3 GDP at 7.8% over FY25Q3. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[16].

4.6 The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past year (FY25Q3-FY26Q3).

Figure 4.4: YoY growth in expenditure components of GDP



Source: Steer Analysis of MOSPI Data

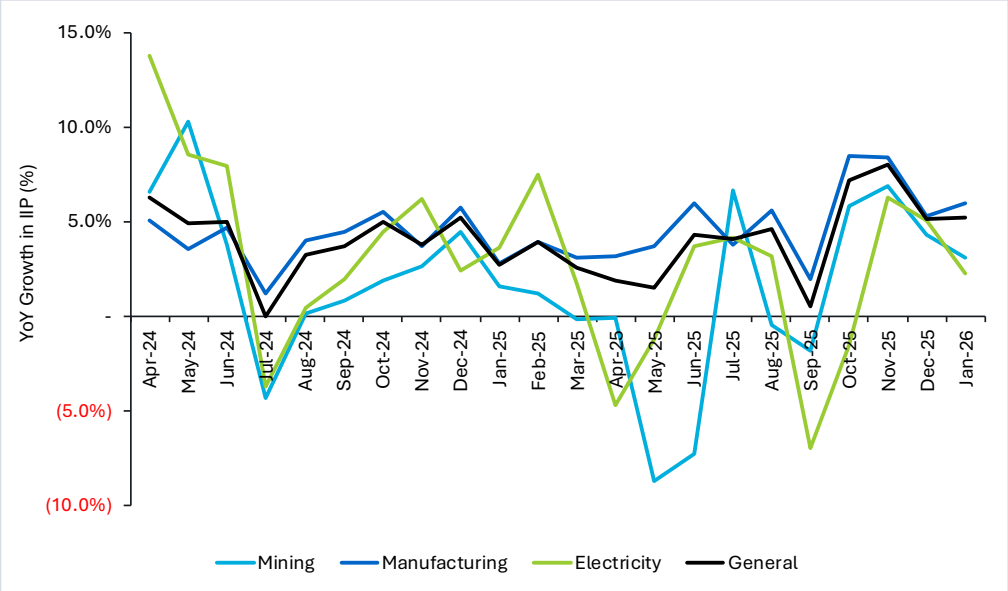
4.7 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 5.8% growth over FY25Q1 levels.

4.8 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth

[16] Gov**ernment of India PIB Release (27th February 2026)**

trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr'25-Feb '26), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

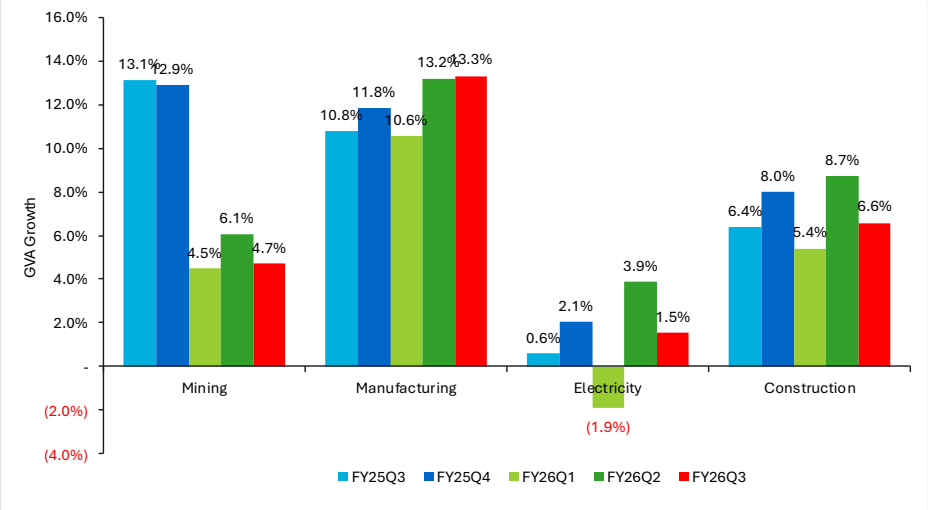
Figure 4.5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.9 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4.6: Industrial components of GVA



Source: Steer Analysis of MOSPI Data

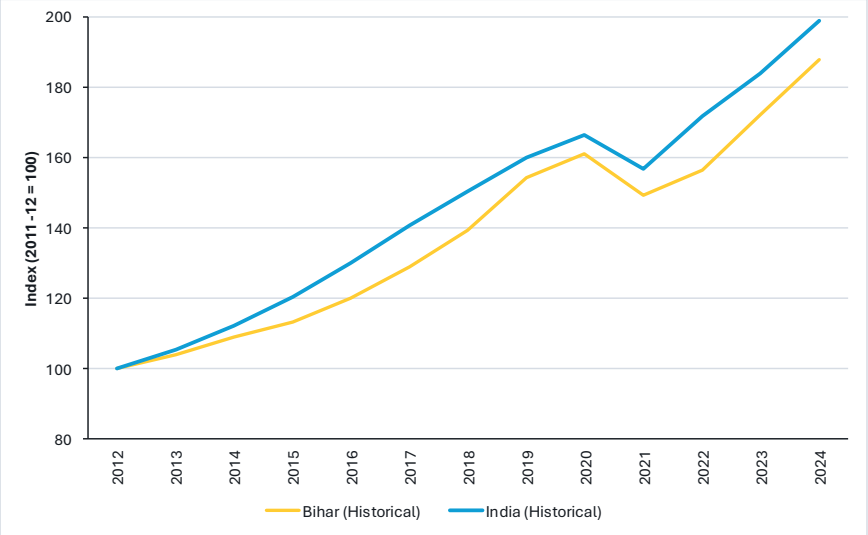
GDP and GSDP Growth

4.10 Over the period FY12-FY24, the Indian economic has grown at a CAGR of approx. 6% aided by growth in the tertiary sector which grew at a CAGR of approx. 6.9% over the same period. The economic performance of Bihar has been weaker than the country during the same period. Bihar's GSDP CAGR was 5.4% between FY12-24. Bihar approximately contributes 2.7% to the India's GDP. Between 2012 and 2024, Bihar's GSDP grew steadily, nearly doubling in real terms. The state saw consistent growth until 2018–19, peaking at approx. 10.9%, before slowing due to the pandemic, with a contraction of 7.4% in FY21. A strong recovery followed, with growth rebounding to over 9% in FY23 and FY24.

4.11 Bihar is largely an agrarian state, with around 77% of population dependent upon agriculture as a livelihood[1]. The state is one of the largest producers of vegetables and fruits in the country, especially, sugarcane, banana, mango, and eggplant.

4.12 Figure 4.7 below illustrates the evolution of Bihar's GSDP during FY12-FY24.

Figure 4.7: Evolution of Bihar's state GDP and National GDP



Source: Ministry of Statistics and Program Implementation (MoSPI)

4.13 The official historical GDP and GSDP data for India are released by the Ministry of Statistics and Program Implementation (MoSPI). The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[17], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP and develop GSDP forecasts as a function of our assumed GDP forecasts[18].

4.14 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth

[17] Consensus Economics - Economic Forecasts and Indicators

[18] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

Forecasts for growth drivers

4.15 Following the discussion in Chapter 4 on the nature of economic activity in the state of Bihar, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth on the Asset.

4.16 We have based our forecasts of Bihar GSDP using forecasts of GDP as provided by the Client.

National GDP

4.17 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[19]

4.18 The Covid19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23, 9.2% in FY24 (as per the SAE) before slowing down to 6.5% in FY25 due to several domestic and external factors.

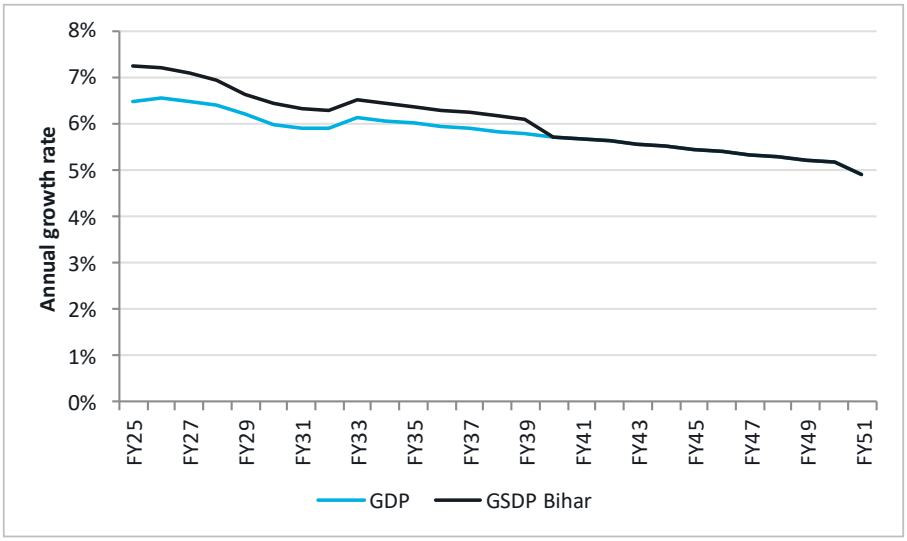
4.19 Figure 4.8 below shows client provided GDP projections for India. The forecast projects the Indian GDP to grow at 6.3% between FY27-FY30 which is gradually tapered down to 5.2% by FY50. The India GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI[20] in the short term.

4.20 We expect Bihar's GSDP to grow faster than India's overall GDP, driven by its low base, rising infrastructure investments, and growth in construction and services sectors. Government focus on rural development and improving connectivity is also expected to boost economic activity in the state.

[19] **Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu** (September 2020)

[20] **Survey of Professional Forecasters on Macroeconomic Indicators – Results of the 93rd Round (April 2025)**

Figure 4.8: GDP-GSDP forecast



Source: GDP forecast provided by the Client

4.21 By comparing historical trends of regional GSDP growth with the national GDP growth we have established GSDP projections for each state. We assumed that as the Indian economy grows, the states which have historically grown at a faster pace will, over 10 years, see a slowdown in GSDP growth, tending to the national average, whereas the states that have grown slower than the national GDP will begin to pick-up. The GDP-GSDP gap would converge by 2040.

5 FY26 base year AADT and Traffic Growth Analysis

Introduction

5.1 In this section, we present our approach, assumptions, and estimates for base year AADT and background traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 While comprehensive historical data on the asset is not available, we have access to six years of records. Despite some inconsistencies, this dataset provides a reasonable foundation for analysis. As a result, statistical methods to estimate background growth relationships could not be applied. Instead, we conducted a benchmarking exercise, supported by trip length and origin-destination (OD) analysis, to derive elasticity estimates. These are discussed in detail below.

FY26 base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3, to establish the base year (FY26) traffic position, we utilized information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

5.6 The base traffic for FY26 has been estimated using 11 months of actual traffic data (April to February). Each toll plaza's seasonality correction factors were applied on the actual MADTs of Apr-25 to Feb-26 to obtain seasonally corrected estimates for FY26 traffic. An average of these estimates was considered to be the FY26 base traffic.

Seasonal Correction Factors

5.7 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is

generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.8 To normalize for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.9 Table 5.1 below presents the average of FY23 and FY24 SCF used to estimate the AADT for the Asset.

Table 5.1: Adopted SCF for the Asset, FY23 and FY24 average

Vehicle Category	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	1.05	0.89	0.93	1.08	1.12	1.19	1.11	0.89	0.91	1.11	0.91	0.94
LCV	0.97	0.93	0.95	1.05	1.09	1.04	1.05	0.97	0.95	1.12	1.12	0.87
Bus	0.98	0.90	0.86	0.93	1.10	1.06	1.09	0.96	1.02	1.21	1.03	0.98

Total	**10,029**	**10,674**	**10,750**	**7.2%**
PCU	**22,109**	**23,234**	**23,349**	**5.6%**

Source: Steer analysis; Note: FY25 actual full year; FY26YTD includes 11 months (Apr-Feb) of FY26; FY26A is adopted base for FY26 which is based on actual data for 11 months (April-February) and 1 month of estimated traffic (March)

5.11 Table 5.2 indicates a total PCU growth of 5.6% in FY26, primarily driven by an increase in CJV traffic and an 8.3% rise in 2A vehicle volumes. The growth in traffic in 2A is linked to increased LPG and petroleum activity in the region, as discussed in Chapter 2 of this report.

5.12 The MAV traffic regained traction in FY26 compared to FY25 which exhibited flat growth largely due to the economic slowdown in Bihar, particularly in the manufacturing and construction sectors. Additionally, recent announcements of road and oil-related infrastructure investments in the state are likely to drive future demand for construction materials and petroleum transport, fostering healthy long-term growth on the asset.

Estimation of background elasticities

Overview

5.13 For brownfield Asset, where sufficient historical traffic evolution is available, it is common practice to use regression model analysis to determine the relationship, expressed as elasticity, between traffic growth and key socioeconomic drivers. This relationship is then applied to assumptions of future socio-economic evolution to estimate future traffic growth.

5.14 As for the Asset under consideration, a historical trend was not available since the Asset started tolling by the client in Oct-2020 and both FY21 and FY22 have been affected by Covid19 related disruptions. Therefore, we undertook a benchmarking exercise in order to estimate our forecast elasticities, Sources used included historical vehicle wise traffic growth on the Asset, outputs from the analysis of the OD data (refer chapter 3 for Commodity and trip length analysis) collected on the toll plaza. We have also undertaken a regional benchmarking against Asset having similar traffic profiles, which gives us reasonable confidence in the relationships proposed.

5.15 In terms of selection of growth drivers for vehicle types, in general we have assumed GSDP as the key driving factor for the CJVs and Buses given this traffic is generally driven by the local economies of the cities and state containing the Asset. The heavier commercial vehicles such as generally travel long-distance, and the underlying growth is governed by the general economies of several states or nation as whole.

5.16 Given the nascent stage of India's logistics sector, characterized by a highly fragmented trucking industry (95% of operators owning fewer than five trucks) and low car ownership rates (30-35 per 1000 people), the forecast elasticities are projected to remain constant throughout the concession period. This assumption is grounded in historical trends and a long-term perspective on regional and national growth, suggesting market maturity is still several years away.

5.17 Table 5.3 below presents the growth drivers identified to model the forecast background traffic growth rates.

Table 5.3: Identified growth drivers to model traffic growth

Vehicle type	GDP India	GSDP Bihar
Car		100%
LCV		100%
Bus		100%

2A	100%	
3A	100%	
MAV	100%	

Source: Steer Analysis

5.18 Further to developing estimates for FY26 AADT, the Asset has operational history between FY22 and FY25, proving us four years of traffic growth on the Asset. Table 5.4 below summarises the volume growth across each of the vehicle categories. For this comparison we have normalised the FY22 AADT for COVID19 by adopting seasonally corrected H2FY22 as the FY22 normalised (FY22N).

Table 5.4: Passenger and Commercial growth with normalised FY22

	FY22N	FY23	FY24	FY25	FY26A	FY22N-26 CAGR
CJV	4,118	3,978	4,229	4,489	4,977	4.9%
LCV	483	491	468	386	394	(4.9%)
Bus	439	397	361	489	534	5.0%
2A	1,042	1,105	1,121	1,190	1,289	5.5%
3A	1,083	1,081	1,072	1,005	986	(2.3%)
MAV	2,349	2,346	2,394	2,468	2,569	2.3%
Total	**9,516**	**9,401**	**9,633**	**10,029**	**10,749**	**3.1%**
PCUs	**21,093**	**21,012**	**21,303**	**22,109**	**23,344**	**2.6%**
Passenger	**4,557**	**4,375**	**4,575**	**4,978**	**5,510**	**4.9%**
Commercial	**4,474**	**4,532**	**4,587**	**4,663**	**4,844**	**2.0%**

Source: Steer Analysis; Note; Passenger includes CJV and Bus traffic whereas Commercial includes 2A/3A/MAV traffic

5.19 The Asset is growing at 2.6% from FY22N to FY26 at the PCU level. Passenger traffic, which includes CJV and buses, is projected based on the state's GSDP, as the growth is driven by the regional local economy.

5.20 Meanwhile, commercial traffic (2A/3A/MAV) is growing in relation to GDP, as the asset lies on the NH52 corridor, which primarily facilitates north-east movement between UP and north India and East India and Bihar. Any growth observed on the asset is influenced by regions along this north-east route. 2A have registered a healthy CAGR of 5.5% whereas MAV traffic has registered a rebound in FY26 after a flatline performance in FY25.

5.21 The sections below detail out the reasoning for selection of respective growth driver(s) for each vehicle category.

5.22 In recent historical traffic performance across national highway corridors, a notable trend has emerged: there is a noticeable shift in axle preference towards 2As and MAVs, resulting in a dampening effect on the growth of 3As. This trend is mirrored in FY26 performance as well. Because of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

Table 5.5: Elasticity recommendations for the Asset (Kotwa- Muzaffarpur)

Vehicle Category	Growth Driver	Elasticity	Comments
CJV	GSDP Bihar	1.0	CJV cater to local movement between Motihari, Muzaffarpur, Kotwa, and Patna. Around 92% of the trips have one end of their trip in Bihar. Strong traffic growth is benchmarked to reference Asset
Mini-LCV	GSDP Bihar	0.6	MLCV on this Asset has witnessed a growth with increasing demand for Local and IAOI

Vehicle Category	Growth Driver	Elasticity	Comments
			movements withing 300km. Therefore, elasticity of 0.6 is assumed.
Buses	GSDP Bihar	0.5	Buses tend to grow as the intercity connections improve. With Bihar being a state, which is growing, buses tend to play an important role linking key cities in the state. However, the volume of bus remains similar in last few years. Over half of the trips are within 100-300 km. Therefore, 0.5 elasticity is assumed.
LCV	GSDP Bihar	0.4	2A in this region and country have started doing long- medium distance movement. 2A growth is closer to that MAV growth as the goods being transported on this corridor are travelling long distance and carrying manufacturing, petrol, LPG, kerosene or agriculture, which are more efficient to move using heavy trucks.
2A	GDP	0.8	
3A	GDP	0.1	3A/MAV: Agri products and petroleum/gas are the prime commodities carried from northern parts of the country to northeast and eastern states and to bordering countries. A significant portion of heavy truck movement dependent upon Muzaffarpur/Motihari industries as well. The Asset also caters to movements in regions outside India, such as Nepal, Bangladesh and Bhutan which represent 10% of 3A/MAV shares. With same toll rates applicable and benefit of carrying additional tonnage in the region and countrywide a shift from 3A to higher category MAV is observed.
MAV	GDP	0.9

6 Forecast: Network overlays and forecasts

Introduction

6.1 Following the discussion on our forecast of background growth rates in the previous chapter, this chapter first covers the potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentation, trip factors and evolution of toll rates for the forecast period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.2 This section details the impacts, which we believe would affect traffic on the Asset during the concession period. As discussed in previous Chapters, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

Proposed Gorakhpur Siliguri Expressway

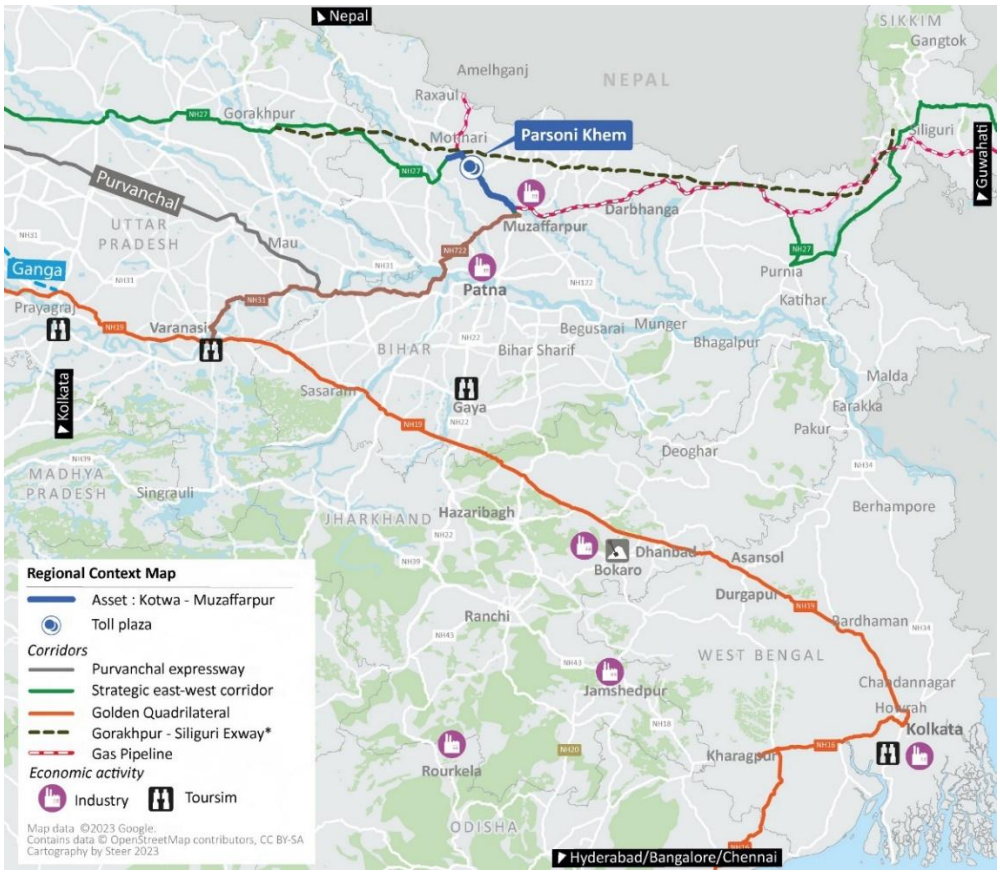
6.3 The central government has approved the Gorakhpur-Siliguri six-lane greenfield expressway project, a 568-km high-speed route. This expressway will traverse through 313 villages across 39 blocks in eight districts of Bihar, covering a total of 417km within the state. The project includes the construction of several bridges over major rivers like Gandak, Bagmati, and Kosi. The estimated cost of the project is ₹38,645 crore, with Bihar contributing ₹27,552 crore[21]. The project is currently in the Detailed Project Report (DPR) and land acquisition stage[22], with no officially announced timeline for completion. Given the early stage of project development, the scale of the proposed 560+ km alignment, and the inherent challenges associated with large-scale greenfield infrastructure—including inter-state coordination, environmental clearances, and land acquisition complexities—Steer has adopted a conservative completion estimate of 2035. This assumption reflects our qualitative understanding of typical timelines for similar expressway projects.

[21] **Centre approves Gorakhpur-Siliguri 6-lane expressway | Patna News - The Times of India**

[22] **Construction of Gorakhpur-Siliguri Expressway will start soon |** गोरखपुर-सिलीगुड़ी एक्सप्रेस-वे का जल्द शुरू होगा निर्माण: **3** जिलों के **115** गांवों की जमीन का होगा अधिग्रहण**, 32** हजार करोड़ आएगी लागत - **Gorakhpur News | Dainik Bhaskar**

6.4 The proposed alignment of the expressway runs parallel to the Asset, and will affect trips moving from UP, Bihar towards West Bengal/Northeast will have an option to travel via Asset or the expressway. This greenfield expressway will lead to attractiveness of the traffic traversing between these three states and North-east as it is going to cut down the travel time significantly, therefore the same have been considered as in scopes.

Figure 6.1: Proposed Alignment of Gorakhpur Siliguri Expressway



Source: Steer cartography using OpenStreetMap data

6.5 Table 6.1 below shows the comparison the key input toll and time comparison between route via Asset and the alternate:

Table 6.1: Toll & Time Comparison between Asset and Alternate

Vehicle category	Toll (INR)	
	Via Asset	*Via Expressway*
CJV	1,025	1,261
LCV	1,635	2,029
2A	3,445	4,266
3A	3,760	4,650
MAV	5,400	6,695

3A	(14.1%)	(17.7%)
MAV	(10.0%)	(12.6%)

Source: Steer analysis, Full impact will be applicable from FY36, while impact will be applicable in a phased manner from FY35.

6 laning LOS improvement

6.6 As per the concession agreement as soon as the Asset hits 40,000 PCU's the Asset is eligible for capacity augmentation. The PCU level need to be maintained above the 40,000 levels for three consecutive years and two years will be earmarked for DPR preparation. After that a three-year period is factored in for construction, during which 75% toll rates will be applicable in all 3 years of construction period. After the construction is over the toll rates will be calculated as normal, as they should have been in that year.

6.7 On the Asset, it is expected based on our forecasts that traffic volumes will go beyond the 40,000 PCUs mark in FY40, thus breaching the capacity requirements set out in the concession agreement, thus leading to capacity augmentation on the Asset. We expect the level of service on the Asset to improve post capacity augmentation. To calculate this impact, we have employed a GJC based approach.

6.8 A comparison of generalised journey costs (GJC) estimates how different elements of cost and time affect traffic. This comparison was done for both light and heavy vehicles. Lower GJCs correspond to higher induced traffic. Based on Steer's studies and research in India, we have found that for every 1% reduction in the GJCs, the traffic increases by a factor of 0.3. We then applied the difference of GJCs to the elasticity of 0.3 to get net influence on the traffic.

6.9 The improvement in travel costs or GJC is translated into the impact on that share of local + IAOI OD movements using a linear inverse relationship. Therefore, the GJC influence is applied on the corresponding shares of traffic, which were extracted from OD data.

6.10 Table 6.3 below shows the extent of the LOS impact.

Table 6.3: Impact of 6 laning LOS improvement

Vehicle category	FY48 onwards
Staging	*100%*
CJV	1.9%
LCV	1.2%
2A	1.1%
3A	0.6%
MAV	0.5%

Revenue forecasting assumptions

6.11 To forecast the revenues for a particular financial year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate, which grows over the years as defined in the Concession Agreement. While "trip factors" provide the conversion factor to the former, i.e., traffic (trips) to tickets sold, "toll segmentation" provides the latter i.e., the breakup of trips paying each ticket type. This section discusses assumptions related to trip factors, toll segmentation and toll rates for the forecast period.

Trip factors

6.12 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in Table 6.4 below:

Table 6.4: Trip factors at TP1 Parsoni Khem

Forecast	CJV/MLCV	LCV	Bus	2A	3A	MAV
Single	1	1	1	1	1	1
Return	2	2	2	2	2	2
Monthly	45	45	50	45	74	45
Local commercial	1	1	1	1	1	1
Local Personal	15	20	20	20	20	20

Source: Steer analysis of Client TMS data

Toll segmentation

6.13 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles[23].

6.14 Across multiple assets, the share of annual pass trips has been rising on a monthly basis since August 5. A corresponding decline in other ticket categories including Single and Return journeys has been observed.

6.15 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and post-annual pass segmentation from 15th August 2025 till 28th February 2026. The share of annual pass trips in March 2026 has been assumed to be the same as the share of annual pass trips in the last 10 days of February 2026.

6.16 The segmentation for CJVs in FY27 has been assumed to be the same as the estimated March 2026 segmentation as trends suggest that the share of annual pass trips have stabilised.For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Feb) as discussed in the earlier sections, can be considered a normal period.

[23] Finalization-Concessionaire-Annual-Pass-Facility-on-NHs-01092025.pdf

Table 6.5: Toll segmentation FY26 onwards, TP1 Parsoni Khem

Ticket type	CJV FY26	CJV FY27	MLCV	Bus	LCV	2A	3A	MAV

6.17 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.6 presents the Annual pass compensation computed for the toll plaza.

Table 6.6: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY28	FY33	FY38	FY43	FY51
Parsoni Khem	1.6	4.0	6.8	11.6	19.2	42.3

Source: Steer Analysis

Toll evolution

6.18 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five decimals to estimate the final toll rate charged to users.

6.19 We have used actual toll rates from the FY25 toll notifications and FY26 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown in the table below. These forecasts provided by the Client expect the Indian WPI to grow at an average of 4.2% between FY25-FY51. The WPI forecasts available from other independent forecasting agencies may vary from this assumption and could be lower or higher than that provided by the client.

Table 6.7: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	0.96%
FY28	5.0%
FY29	5.1%

Financial year	WPI growth (%)
FY30	4.9%
FY31	4.4%
FY32 onwards	4.1%

Source: FY28 onwards WPI as per client inputs

Revenue reconciliation

6.20 As part of validating the data provided by the Client, as well as our assumptions around toll calculations, we have reconciled the actual reported revenue on a monthly level for the Asset. To reconcile we have used the FY26YTD segmentation, FY26YTD AADT and compared it with the reported revenue for the year. The exercise was undertaken at an annual level. The comparison, as shown in the table below, depicts the modelled revenue vs the reported revenue difference, and the difference lies within 1%, this gives us the confidence in the assumptions around segmentation and trip factors for future forecast purposes.

Table 6.8: FY26 Revenue reconciliation summary (INR Lakhs)

Asset	Modelled	Actual	Difference (%)
	FY26YTD	FY26YTD	
TP1-Parsoni Khem	33.62	33.62	(0.02%)

Source: Steer comparison between modelled and reported revenue, FY26

Traffic and Revenue forecasts

6.21 Based on the traffic and revenue-related forecast assumptions discussed above, we have modelled the traffic and revenue forecasts for the concession length of the Asset. The table below presents the AADT/PCU and revenue forecast growth rates and CAGRs on this Asset. Further, Appendix B presents the AADT and revenues for the concession period.

Table 6.9: Traffic forecast (with impacts) for TP1 Parsoni Khem

Vehicle Type	FY26	FY28	FY33	FY38	FY43	FY51

Source: Steer analysis

6.22 As presented in the tables above, traffic CAGRs (PCUs) for the traffic forecast (with impacts) on the Asset over the concession period is around 4.2% and corresponding revenue CAGR is around 8.9%. This growth is majorly driven by:

6.23 CJVs, as discussed in the historical section, this Asset has an even mix of CJVs and MAVs. The CJVs on the Asset are expected to grow with increasing per capita income levels of the region and are expected to grow at a healthy rate for a longer period, given the low car ownership levels in the state.

6.24 While MAV carrying heavy Agri commodities rice, maize and wheat as expect with the increased production in Agri industries as explained in Chapter 2, MAVs will witness a healthy growth on this Asset in long term as well.

Target revenues and modification of concession period

6.25 As per the concession agreement, the target revenue for TP1 should be 14.2 Cr for the month of March 2030 first calculation of target revenue and 23.12Cr for the month of March 2040 for the second calculation of target revenue. The traffic sampling will be undertaken for a continuous period of seven days during anytime within 15 days prior to the date on the specified year, previous year and following year. The average thereof will be deemed as 'actual revenue.'

6.26 If the target revenue falls short or exceeds by 20% and 30% for extensions 1 and 2 respectively, the concession period shall be deemed to be modified using the laid-out conditions in the concession agreement. The table below presents the summary of the analysis.

Table 6.13: Target Revenues for Extension 1

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2029	2030	2031		
KM	Mar-30	14.22	14.62	16.08	17.62	16.11	13.3%

Source: Steer analysis

Table 6.14: Target Revenues for Extension 2

Asset	Target Month	Target Revenue	Estimated Revenue			Average Revenue	Variation (%)
		Cr	2039	2040	2041		
KM	Mar-40	23.12	32.61	35.65	38.94	35.73	54.6%

Source: Steer analysis

6.27 We have used the average AADT forecast for target year, previous year and following year as a proxy for 'actual traffic.' We have applied seasonality of March month to adjust for seasonal trends and arrive at March traffic from AADT traffic, which is then segmented according to the forecast toll segmentation and trip factors and multiplied with respective estimated toll rates to get to a monthly revenue collection.

6.28 As seen from the table above, the target revenue forecast for the Asset is higher than the Concession Agreement target revenue by a rounded 13% for target date 1 and 55% for target date 2. As the difference lies below the permitted threshold 30% for target date 1 and above 30% for target level 2 respectively, a change in the length of the concession is expected. As per the Concession Agreement, for every 1% excess target revenue, the concession period shall be decreased by 1.5%, with a capping at 20%. Therefore, for the excess traffic on these toll plazas, the concession period, originally 30 years, is expected to reduce by five years from FY51, potentially changing the concession period to end by FY46 instead of FY51.

Upside and Downside cases

Upside and Downside scenario assumptions

6.29 We have developed our base case scenario considering a balanced view on the risks associated with input assumptions around GDP growth and traffic growth elasticities. There is always a risk that the outturn values of these inputs will vary as compared to the assumptions taken due to exogenous impacts, e.g. GDP growth could be influenced both positively and negatively by the impact of monsoons, export-import balances, political changes etc.

6.30 Similarly, traffic growth elasticities could be influenced by increased efficiencies achieved by technology, large shifts in commodity prices globally, changes in local manufacturing practices. However, at this stage we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

6.31 To account for the possible variations in the growth drivers, we are also presenting an Upside (optimistic) and a Downside (pessimistic) scenario. These scenarios are defined by the following variations from the base assumptions:

Table 6.15: Summary of Macro-economic Assumptions for upside and downside cases

Input	Upside	Downside
Macro Assumptions		
GDP/GSDP	+1% every year	-1% every year
WPI	+1% every year	-1% every year
Elasticities	+ 10%	- 10%

Source: Steer analysis

6.32 Further, network developments are highly dependent on governmental directions, policies, legal and financial measure which might result in early or delayed completion of developments. Therefore, we have included an Upside (optimistic) and a Downside

(pessimistic) case. However, at this stage, we consider that the base case represents a central case scenario given the risks of variation of input assumptions.

Impacts-Upside Case

6.33 The upside case impacts included in forecasts are summarised in below.

Table 6.16: Summary of impacts on the Assets (upside)

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact
6 laning LOS improvement	FY45	+25% of base case	CJV: 2.4% LCV: 1.5% 2A: 1.4% 3A: 0.7% MAV: 0.6%
Gorakhpur Siliguri Expressway	FY36 (80%) FY37 (100%)		2A: (10.7%) 3A: (13.3%) MAV: (9.4%)

Source: Steer analysis of OD data

Impacts-Downside Case

6.34 The downside case impacts included in forecasts are summarised in below.

Table 6.17: Summary of impacts on the Assets (downside)

Development	Year of impact	Change in impact w.r.t base case	Magnitude of impact
6 laning LOS improvement	-	-25% of base case	*No Impact*
Gorakhpur Siliguri Expressway	FY33 (80%) FY34 (100%)		2A: (17.9%) 3A: (22.1%) MAV: (15.7%)

Source: Steer analysis of OD data

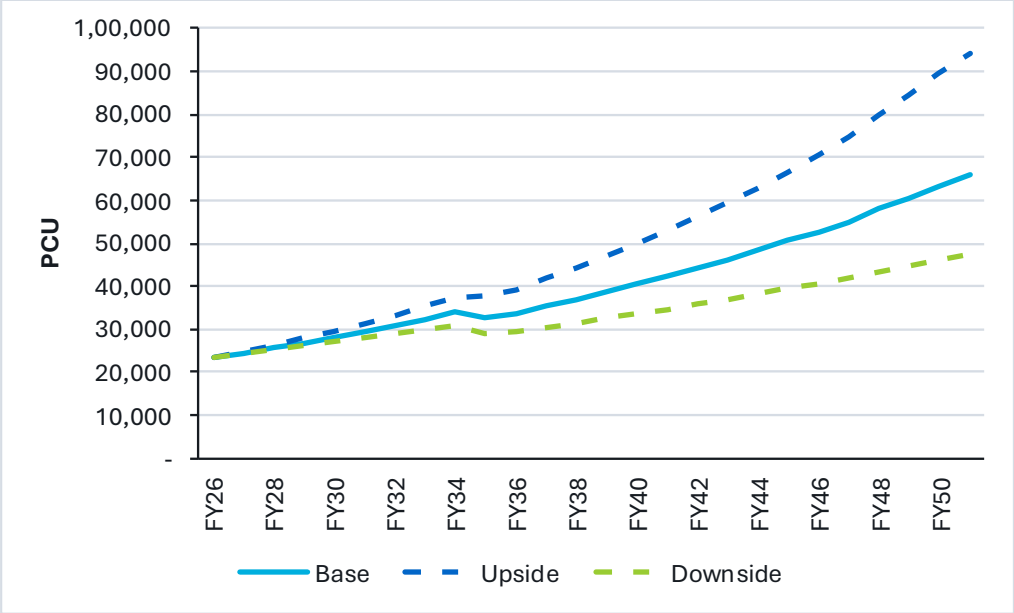
6.35 Based on the above assumptions for upside and downside scenarios, the following table summarizes the upside potential and downside risks associated with the PCU and the revenue for Parsoni Khem toll plaza at the end of the concession i.e. FY51.

Table 6.18: Upside potential and Downside PCU scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Parsoni Khem	43.4%	(28.0%)

Source: Steer Analysis

Figure 6.2: Long-term PCU forecasts for Parsoni Khem TP including upside and downside scenarios



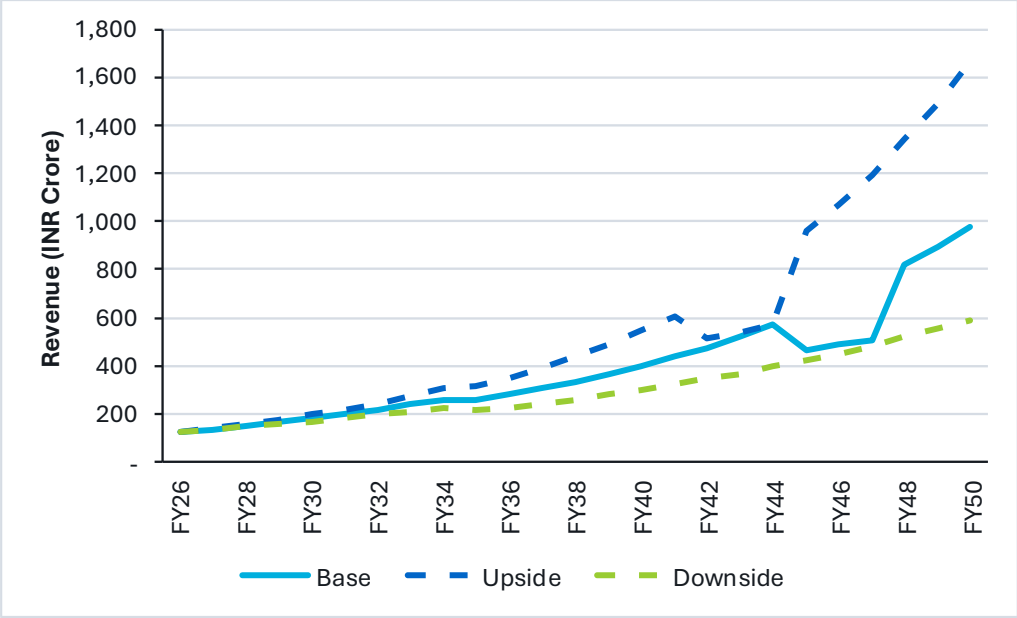
Source: Steer Analysis

Table 6.19: Upside potential and Downside Revenue scenario – FY51

Toll Plaza	Upside Potential	Downside Risk
Parsoni Khem	75.3%	(55.4%)

Source: Steer Analysis

Figure 6.3: Long-term revenue forecasts for Parsoni Khem TP including upside and downside scenarios



Source: Steer Analysis

6.36 Revenue projections exhibit variability in both the upside and downside cases, driven by fluctuations in macro-economic factors such as WPI, GDP/GSDP, elasticities and the network impacts.

Summary Outlook

6.37 Passenger movement on the Asset is largely local in nature, connecting the cities of Motihari, Patna, Muzaffarpur to West and East Champaran, Chakia and other nearby towns. Cars are expected to see a healthy growth on the Asset following the overall behavioural shift of users away from public transport.

6.38 The Asset benefits from its strategic location, facilitating the east-west movement of goods from Uttar Pradesh and the Delhi NCR region towards Bihar, West Bengal, and the northeastern states. Additionally, the proximity of the Nepal border near Raxaul serves as a key destination for a substantial share of traffic using the Asset. The 3A/MAV traffic on the Asset predominantly caters to long-haul routes, with approximately 70% of users covering distances exceeding 500 km.

6.39 This segment of traffic is expected to exhibit a relatively muted growth trend in the near term, particularly given the prevailing economic slowdown in Bihar projected to continue until FY27. Beyond FY27, it is anticipated that the regional economic conditions will improve, leading to a gradual normalization of economic activity and corresponding traffic growth on the Asset.

6.40 Our findings and estimates in this report are based on our understanding from the site visit, analysis of primary data available both from surveys and the toll management system (both historical and current), macroeconomic assumptions prescribed by Client, feedback from Client meetings and secondary publicly available data. There can be both positive and negative risks associated with assumptions and the forecasts using them as summarised below.

6.41 Overall, we see a positive outlook for the region and the Asset in the longer term, given that it serves major urban centres of Delhi NCR, Lucknow, Patna all the way to East and North-East India along with bordering countries for major commodities. The underlying growth drivers of the corridor are strong and are expected to deliver long term sustained growth.

Appendices

A Top 10 OD Pairs

A.1 Further to the OD analysis presented in Chapter 3 this appendix presents the top 10 OD pairs at each toll plaza. Please see this data for both CJVs and MAVs and OSVs combined below.

TP1 Parsoni Khem

Table A.1: CJV, Bus and Mini Bus top 10 OD pair shares at TP1 Parsoni Khem

	OD Pair	Share
1.	Patna-Motihari	19.3%
2.	Muzaffarpur-Motihari	19.2%
3.	Muzaffarpur-Bettiah	7.4%
4.	Patna-Bettiah	6.5%
5.	Patna-Raxaul	2.9%
6.	Muzaffarpur-Pipra Kothi	2.7%
7.	Muzaffarpur-Raxaul	2.2%
8.	Motipur-Motihari	1.9%
9.	Muzaffarpur-Uttar Pradesh	1.6%
10.	Vaishali-Motihari	1.4%

C Data Collection Exercise

C.1 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Asset. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

3 days TVC count

Table C.1: 3-day TVC counts at TP1 Parsoni Khem

Date	Source	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total

Disclaimer

This report has been produced for the sole benefit of Cube Highways Pte. Ltd. This Report (the "Report") is confidential and disclosed only for information purposes, and it may not be relied upon by any party other than the Client or a Party to a Reliance Letter, and Steer: a) makes no warranty, expressed or implied, with respect to the use of any information or methods disclosed in this Report; and b) assumes no liability with respect to the use of any information or methods disclosed in this document. Any such party by its acceptance or use of this Report releases Steer from any liability for direct, indirect, consequential, or special loss or damage whether arising in contract, warranty, express or implied, tort or otherwise.

The Report is based on standard professional efforts, and information available to us at the time the review took place and is subject to time and budget constraints of the Report's scope of work. This Report, information and statements contained herein, are all based on third party data provided to us, or sourced by us, and Steer has not sought to establish the reliability of the data, except as specifically stated in the Report. Steer bears no responsibility for the results of any actions taken on the basis of third-party data.

Certain forward-looking statements in the Report are estimates based on interpretations or assessments of information available at the time of writing. The Report is thus to be viewed as an assessment that is time-relevant, specifically referring to conditions at the time of the review. Steer undertakes no obligation to update the Report for any reason.

While the estimates contained in the Report are not precise forecasts, they do represent, in our view a reasonable expectation of the future, based on information we have been provided with or sourced. However, the estimates necessarily rely on numerous assumptions and judgements, and circumstances may occur over the timeframe of the project that go counter to these assumptions and judgements and that affect the project's realized revenues. Actual events may differ from those assumed, and events are subject to change. Therefore, Steer makes or provides no warranty, whether implied or otherwise, as to the accuracy of forward-looking information presented. Further, it is important to note that forecasts presented represent long term growth profiles; the results for individual time periods may vary from forecasted values.

Traffic Consultant developed the relationships in the models used to produce the forecasts for the projects based on data available through February 2026. This report does not consider variations in traffic performance due to changing macro and force majeure events such (but not limited to) as global wars, economic uncertainty (high inflation, global recession), and changes in the regulatory environment. The situation remains dynamic and is subject to significant change in the short and medium term. In this challenging context, Traffic Consultant has produced base forecasts with a view on a possible scenario for the traffic forecasts. However, it is important to note that this is only one view, and there continues to remain uncertainty as to the short-term, intermediate or prolonged effects of and responses to such macro-economic/force majeure events. As a result, no assurance can be provided by Traffic Consultant that the scenarios and assumptions Traffic Consultant has identified will prove to be accurate. Given the uncertainty inherent in this scenario, Traffic Consultant advises that all readers of the Report consider the Report in the context of their own assessment of the impact of such events.

TO THE FULLEST EXTENT PERMITTED BY APPLICABLE LAW, THE LIABILITY OF THE TRAFFIC CONSULTANT FOR ANY LOSS, DAMAGE, COST OR EXPENSE SUFFERED OR INCURRED BY ALL PERSONS OR ENTITIES AND FOR ALL CLAIMS RESPECTING ITS WORK PERFORMED IN CONNECTION WITH THE ISSUE OR THE REPORTS IS HEREBY LIMITED IN THE AGGREGATE TO THE AMOUNT OF FEES ACTUALLY PAID BY THE CLIENT TO THE TRAFFIC CONSULTANT IN RESPECT OF THE REPORTS AND CONNECTED SERVICES.

YTD	Year to Date

1 Introduction

The assignment

1.1 The Cube Highways Fund Advisors Private Limited (the "Client") has commissioned Steer Davies Gleave India Private Limited ("Steer") for a traffic due diligence to be carried out on the Walayar-Vadakkencherry Expressway Private Limited (hereafter called the "Asset"). This report forms part of the annual fair market valuation (FMV) undertaken as part of the "Transit 11 project". This report presents an update of the traffic and revenue forecasts based on primary surveys undertaken in 2026, and actual traffic data available up to February 2026 and latest macro-economic assumptions.

1.2 The Asset consists of a 53.5 km single toll road section of the NH544 between Walayar and Vadakkencherry in Kerala, with a single toll plaza (hereafter, referred to as "TP1" or "Pampampallam") located west of Palakkad and east of the Kerala-TN state border.

1.3 Our scope of work for the traffic and revenue forecasting process includes:

Table 1.1: Scope of work and sources of data

Scope of work	Data source
Review of historical Traffic Management System (TMS) data, Vendor reports and documents	Provided by client for the period between Oct'20 and Mar '26, with FY26 base AADT and forecasts considering data up to Feb'26.
Historical analysis and forecasts for baseline growth, including; — Background growth, and — Seasonality trends	Historical data provided by the Client and benchmarking using plazas in the vicinity or of similar nature of the Asset has been done wherever sufficient data was unavailable.
Validation of revenue reported in FY25YTD	TMS data provided by Client Revenue reconciliation using toll plaza traffic and ticket type data to calculate revenue and reconciling it with toll plaza reported revenue
Origin Destination (OD) analysis to understand growth drivers: — Zonal influence and Top OD pairs — Commodity distribution — Trip length distribution	Origin Destination (OD) surveys undertaken by Steer in 2026 and additionally in previous studies the survey was conducted in 2024
Analysis of upcoming network improvements and other developments, that may have future impacts on traffic	Secondary research and our in-house experience of working in the vicinity of the Asset. Impact analysis to be conducted by Steer based on Generalised Journey Cost spreadsheet-based analysis
Historical revenue analysis and forecasts for revenue estimation, including — Toll segmentation and trip factors,	Calculated from historical data provided by Client

Scope of work	Data source
— Overloading shares	
Final traffic growth forecasts including baseline growth rates and potential future impacts	Elasticity based base growth and potential impacts from secondary research, Asset historical traffic performance and Steer's in-house experience of working on toll roads on the corridor Gross Domestic Product (GDP) forecast assumptions provided by Client
Toll revenue estimation for the entire concession, including toll evolution	Toll evolution based on latest toll notification published by National Highway Authority of India (NHAI) and latest actual Wholesale Price Index (WPI) trends as shared by the Client. Assumptions of WPI forecasts and future tolling length changes provided by Client Revenues estimated as a product of traffic forecasts and toll evolution

Our approach

1.4 Our approach follows well-established practices for forecasting ongoing traffic growth on an existing/brownfield Asset. The analysis is focused on two sets of issues, namely:

Understanding the traffic that is currently using the Asset; and
Identifying how and why that traffic is likely to change in the future.

1.5 To understand the current traffic on the Asset, we have analysed traffic data from multiple independent sources:

- Client-provided secondary data, including:
- TMS data starting October 2020 to February 2026. The historical traffic and revenue presented in Chapter 3 considers information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.
- Concession agreement and toll notifications for FY25 and FY26
- Previous studies related to traffic and revenue
- Steer-commissioned OD survey on 10th February 2026 at Pampampallam toll plaza to validate any change in growth drivers and travel patterns. Additionally, a survey was conducted on 6th February 2024 at the toll plaza for the earlier studies.
- Steer-commissioned TVC survey from 10th -12th March 2026 at Pampampallam plaza.
- We undertook revenue reconciliation for FY26YTD (April 2025 to February 2026) by building up revenue from the traffic reported by the toll plaza and subsequently matching it to the reported revenue for FY26YTD using the prevailing toll rates and reported segmentation/toll-frequencies for FY26YTD. This is a key part of our analysis to validate our future segmentation/toll-frequency assumptions and the Annual Average Daily Traffic (AADT) reported for the toll plaza.

1.6 The estimation of future traffic demand on the Asset was undertaken through:

- Estimating FY26 base year position. The FY25 AADT was calculated using the monthly traffic data for FY25. The annual FY25 AADT was then grown with elasticity linked GDP/GSDP growth to arrive at the FY26 expected traffic. To determine the adopted FY26, the expected FY26 traffic was validated against 11 months of actual traffic (April-February 2026) and necessary adjustments were made where required.
- Secondary research to understand plans for new developments and progress of ongoing developments on the Asset.
- Steer independent primary surveys and site visits to validate our network and contextual understanding.
- Developing a bespoke growth model to forecast year-on-year traffic growth from FY26 to the end of concession period.
- Investigating the elasticity of historical traffic growth compared to state (GSDP) and national (GDP) growth. Where historical data is limited, we have benchmarked the Asset against our Steer knowledge base (e.g., similar Asset types in the same state or on the same corridor), to derive appropriate elasticities.
- Applying our elasticities to independent GDP forecasts as provided by Client.
- Identifying and analysing the potential impacts of any relevant changes to the competitive position of each Asset – these include impacts of changes to road network including expressways and opening of competitive modes of travel.
- Identifying and analysing any other potential impacts to traffic and revenue on each Asset – these include axle load norms, axle shift for heavy goods, FASTag implementation.
- Considering changes in trends of segmentation over time and making suggestions for changes in exemptions in the future.
- Preparing traffic and revenue forecasts for the Asset for the complete length of concession. The analysis here includes the specific impacts of network or other exogenous factors specific to the Asset. We have developed a set of forecasting assumptions for three scenarios: a base case and upside and downside scenarios.

Contents of this report

1.7 The report has been divided into the following chapters:

1. Chapter 1 introduces the methodology and approach to undertake the traffic and revenue due diligence;
2. Chapter 2 describes the key characteristics of the Asset and its surrounding road network, primarily based on site visits;
3. Chapter 3 summarises the current and historical traffic trends on the Asset, including results from the TMS, TVC and OD analysis;
4. Chapter 4 presents the socio-economic context of India, the corridor and region/state containing the Asset, along with our approach and results on estimating background along with our key forecasting assumptions,
5. Chapter 5 presents our baseline year forecast and summarises our results on estimating background traffic demand growth
6. Chapter 6 summarises our assessment of network impacts and presents concession traffic and revenue forecasts for the Asset along with the assumptions for upside and downside cases.

2 The Asset

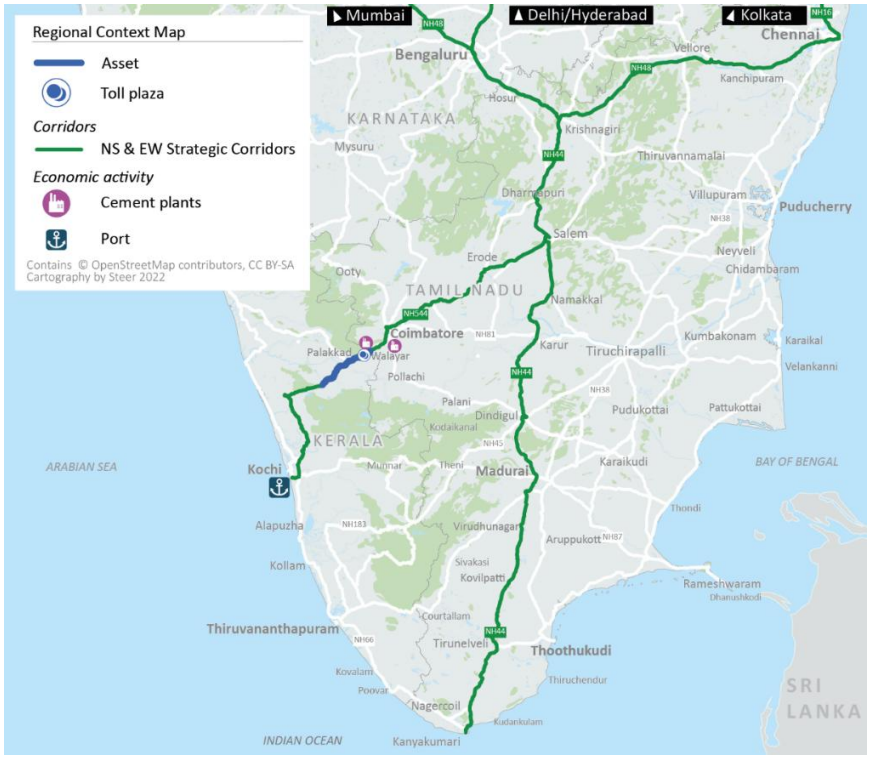
Introduction

2.1 This chapter provides a description of the Asset, based on both primary data (from site visits), and our understanding of the region and network surrounding the Asset. We cover the Asset's strategic network context, followed by key economic activities and network developments around the Asset.

Strategic network

2.2 The Asset is situated in the state of Kerala, connecting Walayar, a town located on the Tamil Nadu-Kerala border and Vadakkancherry, a town in the Palakkad district of Kerala. The Asset is a section of the strategic NH544 which itself is a spur of the NH44 running that runs north-south across the country (Srinagar-Kanyakumari). The section where the Asset is located serves as a key entry point for Kerala from its eastern end, through Palakkad, which is a stretch of low-lying passes between the mountain ranges of the Nilgiris and the Western Ghats. Figure 2-1 below shows the regional road network in which the Asset is located.

Figure 2-1: Asset location in the regional network context



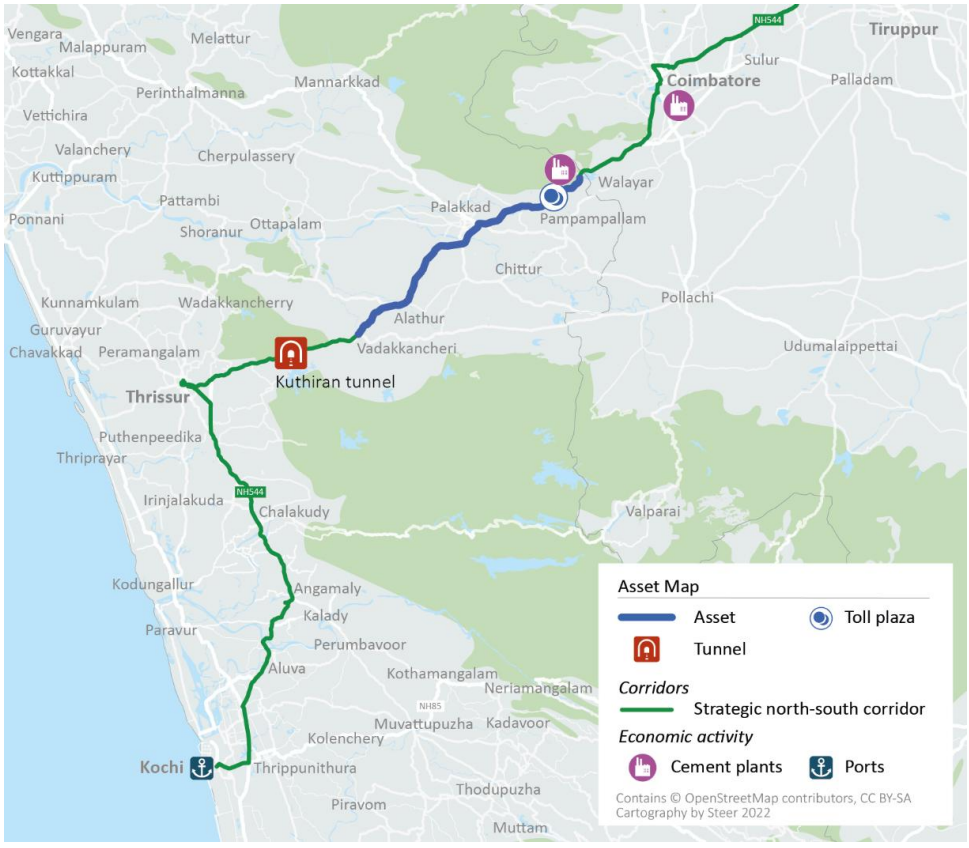
Source: Steer cartography using OpenStreetMap data

2.3 This Asset primarily caters to three different types of strategic movements:

- **Short-distance trips** undertaken largely by passenger vehicles for work/business trips wherein the movement is predominantly local in nature, between Walayar and other areas in the Palakkad district.
- **Medium-distance trips** made by both passenger and goods vehicles covering places such as Ernakulam/Kochi in Kerala, to Erode and Salem in Tamil Nadu.
- **Long-distance trips** predominantly by MAVs catering to Kerala's demand for consumption goods and cement, from areas lying outside the state such as Chennai, Bangalore, Vijayawada, and the rest of the country.

2.4 The Asset is a 53.5 km toll road which forms a part of the NH544, a key highway connecting Salem in Tamil Nadu to Kochi in Kerala. It is a four-lane road with one toll plaza, namely, Pampampallam Hamlet (Pampampallam) at km 189.4 (closer to Walayar). Figure 2-2 below provides a closer view of the Asset in the context of its immediate surroundings.

Figure 2-2: Asset context



Source: Steer cartography using OpenStreetMap data

Concession and tolling details

2.5 The toll plaza on the Asset has been operational since May 2015, and the Client took over its operations on 29th September 2020. There are 12 years remaining in the concession period which ends in FY38. Table 2.1 below presents a summary of the concession.

Table 2.1: Summary of concession

	Particulars
State	Kerala
Highway and lane configuration	NH544; 4-laned
Toll plazas	TP1: Pampampallam
Length (km) as per concession agreement, applicable	TP1: 53.5 km
Commencement of operations	May 2015
Operated by Client since	29th September 2020
Concession period	22 years
Last year of concession	FY38

Source: Client data

2.6 Figure 2-3 below shows a typical cross-section of the Asset and its toll plazas.

Figure 2-3: Typical cross-sections and toll plazas on the Asset

Source: Steer site visit

2.7 Tolls on the Asset are collected as shown in Table 2.2 below. The toll plazas have dedicated ETC/FASTag lanes for electronic tolling. Toll rates applicable for FY26 are provided in the following table.

Table 2.2: Single toll rates on the Asset (INR), applicable April 2025 to March 2026

Type of Vehicle	Single Journey Fee
CJV	80
LCV	130
Bus/2A	275
3A/MAV	430
OSV	525

Source: NHAI Revision of User fee Rate w.e.f 01.04.2025

2.8 Apart from single tickets, the typical NHAI ticket categories like return, monthly, local personal and local commercial passes are also available on the Asset.

Key economic activities

Tourism

2.9 Kerala, one of the two south Indian states forming the southern tip of the Indian peninsula (the other state being Tamil Nadu), and commonly called as "God's Own Country", is known for its largely consumption-based and tourism-centred economy. It is known as the 'Land of Spices' and is a leading producer of pepper, cardamom, and rubber. Other items such as coffee, rice, coconut, tea, cashew, and spices also make up for a share in the state's agricultural output which is distributed to various parts of the country.

2.10 Its rich culture and natural landscape have put the state on the world map as a major tourist destination wherein this sector contributes to 10% to the state GSDP[1]. The city of Thrissur which lies along the strategic north-south corridor (see Figure 2-2: Asset context) is a key tourist destination in the state and is a seat of culture hosting significant festivals.[2]

2.11 Kerala's image as a prime tourist destination is evident by the fact that it attracted 22.3 million tourists in CY 2024, marking a substantial increase of 21% from the pre-pandemic period[3]. The state government has announced the K-Homes project in the 2025-26 budget to increase accommodation for tourists – this is expected to take the state's tourism sector to new heights.[4]

2.12 Given Kerala has very limited entry points from the rest of the country, the Asset forms an integral part of the NH544 east-west corridor and is the only four laned national highway that provides connectivity and a point of entry into the state from Tamil Nadu. Some of the major settlements along the Asset include Walayar, Kanjikode, Palakkad, Alathur and

[1] ECONOMIC REVIEW 2017 | State Planning Board, Thiruvananthapuram, Kerala, India

[2] Major festivals include Attukal Pongala (February), Eid al-Fitr (March), Eid al-Adha (June) and Onam (August-September)

[3] As per the Ministry for Tourism and Public Works, Government of Kerala

[4] Kerala attracts over 2.22 crore tourists in 2024 - tourismindiaonline.com

Vadakkancherry whereas long-distance traffic on the road serves cities in other states such as Coimbatore, Salem, Bangalore, and Chennai.

Cement and Construction

2.13 The construction industry contributes a significant share of Kerala's overall state GSVA, at approximately 14% of the state GSDP as of FY24.The industry has also grown consistently over the last ten years, at roughly 3.5% per year between FY14 and FY24 [5]. This consistent growth has been driven by the continued push towards construction projects in Kerela, such as - the widening of NH66[6], other infrastructure such as construction of the Lulu Mall in Kottayam [7]and the construction of Government Medical College, Idukki [8].

2.14 The Kerela Infrastructure Investment Fund Board (KIIFB) has been established by the Government of Kerala to mobilize funds for infrastructure development. Major projects that have been taken up by the KIIFB include a Petrochemical and Pharma Park in Kochi & a Coastal and Hill Highway, connecting different cities within Kerala [9]

2.15 The state of Kerala is also rich with mineral deposits; there were around 643 active quarries and 1,433 active mineral depots within the state as of September 2023[10]. A majority of these units deal with the extraction and processing of granite deposits to cater to construction demand. A considerable number of crushers are present south of the Asset. In additional to stone quarries within the state, construction material is also sourced from the state of Tamil Nadu via Coimbatore. Currently, most of the construction material in Kerala is sourced from mines in Tamil Nadu, particularly in Coimbatore.

2.16 Walayar, part of the Palakkad district in Kerala and situated on one end of the Asset is a small industrial town at the state border between Kerala and Coimbatore, Tamil Nadu. It is home to the state-owned Malabar Cements Limited (MCL) which is the one of the state's largest public sector undertakings (PSU) in cement production, with a production capacity of 6.6 lakh MT per annum.[11]

2.17 The cement produced by MCL caters to 6-8% of the requirement for the whole of Kerala. Future plans include raising the market share to 25% and augmenting the capacity from 0.66 to 0.8 MMTA (million metric tonne per annum) along with an addition of 1 MTA grinding facility and modernisation of the mill at the Walayar plant.[11]

2.18 Kanjikode, situated in the middle of the Asset, is one of the largest industrial areas in Kerala. It is home to the manufacturing base for companies such as Bharat Earth Movers, Pepsico, PPS Steel Pvt. Ltd, Marico, United Breweries and Empee Distilleries.

[9] **KERALA INFRASTRUCTURE INVESTMENT FUND BOARD**

[10] **DMG Dashboard (kerala.gov.in)**

[11] **Malabar Cements**

2.19 While construction of Lulu Mall in Kottayam has been completed in December 2024, the widening of NH66 and construction of GMC, Idukki has been largely completed, thereby causing a drop in construction traffic on the Asset.

2.20 Due to a combination of demand and supply-side disruptions, the movement of construction material from Tamil Nadu into Kerala has significantly reduced. This decline is largely attributed to regulatory and logistical challenges, including the imposition of a mineral-bearing land tax of ₹90/tonne on crushed stone by Tamil Nadu's mining department in April 2025, which triggered strikes by quarry and lorry associations in Coimbatore. Although the strikes were short-lived, the tax remains in force, discouraging outbound quarry traffic. On the Kerala side, material shortages have been exacerbated by border permit issues, as noted in March 2025 reports. In response, Kerala has granted preliminary consent for 885 new quarries—a 160% increase—indicating a strategic push towards self-sufficiency.

Refinery

2.21 Kochi Refinery operated by the Bharat Petroleum Corporation Limited (BPCL), the country's second-biggest fuel retailer, lies within the region of influence of the Asset and produces all fuel-based refinery products - benzene, sulphur, white spirit for the domestic market, and fuel oil for exports.

2.22 BPCL plans to expand the capacity of the Kochi refinery from 15.5 million tons per year (tpy) to 18 million tpy by 2028, as a part of wider expansion plans.[12] This expansion includes upgrading to produce higher-value products and integrating petrochemical facilities, including producing more niche petrochemicals[13]

Ports

2.23 Kerala has a coastline of approximately 590km. The state also has 20 ports (2 major and 18 minor ports), with Kochi port being the largest freight handling port.[14]

2.24 The Asset is located ~110 km from the Kochi port and caters to port-bound traffic. The key commodities handled at the port include petroleum products, crude oil, chemicals, foodgrains, and containers. As per FY24 figures, Kochi which is the largest commercial port in Kerela handled around 36 million metric tonnes of cargo. The port handled all major categories of cargo including liquid bulk, dry bulk, break and containers.

2.25 The historical cargo handling performance of the port till FY25 is presented in Table 2.3 below. The traffic handled at the port has grown at a healthy 6.1% CAGR between FY16 – FY25.

Table 2.3: Category-wise cargo handled at Kochi Port (in '000 Tonnes)

	FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	CAGR (FY16-FY25)

3 Traffic description

Introduction

3.1 This chapter presents historical and current traffic and revenue trends on the Asset, as well as our analysis of origin-destination (OD) survey data and traffic count data. This covers data which was collected as a part of this study and in previous studies, as well as data provided by the Client.

3.2 Traffic demand data is generally collected and analysed to understand the volume and vehicle composition of traffic currently using an Asset, while OD data is used to obtain a better understanding of travel patterns, trip lengths, trip purposes, and areas of influence in the vicinity of the Asset, as well as the commodities being moved by the goods vehicles via the Asset. This analysis, combined with our understanding of the Asset (based on our site visits), enables us to identify the key drivers of demand on the Asset.

3.3 Actual toll plaza data is used as the basis from which the current/base year annual average daily traffic (AADT) is established. This data is provided by the Client and independently analysed and validated by us using traffic volume count (TVC) information.

3.4 The below sections present historical traffic and revenue information up to March 2026. This is to present the latest available traffic and revenue information at the time of submission of report. However, the FY26 base traffic and forecasts presented Chapter 5 onwards use data available up to February 2026, with March 2026 estimated.

PCU Factor assumption

3.5 The PCU values considered in Table 3.1 below are as per IRC64 1990[15]. Based on discussions with the Client, for reporting purposes, we have referred to the Rigid and Trailer truck splits in the TVC counts for calculating the effective PCU for MAV trucks. For Rigid trailer trucks we have assumed a PCU factor of 3, whereas for Trailer trucks we have assumed a PCU factor of 4.5 as defined in IRC64 1990[16]

Table 3.1: PCU factors

Vehicle Category	PCU Factor
CJV	1.0
LCV	1.5
Bus/2A/3A	3.0

[15] IRC 064: Guidelines for Capacity of Roads in Rural Areas

[16] On this Asset, we have 3A/MAV combined volumes. However, for PCU calculations, to maintain consistency, we have used the shares derived from the latest TVC on the Asset (conducted in Jun 2023)

Vehicle Category	PCU Factor
MAV	3.4
OSV	4.5

Source: Steer analysis and IRC64,1990

Historical trends

3.6 Table 3.2 and Table 3.3 below present historical total traffic, and historical tollable traffic volumes (by each vehicle category) observed at TP Pampampallam between FY18 and FY26 (respectively). FY26 volumes were calculated using actual traffic data available for the period April 2025 through March 2026.

Table 3.2: Historical evolution in AADT by vehicle class at TP Pampampallam

	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26	FY18 - FY26 (CAGR %)

Source: Steer analysis of the Client data; FY26 AADT represents the full year actual (April to March); Tollable traffic excludes exemptions and violations

3.7 Historically, CJVs have accounted for the highest share of total traffic observed on the Asset; as of FY26, they accounted for 67% of total traffic on the Asset. This is consistent with expectations, given the Asset's proximity to the major urban centres of Walayar and Palakkad, where there exists high demand for passenger transportation to school or work, and for tourism-related, and medical services. Overall, CJV traffic has observed a CAGR of 7.6% between FY18 and FY26, relative to Kerala's GSDP growth of 4.1% per year over the same period. This trend has continued in FY26 as well, with a 10% increase in FY26 over FY25.

3.8 Trucks on the Asset largely cater to construction demand within the state of Kerala as well as consumption demand arising from local and regional activity centres within the state. Key commodities on the Asset comprise stone and cement which are carried by heavy goods vehicles (3A/MAV). The stone movement happens round the year, with lower movement observed in June and July due to heavy rains. Between FY18 and FY26, MAV traffic grew at an average 5.5% per year, while construction GVA in the state grew at 4.2% per year over the same period.

3.9 As of FY26, 3A and MAV volumes on the Asset observed a decline of 1.4% over FY25 levels. A 10.7% decline in MAV was observed during FY25 over FY24 levels. This is mainly due to reduced movement of construction material into Kerala from Tamil Nadu post border-cess introduction in Tamil Nadu in October 2022[17] as well as a crackdown on illegal stone and sand mining in Tamil Nadu in recent years[18], effectively reducing the supply of construction materials available to transport to Kerala. In April 2025, the mining department of Tamil Nadu had also introduced a mineral-bearing land tax of INR 90/tonne on crushed stone[19]. This corresponded with the mining and geology department of Kerala granting permission for 885 quarries in Kerala[20].

3.10 As a result, the demand for aggregate and construction material from Tamil Nadu's quarries has reduced along with an increase in supply of the same from Kerala. This is expected to impact stone-carrying traffic on the Asset. Given the historical demand of construction material in Kerala; it is expected that the ongoing issue of reduced supply from Tamil Nadu is expected to improve over the next 12-18 months.

3.11 Bus traffic at Pampampallam toll plaza has grown at a 1.8% CAGR, between FY18 and FY26. Buses have experienced a rebound post the pandemic-impacted years of FY21 and FY22, due to the region's resurgence in tourism post-pandemic. As per data from Kerala's Department of Tourism, approximately 70% of the tourists frequenting popular destinations were from the state itself, as of CY 2024.[21] with additional influence from people in the nearby states of Tamil Nadu, Karnataka, Andhra Pradesh and Telangana.

3.12 Bus traffic plying on the Asset grew by 16% in FY23 and a further 11% in FY24, highlighting the post-COVID recovery. Between FY18 and FY26, buses have grown at a CAGR of 1.8%, with recovery continuing at a steady pace.

[20] **Mining and Geology dept grants permission for 885 quarries in Kerala**

[21] **Keralites account for 69% of domestic tourist footfall in State - The Hindu**

3.13 Tollable traffic on the Asset has shown marginally faster growth than observed for total traffic. The observed CAGR of tollable PCU for FY18-26 is 7.6 % which is higher than the growth observed for PCU at total (tollable + non-tollable) level of 6.3%.

3.14 Table 3.4 below present total revenue (in INR Lakhs) by each vehicle category at TP1 Pampampallam plaza over the period FY21 through FY26. It can be noticed that the AADC has grown year on year with the FY26 AADC being 7% higher than that in FY25. FY25 revenue growth remained flat, largely due to a 10.7% decline in MAV during the year.

Table 3.4: Total revenue (INR Cr) and AADC (in INR Lakhs) at TP1 Pampampallam

Year	Total revenue (INR Cr)	*AADC (INR lakhs)	AADC Growth (%)
FY21	41.2	11.3	
FY22	65.6	18.0	**59.3%**
FY23	96.6	26.5	**47.1%**
FY24	106.8	29.2	**10.4%**
FY25	109.3	29.9	**2.4%**
FY26	115.3	31.6	**5.6%**

Source: Client data *AADC represents Average Annual Daily Collection FY26 AADT represents the full year actual (April to March);

Toll Frequencies

3.15 Toll frequency or segmentation is typically the share of each ticket category recorded for a particular vehicle type. This is based on the toll policy that is part of the Asset concession agreement. As a part of our historical data analysis, we calculate the toll frequency for each vehicle category from the monthly data shared by the Client. The most common ticket categories observed on a typical National Highway concession are: Single, Return, Monthly, Local and Exempt. Given the local nature of traffic, some toll plazas offer custom made local passes to attract the local commuters to opt for these category passes instead of evading toll.

3.16 Understanding the toll frequency gives insights into the nature of traffic plying on the Asset. CJVs generally have higher shares of return passes or local monthly passes because they travel for short to medium distances, while heavy trucks mostly have single tickets since they travel longer distances. Toll roads catering to short distance local traffic generally observe high shares of return tickets or other local monthly passes, while the other roads that cater to strategic long-distance traffic generally observe higher shares of single ticket traffic.

3.17 Table 3.5 below summarize the types of tickets being sold at TP Pampampallam.

Table 3.5: Typical ticket types sold at TP Pampampallam

Category	Description
Single	Allows the vehicle to cross the toll plaza once
Return	Allows the vehicle to cross the plaza twice in a day at discounted rates.
Monthly Pass	Discounted single ticket pass users issued at toll plaza for users who intend to undertake multiple single trips within a month. 50 trips are given at a discounted rate

Category	Description
Local Personal	Discounted single entry pass only for private cars of residents within 20km radius of toll plaza
Local Commercial	50% discount on single trips for commercial vehicles registered in the local district. This pass allows single entry only
Exemptions	Officially exempted vehicles like ambulance, police cars, key political personnel etc.

3.18 In addition to the above ticket categories, toll plazas generally also record violations, which are non-paying users, and who are not officially allowed under the exemptions category but are forced exemptions. For the Asset, the segmentation discussed below reports Exemptions and violations together.

Introduction of Annual pass for CJVs

3.19 The National Highway Authority of India launched the "The FASTag Annual Pass" on August 15, 2025, a prepaid facility that allows private CJVs to travel across designated National Highway and National Expressway toll plazas. The annual pass is worth INR 3,000. The pass is valid for one year or 200 trips, whichever occurs first and is applicable only to private, non-commercial vehicles (Car/Jeep/Vans).

Since this pass has been introduced by NHAI, it is not valid on

- state governed toll plazas on highways
- state governed toll plazas expressways
- Parking areas or other non-NHAI tolling locations

3.20 The pass can be activated via the RajmargYatra app or the NHAI website, and links directly to an existing FASTag. The Annual Pass aims to:

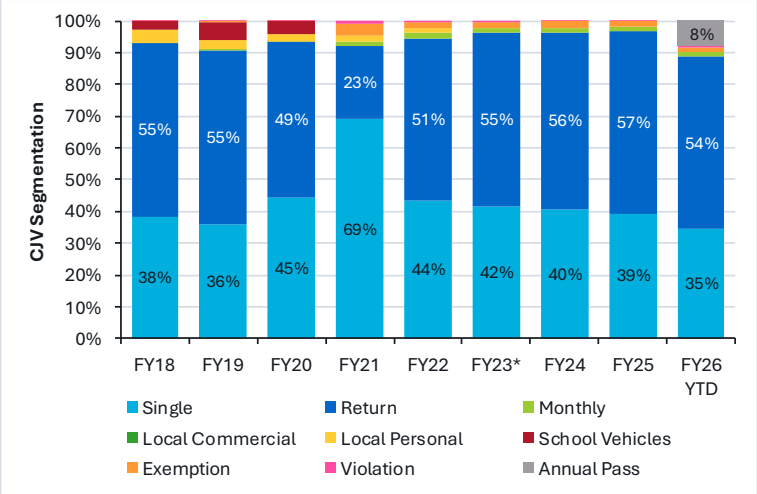
- Promote cashless and seamless travel on national highways.
- Reduce congestion and improve traffic flow at tolls

Share of traffic by payment type

3.21 In FY21, there was a change in ticket patterns across most toll roads in the country (including the Asset) due to the mandatory implementation of FASTag as a mode of payment for road users, as well as changes in travel behaviours induced by lockdowns due to the Covid-19 pandemic. As trip patterns stabilised from the mandatory implementation of FASTag, FY22 was further impacted by the 2nd wave of Covid-19 in Q1 and Q2, resulting in an extended period of travel disruption, where the share of shorter distance trips increased as several states implemented state entry barriers.

3.22 Figure 3-1 and Figure 3-2 below show ticket segmentation for CJV and MAV categories from FY18 to FY26YTD.

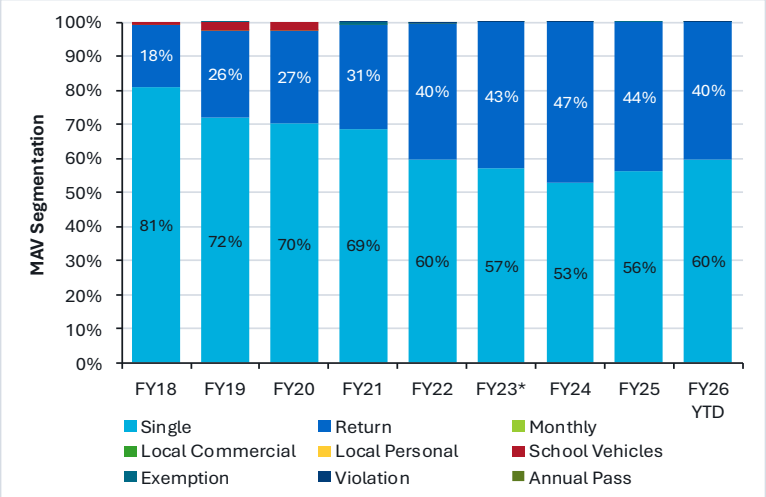
Figure 3-1: Ticket-segmentation for CJV at TP Pampampallam



Source: Steer analysis of the Client data; FY26YTD contains data from Apr- Feb'26; issuance of annual passes commenced from 15 August 2025

3.23 Over the historical period (except FY20-22 when Covid-19 and FASTag implementation resulted in changes to travel behavior), "Return" tickets formed the majority of CJV trips on the Asset, accounting for roughly 55-57% of the total every year. This is due to proximity of the Asset to densely populated centres such as Palakkad, Walayar, and Coimbatore.

Figure 3-2: Ticket-segmentation for MAV at TP Pampampallam



Source: Steer analysis of the Client data; FY26YTD is from Apr'25 to Feb'26

3.24 For MAVs, single journey tickets decreased from 69% to 53% between FY21 and FY24 and has risen to 60% as of FY26YTD. Over the same period, return journey tickets increased from 31% to 40%. This trend is due to various events in the state of Kerala:

- The closure of quarries after the expiration of permits in January 2024 [22]and illegal quarries being shut down by the Ministry of Environment and Forests (MoEF) in

[22] 300 quarries in state to be shut; Challenges for construction sector in Kerala

November 2024 has led to the setting-up of various dumping yards near Palakkad.[23] These dumping yards observe a high share of movement from areas like Coimbatore, which has also influenced the return share increasing year-on-year for MAVs on the Asset. Similar movement from Coimbatore is also observed for construction purposes, which caters to demand on alternate routes from our Asset.

- With the increasing ETC penetration, the share of return traffic has increased as the traffic which returns within 24-hour is eligible for return ticket automatically.

3.25 Table 3.6 below presents the FY26YTD (April to February) segmentation for LCV, Bus and 2A category.

Table 3.6: Ticket-segmentation for LV, Bus, 2A and 3A/MAV Categories at TP Pampampallam

Ticket Category	LCV	Bus	2A	3A/MAV
Single	36%	45%	56%	60%
Return	55%	28%	44%	40%
Monthly	-	-	-	-
Local Personal	9%	26%	-	0%
Violations	-	0%	-	-
Exemptions	0%	0%	0%	0%

Source: Steer analysis of the Client data

Data Collection exercise

3.26 To validate and inform various inputs used in our forecasting, we undertook primary data collection on the Assets, comprising the surveys listed in Table 3.7 below. OD survey data was collected on behalf of the Client, TVC surveys were commissioned by Steer with a third party. OD data collection typically involves manual data entry by enumerators based on oral surveys with road users crossing toll plazas, which Steer also commissioned with a third party. TVC data collection involves video-graphic capture of traffic passing crossing the toll plazas, followed by manual counting.

Table 3.7: Data collection schedule

3-day videography-based TVC			1-day OD survey			
Start date	End date	Time (hrs)	Start date	Start Time	End Date	End Time
10th Mar 2026	12th Mar 2026	0000-2359	10th Mar 2026	0900 hours	11th Mar 2026	0900 hours

Source: Steer analysis

3.27 It should be noted that, in our experience, traffic on national highways shows variation across the week due to the economic activities surrounding each road. To derive a representative TVC count considering daily variation, three-day to seven-day traffic

[23] MoEF Cracks Down on Illegal Quarries in Kerala with New EC Guidelines | Kochi News - Times of India

counts are generally recommended, and hence, to fully understand the impact of this weekly fluctuation on the Asset, we collected three-day counts at the toll plaza.

Key findings of the TVC data analysis

WADT estimates

3.28 Taking an average of the 3-day TVC counts (10th Mar – 12th Mar 2026, 0000-2359), we obtained the following average daily traffic (ADT). This ADT excludes non-tollable vehicles such as tractors, two-wheelers, bullock-carts, etc., but includes officially exempt vehicles such as police cars, ambulances, emergency response vehicles, government vehicles and other vehicle types officially allowed as 'exempted' under the concession agreement.

Table 3.8: ADT at TP Pampampallam

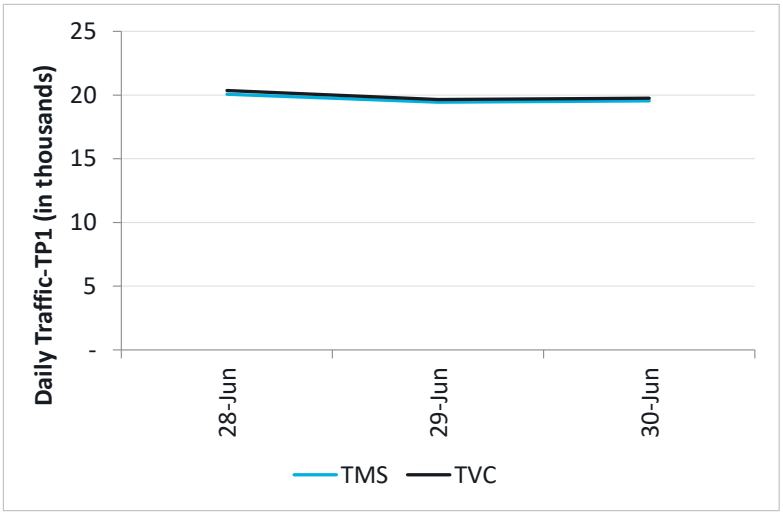
Toll Plaza	CJV	Mini LCV	LCV	Bus	2 Axle	3 Axle	MAV	OSV	Total
TP1 Pampampallam	9,819	2,582	3,256	1,169	1,620	655	3,177	1	**22,278**

Source: Steer analysis of TVC data

TVC v/s TMS analysis

3.29 As we use the TMS data to estimate the base year AADT, we have used our TVC data to validate the TMS data on those particular days, as provided by the Client. The following figures show the comparison between the daily traffic observed by TVC and TMS for the toll plaza.

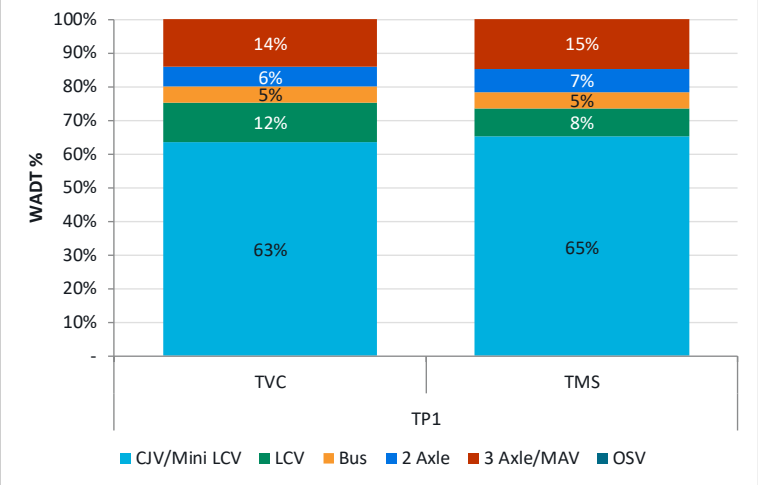
Figure 3-3: Comparison between TVC and TMS daily traffic data on TP Pampampallam



Source: Steer analysis of TVC and Client TMS data

3.30 As can be seen from Figure 3-3 above, the difference between daily traffic from both sources is minimal. Figure 3-4 below compares the shares of vehicle types at both toll plazas observed by the TVC and TMS data. In terms of individual vehicle categories as well, the difference is minimal (1-3%) which could be attributed to common misclassification of vehicle categories between CJV, Mini LCV, LCV and 2A.

Figure 3-4: Comparison between vehicle shares from TVC and TMS WADTs



Source: Steer analysis of TVC and Client TMS data

3.31 Considering the smaller variation between the TVC and TMS data for the largest revenue generators-CJV and 3A+MAVs, and an overall good fit in the traffic volumes, TVC-TMS analysis gives us the confidence that the base year traffic calculated using the Client data forms a reliable base year traffic estimate.

Key findings of the origin-destination analysis

Overview

3.32 Origin-destination (OD) analysis enables the understanding of the nature of traffic movement on the Asset. We have analysed the regional drivers of demand based on the following analysis:

- Zonal influence
- Commodity distribution
- Top OD pairs
- Trip length distribution

3.33 While zonal analysis and the list of top OD pairs help to understand 'where' people and goods travel, commodity distribution sheds light on 'what' goods get transported on this Asset. Trip length distribution shows 'how far' vehicles and people travel, and goods get transported. This set of analyses is used to estimate key drivers of traffic and aid in making informed forecasting assumptions related to traffic demand elasticities, growth drivers and exogenous impacts.

Sample rates

3.34 Sample rates help understand the reliability of OD data. They are calculated by dividing OD samples by the TVC count observed on the same date for each vehicle category at the toll plaza. Table 3.9 below presents the sample rates for key vehicle type aggregations at the toll plaza. We believe that the sample rates of the OD data are reasonable for the analysis required.

Table 3.9: Sample rates for OD data

Vehicle type	TP Pampampallam
Passenger (CJV+Bus)	28%
Goods (LCV+2A+3A+MAV+OSV)	53%

Source: Steer analysis of OD data

3.35 Low sample rates for passenger vehicles are due to short stop times at the toll plaza post implementation of FASTag where the queuing at plazas have decreased and time to record survey responses, especially for private vehicles (CJVs) have also reduced.

Zone Categories

3.36 To facilitate better interpretation of key regional drivers of traffic as determined by their OD zones, and influenced by various towns, cities, states, and regions in the vicinity of the Asset, we have aggregated zonal data as described Table 3.10 below. The methodology behind this aggregation of zones may vary as per the characteristics displayed by the different Assets being studied.

Table 3.10: Zone aggregations for zonal influence analysis

Aggregate Zone	Description
Local	Local zones are those that fall on or very close to the Asset.
IAOI (Immediate Area of Influence)	IAOI zones are the locations which generate traffic and lie within approximately 75-150 km distance from the Asset.
Rest of State (RoS)	Rest of the cities/Districts in the state that Asset lies in (other than Local/IAOI)
Tamil Nadu	Parts of Tamil Nadu not belonging to local or IAOI aggregations
Karnataka	Karnataka
North India	Uttarakhand, Uttar Pradesh, Rajasthan, Delhi, Haryana, Punjab, Jammu and Kashmir
Central India	Madhya Pradesh, Chhattisgarh
West India	Gujarat, Maharashtra, Goa
Rest of South India	South Indian states other than Kerala, Karnataka, and Tamil Nadu
East & Northeast India	West Bengal, Bihar, Orissa, Jharkhand, and Northeast Indian states

Source: Steer analysis

Zonal influence

3.37 The zonal influence is the contribution of the zone or the zonal aggregation to trips on the Asset for a given vehicle type. This section presents the zonal influence of these zones/zone aggregates on the Asset as retrieved from the OD survey data, and as based on zonal aggregation list presented in Table 3.10 above. [24] It should be noted that zonal

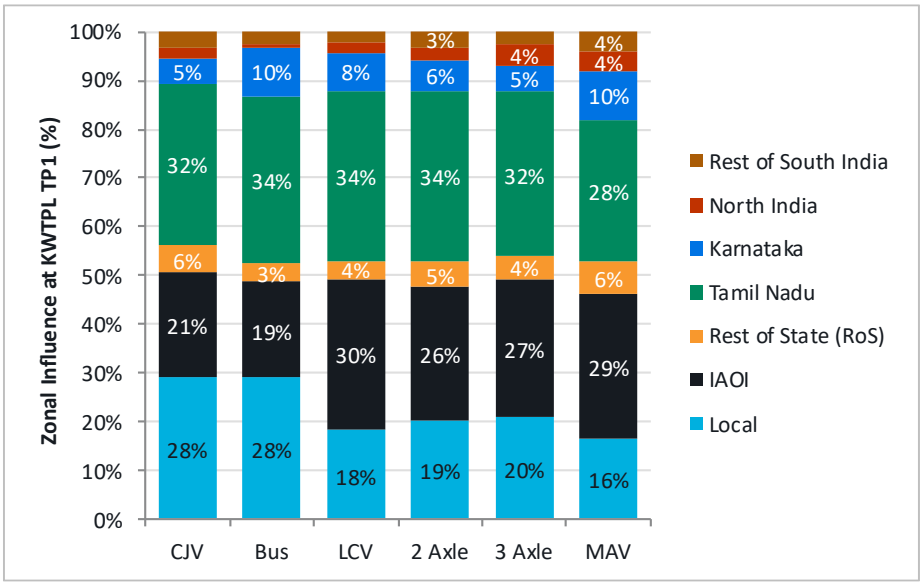
[24] For example, if out of 100 trips at a toll plaza on an Asset, 10 trips are between Hyderabad and Delhi and 90 trips are between Hyderabad and Chennai, then zonal influence of Hyderabad would be 50% since one end of all trips are at Hyderabad. Likewise, zonal influence of Delhi and Chennai would be 5% and 45%, respectively.

influence is analysed on trip ends and not trips. The zonal Influence analysis outputs are presented in Figure 3-5 below.

3.38 As the Asset is located on the border of Kerala and Tamil Nadu and serves as the gateway to the former, we see a large proportion of trips across all vehicle categories influenced by locations in Kerala. There is a higher share of local trips for the passenger vehicles wherein more than 49% of the influence for CJVs is from local and IAOI zones such as Walayar, Coimbatore, Thrissur and other areas in Palakkad district. This analysis is in line with our understanding during the site visit wherein heavy influence of the surrounding local areas was observed on passenger traffic volumes. Light goods traffic is significantly influenced by local and IAOI areas such as Coimbatore, Thrissur and Annur whereas the heavy goods traffic had a relatively greater influence of medium distant locations like Rest of South India and Karnataka. As the number of axles increase the influence of local areas on traffic volumes on the Asset decrease.

3.39 Outside Kerala, areas in Tamil Nadu such as Salem, Chennai, Thanjavur and Erode contribute to both light and heavy goods traffic on the Asset, followed by Bangalore in Karnataka. Supporting this analysis, the top OD pairs analysis (see Top 10 OD Pairs) shows that the majority of passenger trips originate and end in local and IAOI areas whereas for goods traffic, the rest of the state and areas outside the state such as Ernakulam, Bangalore and Salem feature in the top OD pairs list.

Figure 3-5: Zonal influence at TP Pampampallam



Source: Steer analysis of OD data

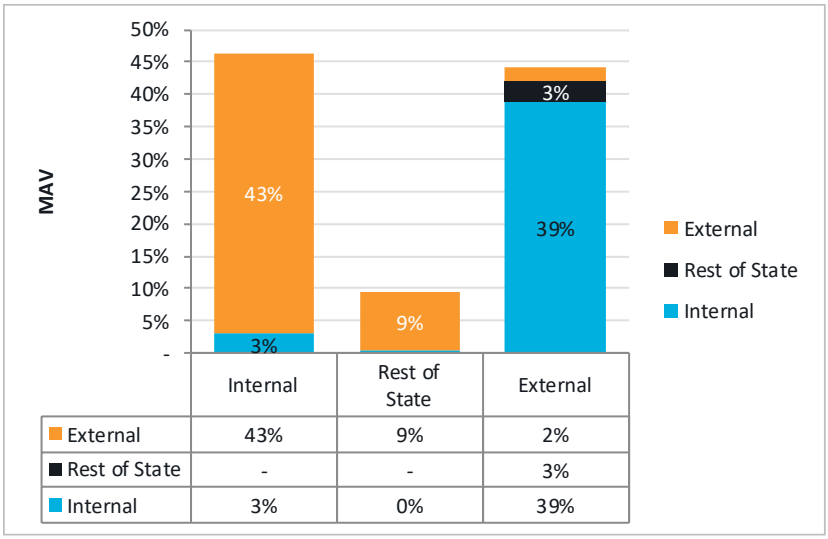
Internal External analysis

3.40 Internal-External analysis helps in identifying the trips which have both an origin and destination on or near the Asset i.e., local/IAOI zones (Internal-Internal or I-I), any one end on the Asset (Internal-External or I-E), or neither end on the Asset i.e., through trips (External-External or E-E). RoS here represents areas within the state which are neither local nor IAOI. 'Internal' zones are those that were analysed as 'local' and 'IAOI' in the zonal influence analysis, i.e., lying on the Asset, while 'External' zones are areas lying outside the state.

3.41 Figure 3-6 below shows the distribution of trips based on the categories described above. The results from the I-E analysis support our observations from the zonal influence analysis presented above, but at a higher level of aggregation. The following observations can be made from the I-E analysis:

1. Overall, a significant share (52%) of the MAVs originates from external areas and end their trips in Kerala which could be attributed to Kerala's dependency on other states for meeting its consumption demand. Similarly, 39% of the MAV traffic has its origin within the Local areas and are destined for places in external areas such as Tamil Nadu and Karnataka.
2. External to external movement accounts for a small share of overall MAV traffic on the Asset, highlighting that the Asset is primarily used by the vehicles which have one end in the state, with minimal through movement.

Figure 3-6: Internal-external distribution at TP Pampampallam



Source: Steer analysis of OD data

Commodity distribution

3.42 We have grouped various commodities into aggregate categories for ease of interpretation, as shown in Table 3.11 below. Figure 3-7 below presents the outputs of the commodity distribution analysis at the aggregated commodity categories.

Table 3.11: Aggregate commodity categories

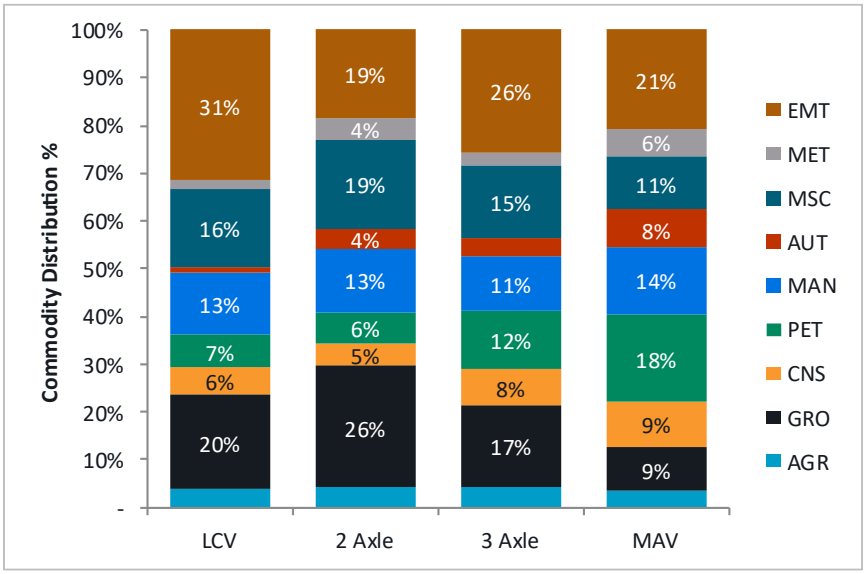
Commodity Description	Code	Combined codes used for charts
Agriculture Products / Cash crops (Wheat, Rice, Sugar cane, Maize etc.)	AGR	AGR
Cattle Food / Live Stock (sheep, goat, cow, cattle food etc)	LIV	
Perishable Items (Fruits, vegetables)	PER	GRO
Animal Products/Dairy/Eggs/Fish/Meat/Animals	DFM	
Groceries / Food items (Soap, Salt, Sugar, Pulses, Spices, Biscuits, bread, cold drinks, beer etc.)	GRO	

Commodity Description	Code	Combined codes used for charts
Building Material / Construction (Cement, Lime, Brick, fly ash, etc)	CNS	CNS
Sand/Clay	SND	
Stone (kota stone, marble, Granite, Aggregate stone etc.)	STN	
Ceramic	CRM	
Petroleum Products (Oil, LPG, CNG, etc.)	PET	PET
Chemicals / Fertilizers (Acids, Fertilizers etc.)	CHM	
Electrical/Manufacturing items (Electronic items, Medicine, Leather, Wine, Rubber/ Tyre, Plastics, Cloth, Paper etc.)	MAN	MAN
Raw Wood, Cork & Wood Products, Furn	WUD	
Machinery / Spare parts	MAC	
Automobiles (Finished products, auto parts, Car/bike manufacturing, New Chassis)	AUT	AUT
Basic / Fabricated Metals (Iron, Steel / Metal)	MET	MET
Mining Minerals (Coal, Gypsum, Cobalt etc.)	MIN	
Empty	EMT	EMT
Container	CTR	MSC
Miscellaneous (Parcel, Courier, Household items etc.)	MSC	
Passengers	PAS	
Scrap	SCR	

Source: Steer Analysis

3.43 The dominant commodities moved by 3As and MAVs include groceries (17% and 9% respectively) and manufactured items like plastic, paper & medicines. Around 18% of MAVs use the Asset to transport petroleum products. A considerable proportion (9%) of MAVs that carried cement and other construction materials on the Asset can be attributed to the presence of the state-owned Malabar Cement plant at Walayar and various other units such as ACC cements along the Asset alignment. Agricultural and grocery items, largely consisting of household products were the key commodities moved by LCVs on the Asset and accounted for roughly 24% of the total.

Figure 3-7: Commodity distribution at TP Pampampallam (Total)



Source: Steer analysis of OD data

3.44 Looking by direction, it is seen that around 30-40% of the goods traffic is empty while travelling towards Coimbatore whereas those going in the direction of Palakkad carry a mixture of commodities with the largest proportion of the light goods vehicles transporting groceries and agricultural products. The heavy goods vehicles, on the other hand, are observed to have carried construction material, manufacturing items and cement.

3.45 The difference in the characteristics of direction-wise commodity distribution can be attributed to Kerala's dependency on other states for meeting its demand for agricultural products and construction material. The commodity distribution shows that 15% of the MAV's carry construction related goods in the direction of Palakkad (**Error! Reference s ource not found.**)compared to 2% of the MAV's moving towards Coimbatore (**Error! Reference source not found.**). This directionality in construction related traffic is due to the presence of the Malabar Cement plant in Walayar and ACC cement plant in Madukkarai near the plaza.

3.46 The proportion of trucks carrying petroleum products on the asset (18%). This high proportion of petroleum is travelling from the refineries in Kanjikode Industrial Area which is situated near the asset to the industrial centres of Coimbatore.

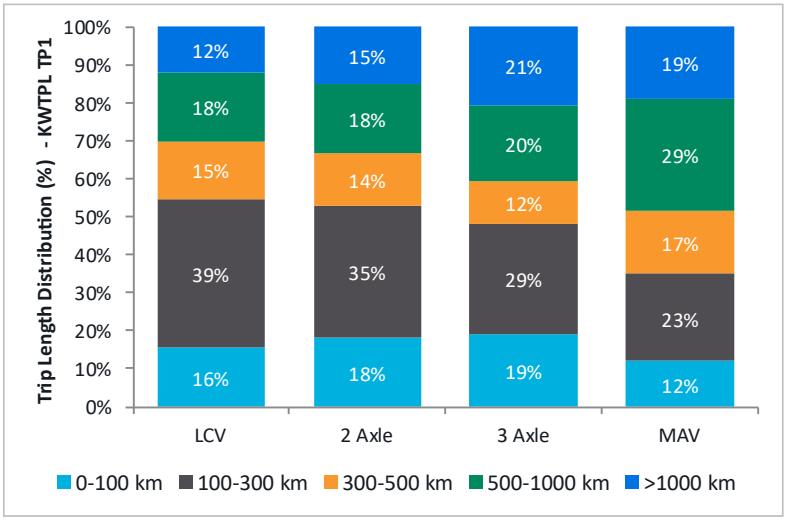
Trip length analysis

3.47 Trip-length distribution provides the distance-based trip profiles of various vehicle categories. This aids in validating assumptions around the share of macro-economic drivers, inputs from our zonal influence analysis and toll segmentation. For ease of interpretation, we have categorised distances into 5 groups – local (0-100km), short-distance (100-300 km), medium-distance (300-500 km), long-distance (500-1000 km) and

very-long-distance (+1,000 km). The trip distances were derived as driving distances from Google Distance Matrix Tool based on zonal coordinates for OD pairs.[25]

3.48 Supporting the observations made in the zonal and internal-external analysis in the previous sections, Figure 3-6 below highlights that the Asset primarily caters to short and medium distance trips. More than 35%-50% of heavy goods vehicles (3 axles & MAVs) travel shorter distances (<300 kms), contributing to the local movement observed on the Asset. This rises to ~55% for the LCVs. This local and short distance nature of traffic on the Asset is also observed from the average trip lengths shown in Table 3.12 below.

Figure 3-8: Trip length distribution TP Pampampallam



Source: Steer analysis of OD data

Table 3.12: Average Trip Length

	LCV	2 Axle	3 Axle	MAV
Average trip length Km	388	468	570	596

Source: Steer Analysis of OD data

Conclusions

3.49 In summary, the Asset's AADT in FY25 at Pampampallam toll plaza was 22,905 in terms of absolute traffic volumes and 37,117 in terms of PCUs. The Asset has witnessed significant growth in recent years (AADT PCU CAGRs of 6.5% between FY18-25 and 13.8% between FY22-25). This growth has been bolstered by positive impacts of the underlying economic activities driving traffic on the Asset – tourism, port-related movement and the influence of construction material.

3.50 The 3A/MAV category has observed a degrowth of 5.7% in FY26YTD. This is due to the continued slowdown in movement of construction material from Tamil Nadu after the introduction of the border tax in FY23, and a recent crackdown on illegal sand mining in

[25] Google Distance API is a tool that is available on a chargeable basis from Google Maps Platform. Link: **https://developers.google.com/maps/documentation/distance-matrix/start**. Travel distance and time information for driving/transit under various congestion scenarios can be extracted through this tool by using macro-enabled Excel, R, etc.

Tamil Nadu, which has reduced the availability of transportable construction material to Kerala. However, we expect these trends to stabilise over the near term and construction material related traffic to recover as demand for construction material will remain strong in Kerala going forward

3.51 The TVC data shows minor variation on the TMS data, where at a total level, the TVC data is approximately 1.2% higher than the TMS data. Higher difference at vehicle category is due to mis classification between CJV, Mini LCV, 2A and Bus.

3.52 The OD analysis found that in terms of the zonal influence, local and IAOI areas such as Walayar and Coimbatore highly influence the movement of passenger traffic on the Asset whereas the heavy goods vehicle traffic is significantly influenced by areas in the Rest of the State such as Kochi, Thiruvananthapuram, and Ernakulam. Outside Kerala, states such as Tamil Nadu and Karnataka have a high influence on the movement of both light and heavy goods traffic on the Asset. The internal and external distribution highlights that majority of the passenger traffic originates from and is destined to places within the internal areas i.e., local and IAOI zones thereby contributing to the local movement on the Asset whereas a high proportion of heavy goods vehicle originate from external areas and end their trips in Kerala.

3.53 The key commodities transported on the Asset includes manufacturing items such as rubber, container, petroleum, groceries, plastic as well as construction goods like cement for the heavy goods traffic and grocery/agricultural items by light goods vehicle. It is also observed that a higher share of vehicles across all categories are empty travelling towards Coimbatore whereas given Kerala's high consumption demand, which is met by other states, there is a higher share of traffic carrying a mix of commodities including cement towards Palakkad, due to the presence of the Malabar Cement plant in Walayar. This is consistent with the underlying economic trends where Kerala is predominantly a destination for various consumption linked commodities as it has relatively few industries located there.

4 Socioeconomic context and traffic growth

Introduction

4.1 The growth of traffic on existing (brownfield) roads depends on, firstly, how fast the background travel demand grows (background growth); and secondly, how successful the Asset is in attracting that traffic (traffic capture). Background travel demand is driven by the socio-economic conditions of the region where the Asset is located and conditions on a national scale. These include:

- Changes in factors such as population, economic growth (regional and national) and industrial production; and
- Other local factors such as strategic port growth, and growth in local industries near the Asset.

4.2 In turn, the change in the competitive position of the Asset (and thus of the traffic capture it will achieve) derives from how the service offered and the prices charged on the Asset change in comparison to competing roads; and whether any new competing road facilities are available. In this chapter, we assess the socio-economic indicators relevant to traffic growth on the Asset.

Population growth

4.3 We have analysed the key socioeconomic drivers of the background traffic demand in the state of Kerala where the Asset is located.

National Level

4.4 Table 4.1 below shows that the total population in India has grown at a Compound Annual Growth Rate (CAGR) of 1.5% since 2000, decreasing over the years, as shown in the table below. The World Bank forecasts this growth to decrease to 0.6% CAGR by the 2030-45 period.

Table 4.1: CAGR of population in India

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
1970 – 1985	2.3%	1.9%	3.8%
1985 – 2000	2.0%	1.7%	2.9%
2000 – 2015	1.5%	1.0%	2.6%
2015 – 2030*	1.0%	0.3%	2.3%

Years	CAGR		
	Total Population (m)	Rural Population (m)	Urban Population (m)
2030 – 2045*	0.6%	-0.3%	1.9%

Source: World Bank Data on Health Nutrition and Population Statistics, *forecast population growth

State Level

4.5 Table 4.2 shows the evolution of population in Kerela state, compared to that of the country. The CAGR of population in Kerela has been considerably slower vis-à-vis that of India.

Table 4.2: Population Growth in Kerala and India (FY12 – FY24)

State	FY12 Population (m)	FY24 Population (m)	CAGR (FY12 – FY24)
Kerala	33.5	36.1	**0.6%**
India	1,210	1,395	**1.2%**

Source: MoSPI estimates

4.6 Due to the complexities of patterns of urbanisation, and the very dynamic nature of local population migration (which are very difficult to forecast with accuracy), we do not use population growth as a proxy for understanding future travel demand growth on the Asset. It has been included in this section simply to provide the underlying socio-economic context of the state/trends in the regions in which the Asset is located.

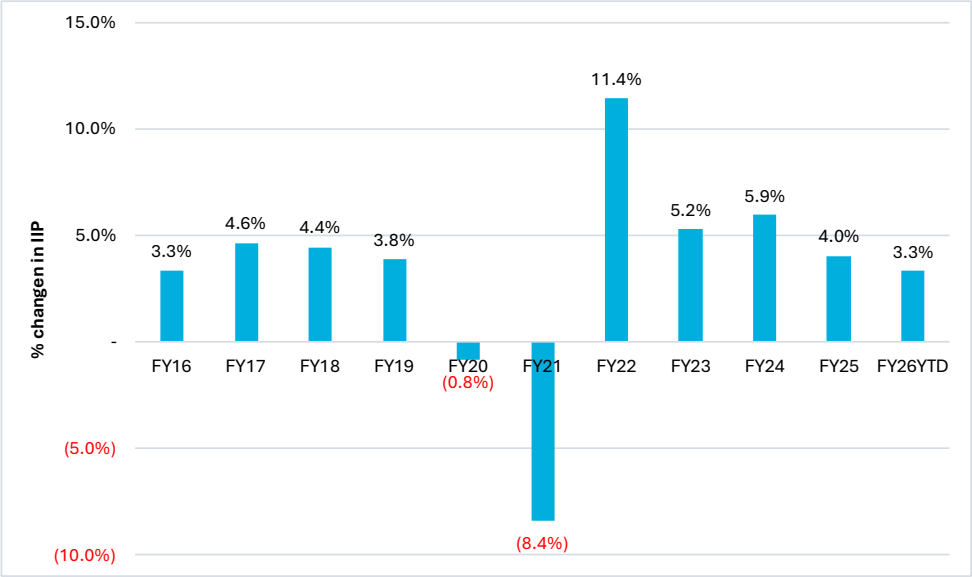
Economic Indicators

Industrial Production

4.7 The Index of Industrial Production (IIP) is a composite indicator that measures the short-term changes in the volume of production for a basket of industrial products. The IIP data tracks the manufacturing activity in different sectors of an economy, with mining, manufacturing, and electricity being the three broad sectors constituting the IIP.

4.8 Figure 4-1 below that at an annual level, national IIP was growing at an average of 4% per year over the period FY15-19, before the country underwent a liquidity crisis and experienced an overall economic slowdown in FY20. In the aftermath, IIP shrank by over 8% in FY21 due to a decline in economic activity in the wake of global lockdowns introduced to curb the Covid-19 pandemic. Post the immediate recovery in FY22, IIP growth has since stabilised, with FY25 recording 4%, and FY26YTD (till February 2026) recording 3.3% growth over FY25.

Figure 4-1: Annual growth – Index of Industrial Production



Source: Steer Analysis of MoSPI data

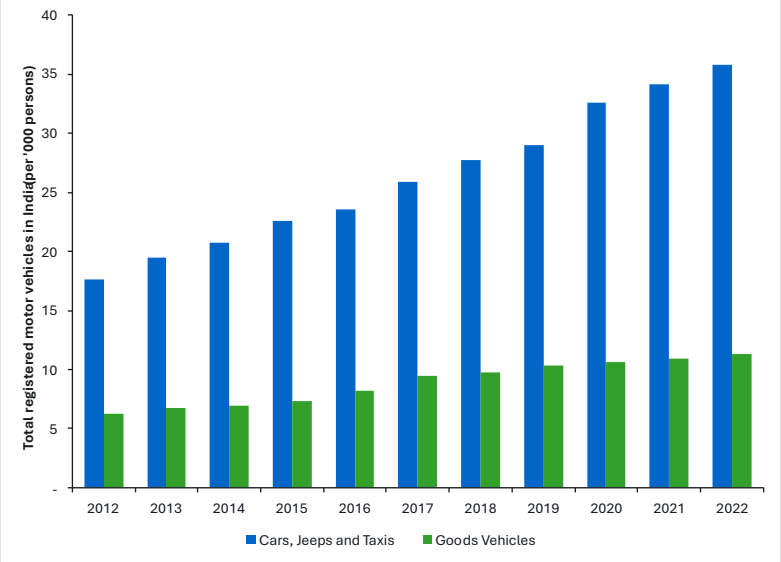
4.9 Since state-level IIP data is not as readily available as national level IIP, we have presented national IIP here to indicate nationwide activity in key industrial sectors like power, manufacturing, and mining, all of which influence long-distance commercial movements across the nation, and not unique to this asset. We, however, do not use it to forecast future travel demand growth since long-term forecast for IIP is not available through official sources such as MOSPI, RBI or through multilateral organisations like WB, IMF.

Vehicle Ownership

4.10 The gap in car ownership between India and developed nations remains substantial – with 36 cars/jeeps/taxis and 11 commercial vehicles per thousand people, as of FY22 (the latest year for which official data is available). However, with increasing per capita income levels, a booming economy and the subsequent increase in demand for mobility, the number of registered vehicles has been on a gradual upward trend

4.11 Overall, India still stands at a very nascent stage in the vehicle saturation curve, offering huge potential for growth going forward. Between FY12 and FY22, the CAGR for CJV and goods' vehicles registered in India was 8.6% and 7.3% respectively.

Figure 4-2: Total number of registered motor vehicles in India (per 1000 population

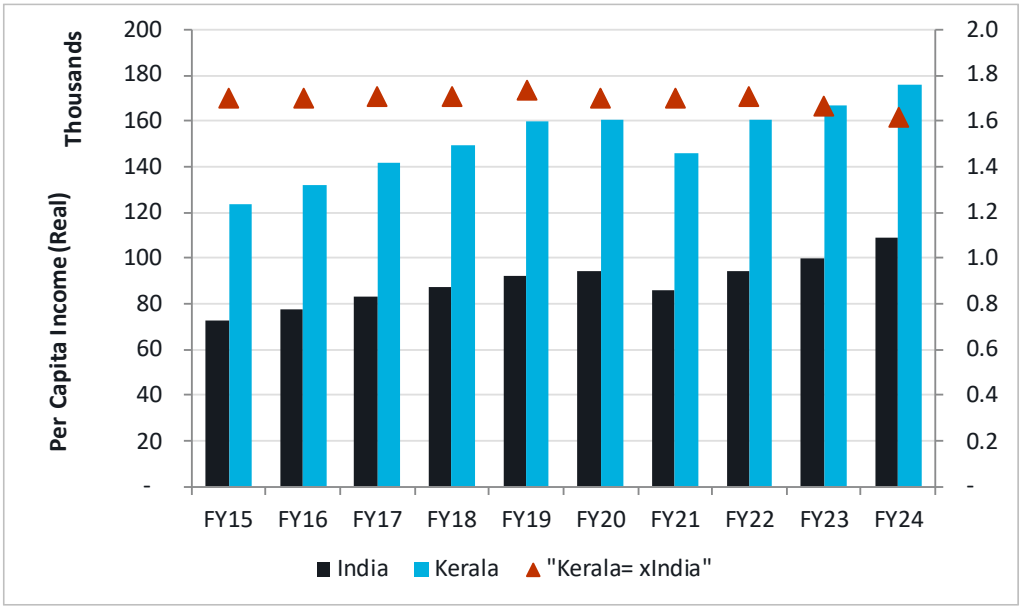


Source: International Energy Agency (IEA))

Per Capita Income (PCI)

4.12 Kerala is one of the richer states of India whose per capita income has been consistently higher than the national average as seen in the Figure 4-3 below. As of FY24, the per capita income of the state was approximately 1.6 times that of the national average.

Figure 4-3: Per Capita Income in Kerala and India (FY15 – FY24)



Source: Steer Analysis of MoSPI data

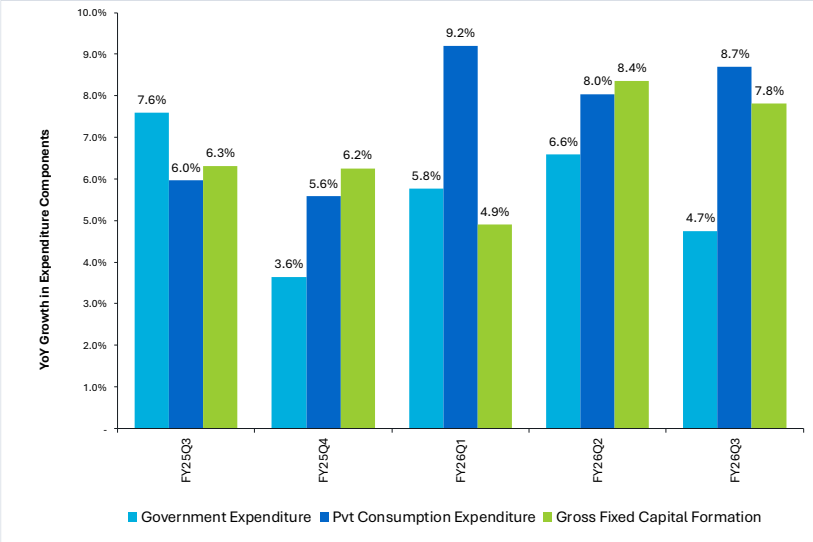
Economic Growth

India's Performance

4.13 Despite a slowdown in the economy during H1FY25, the Indian economy has observed strong growth each quarter since FY25Q2, with the latest published estimates for FY26Q3 GDP at 7.8% over FY25Q3. This performance has been driven by strong growth in investment and consumption expenditures and higher consumer optimism for the year ahead[26].

The figure below, we present quarterly Y-o-Y growth in three major components of GDP – government expenditures, consumption expenditures, and business investment (gross fixed capital expenditure) over the past year (FY25Q3-FY26Q3).

Figure 4-4: YoY growth in expenditure components of GDP



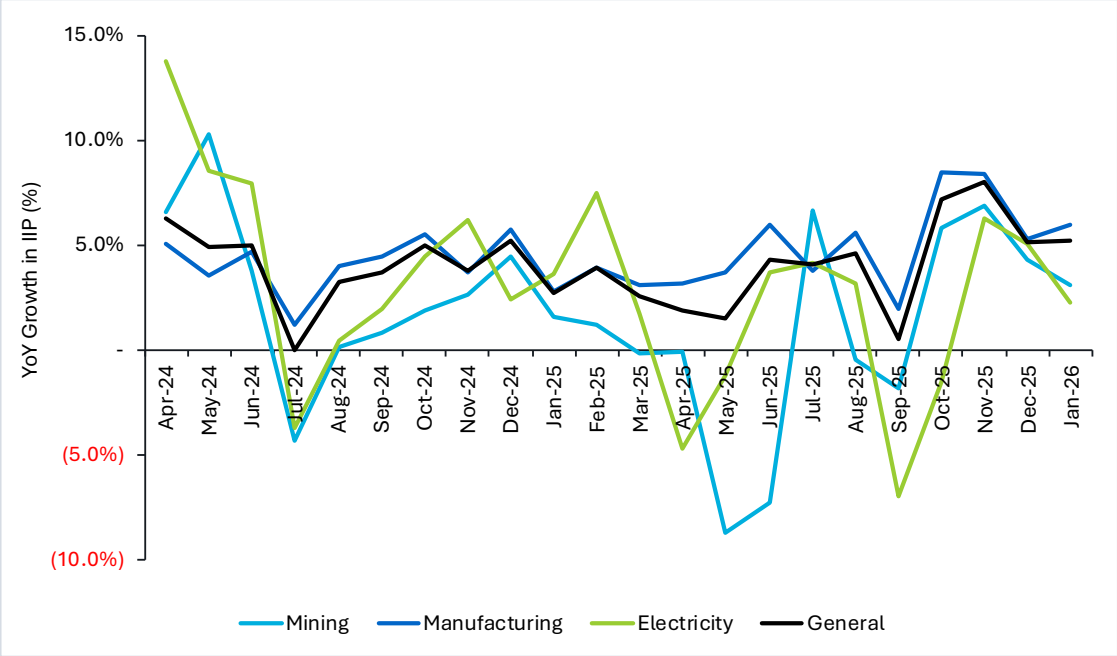
Source: Steer Analysis of MOSPI Data

4.14 While consumption and investment expenditures have continued to show consistent growth over the past two quarters, government expenditures observed a marginal decline in FY25Q4. In FY26Q1, government expenditures rebounded, recording 5.8% growth over FY25Q1 levels.

4.15 Performance across different types of industrial activities (such as Mining, Manufacturing, and Power Generation) directly impact freight movement and commercial traffic volume growth across the country, including on the Asset. In the figure below, we present growth trends in IIP – a measure that tracks the performance of the economy across these activities. As of FY26YTD (Apr'25-Feb '26), the Manufacturing sector continues to perform strongly, recording positive y-o-y growth since FY25Q3. While industrial activity across the two other sectors (i.e., Power Generation and Mining) dropped between May and Jun/Jul '25, they have since rebounded and show signs of continued growth going forward.

[26] Gov**ernment of India PIB Release (27th February 2026)**

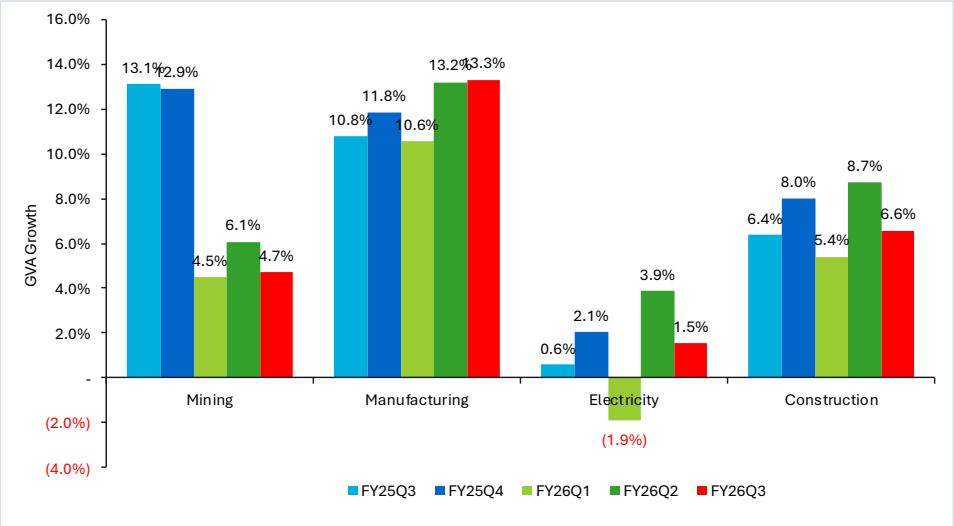
Figure 4-5: Month on Month IIP performance



Source: Steer Analysis of MOSPI Data

4.16 In addition to monthly trends in IIP, the figure below presents y-o-y growth of quarterly GVA in four industrial sectors - Mining (& Quarrying), Manufacturing, Electricity (and other Utilities), and Construction. While the Mining and Power sectors observed decline and muted growth in FY26Q1, the Manufacturing and Construction sectors experienced strong growth. While overall economic growth has remained resilient as of FY26YTD, performance across industries have varied, impacting economic growth across different regions and on the Asset as well.

Figure 4-6: Industrial components of GVA



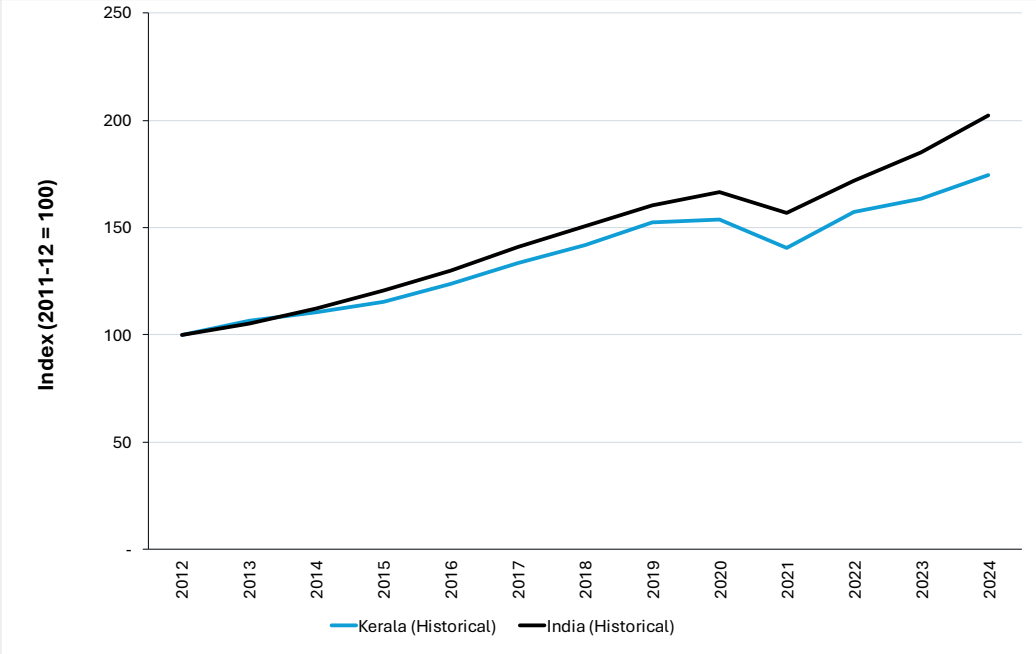
Source: Steer Analysis of MOSPI Data

GDP and GSDP Growth

4.17 Figure 4-7 below illustrates the evolution of Kerala GSDP, with respect to the GDP of India. Between the period of FY12 and FY24, the Indian economy has grown at a CAGR of 6.0%- aided by a strong growth in the services/tertiary sector, which grew at a CAGR of 6.9% over the same period. Kerala grew at 4.7% between FY12 and FY24, with the state growing at a slower rate than the national average.

4.18 As shown in Table 4.2 above, Kerala accounted for 2.6% of national population in FY24. In terms of national economic contribution, Kerala contributed approximately 3.6% to India's GDP in FY24. Therefore, Kerala's per capita GDP contribution highlights the importance of the region in driving consumption demand and regional traffic growth near the Asset.

Figure 4-7: Evolution of Kerala's state GDP and national GDP, FY12-24



Source: Ministry of Statistics and Program Implementation

Economic activity in the state

4.19 Kerala is a relatively small state situated in Southern India with an area of 38,863 sq.km and a population of 3.61 crore people. The share of primary sector in the state's economy has declined over the years – from 15.2% in FY12 to 8.5% in FY24, but it is a leading producer of cash crops such as coconut, rubber, coffee, pepper, cashew, and tea. Other key agricultural products include spices such as cardamom, vanilla, nutmeg, and cinnamon.[27]

4.20 Kerela is a relatively high-income state with per capita GSDP 62% higher than the national average as per 2024 estimates[5]. Services is a dominant contributor to the State's incomes, with over 60% contribution to GSDP. Leading contributors to this sector include

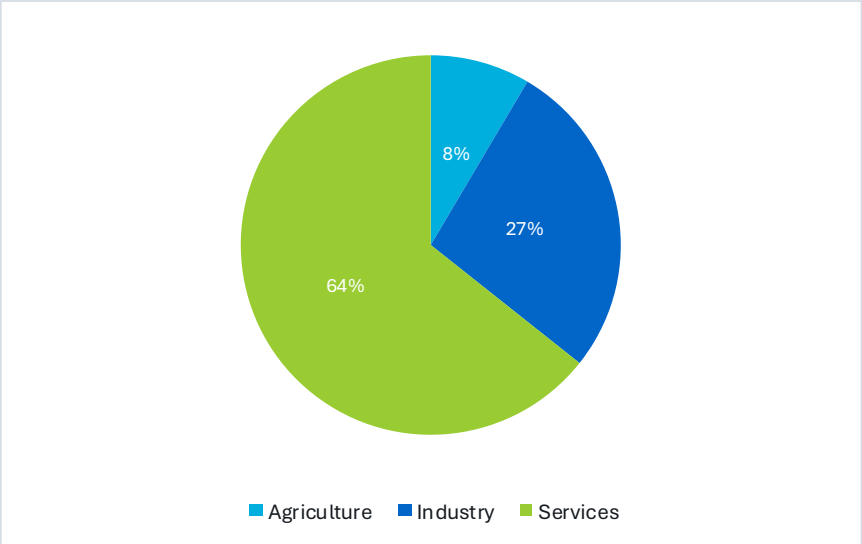
[27] Economic Review 2024 - Government of Kerala

tourism, Ayurveda and medicinal services, pilgrimage, IT services, financial services, and education.

4.21 Major containerised traffic is routed through Cochin port and dispatched to final destinations via road. Cochin port handled total traffic of 36 million tonnes in FY24 (Table 2.3) Tea, coffee, cashew kernels, seafood, coir products and spices are major commodities exported via the port. The port also handles major import items for the State such as fertilisers, raw materials, iron and steel products, machinery and petroleum, oil and lubricants (POL).

4.22 In terms of sectoral contribution, the services sector is the biggest contributor (64%), followed by secondary (27%) and primary sector (8%), as of FY24[5]

Figure 4-8: Sectoral contribution to Kerala's GSDP in FY24



Source: Steer Analysis of MoSPI data

4.23 The official historical GDP and GSDP data for India are released by the Steer Analysis of MoSPI data. The GDP forecasts for India are available from various reliable sources such as Oxford Economics and Consensus Economics[28], but state-specific GSDP forecasts are not published by any such sources. To derive state GSDP forecasts, we rely on past trends of the relationship between GDP and GSDP and develop GSDP forecasts as a function of our assumed GDP forecasts[29].

4.24 For any indicator to be used as a growth driver to forecast traffic, a reliable source of historical and forecast data availability for that indicator is the key requirement. Of the key socioeconomic indicators discussed above, GDP was assessed to be the only growth driver for which reliable data is available both in terms of historical and forecast data. Therefore, to forecast traffic, we use GDP/GSDP as our key growth drivers.

---

[28] **Consensus Economics - Economic Forecasts and Indicators**

[29] Assuming that the historical long-term relationship between GSDP and GDP sustains over the short-term, we project future growth in GSDP as a function of our GDP growth forecast. We taper the relationship of GSDP growth to converge to GDP growth gradually over the long-term.

Forecasts for growth drivers

4.25 Following the discussion in Chapter 4 on the nature of economic activity in the state of Kerala, in this section, we describe the assumptions in relation to forecasts of the key macro-economic drivers of traffic growth.

4.26 We have based our forecast of the GSDP for Kerala based on the forecasts of the GDP of India as provided by the Client.

National GDP

4.27 After the last period of economic slowdown in FY11-12, the country experienced an economic downturn again in late FY19 with FY20 having reported a GDP growth of 4% (relative to an average growth rate of 7% per year between FY13 and FY19). India's GDP growth declined as domestic investment and consumption demand were already under stress because of the liquidity crunch before Covid-19. Other factors that contributed to the economic slowdown included reduced growth rates in automobile sales and production, liquidity crunch in credit markets and rising number of Non-Performing Assets (NPAs) within the banking sector, as well as lower manufacturing production and lower rural consumption.[30]

4.28 The Covid-19 outbreak had a significant impact on the Indian economy during the first two quarters of FY21 as government mandated lockdowns across the country effectively stalled economic activity and growth. The growth momentum eventually picked up in Q3 of FY21, with a sharp rebound in the economy in FY22 (GDP recorded 9.7% growth over FY21) and has since observed a consistent growth of 7.6% in FY23 and 9.2% in FY24.

4.29 Figure 4-8 below shows Client-provided GDP projections for India. The forecast provided projects the Indian GDP to grow at 6.5% between FY27-FY28 and gradually tapering down to 5.2% by FY38. The GDP growth forecast is broadly in line with other independent forecasts available from reliable sources such as IMF, World Bank and RBI in the medium term.

4.30 We have assumed the GSDP growth of Kerala to continue to stay below the national GDP throughout the concession period. There has been increasing government expenditure and push towards infrastructure development in southern India. This is expected to push the economy of the region and lead Tamil Nadu to grow faster than the national growth in the next 15 years.

[30] **Data | India's GDP was on a downward slope even before COVID-19 wreaked havoc - The Hindu** (September 2020)

Figure 4-9: GDP-GSDP forecast

5 FY26 Base year AADT and Traffic growth Analysis

Introduction

5.1 In this section, we present our approach, assumptions, and results for base (or background) traffic growth for each vehicle category on the Asset.

5.2 Traffic growth is commonly related to a variety of macro-economic and industry- or commodity-specific factors (hereafter referred to as 'traffic growth drivers'). These growth drivers are typically identified from the results of the OD data analysis and the site visits that help us appreciate the nature of traffic movement – 'what' travels 'where' and 'why'.

5.3 To understand the historical traffic trends in relation to these growth drivers, we carry out regression analyses to determine the historical relationship between each traffic belonging to each major vehicle category and its macroeconomic growth driver at each toll plaza. The dynamics of traffic demand is the dependent variable while the dynamics of one or more identified growth drivers are the independent or explanatory variables. Typically, passenger and light commercial vehicles like Cars, Buses, LCVs and 2-axle trucks grow in line with the GSDP of the state where the toll road is located. Heavy vehicle traffic like 3-axle trucks and MAVs grow in line with the national GDP. This is because most light vehicles tend to travel shorter distances within the state, whereas a significant proportion of heavy vehicles carry commodities for long-distances across the country. These commodities also tend to be part of industry ecosystems whose demand-supply relationships are scattered across the country and therefore relate more with GDP growth.

FY26 Base year AADT estimates

5.4 The base year is the year on which long-term background forecast growth rates are applied to derive year-wise average annual daily traffic (AADT) estimates for forecast years. This is therefore an important aspect of our forecasting approach as traffic and ultimately revenue forecasts for future years are built on top of the base year traffic estimate. We have used FY26 as the base year for AADT estimates for the forecast years.

5.5 As described previously in Chapter 3; to establish the base year (FY26) traffic position, we utilized information from various sources – including from the Client and our context knowledge, to assess a reasonable demand on the corridor.

Methodology

5.6 The base traffic for FY26 has been estimated using 11 months of actual traffic data (April to February). The toll plaza's seasonality correction factors was applied on the actual

MADTs of Apr-25 to Feb-26 to obtain seasonally corrected estimates for FY26 traffic. An average of these estimates was considered to be the FY26 base traffic.

Seasonality Correction factors

5.7 Traffic on any Asset varies on a month-on-month level. Such variations maybe due to monsoons (typically Jul to Sept) or due to festivals in the region. For e.g. It is observed that typically the truck traffic during the first half of the financial year (April-September) is generally lower than the annual average, mainly because of peak summer season followed by monsoons affecting the freight movement patterns in large parts of the country in the July-September period. In addition to these there may be other seasonal variations specific to the Asset.

5.8 In order to normalise for these variations across the year to provide an AADT estimate, Seasonality Correction Factors (SCF) are used. SCFs are estimated to convert the monthly traffic numbers to an AADT level while accounting for seasonal variation due to local/national festivals, weather changes and/or temporary external impacts. These are typically estimated using historical data for each plaza and vehicle category over multiple years. An SCF >1 means that the traffic for the month is lower than the annual average and vice-versa.

5.9 To achieve this, we studied the seasonality between monthly average daily traffic (MADT) – We have analysed the seasonality trends between monthly average daily traffic (MADT) and AADT for data during the historical years of tolling excluding the years that were impacted by specific events. This averaged seasonality trend is then applied to the monthly traffic to obtain AADT as mentioned in the previous sections.

5.10 Table 5.1 below presents the average of the FY23 and FY25 SCFs, used to arrive at the FY26 base estimates (only FY23 SCFs were used for LCV and Bus categories).

Table 5.1: Seasonality correction factors for TP1 Pampampallam

Vehicle	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Mar
CJV	1.03	0.94	1.04	1.08	1.05	0.97	1.00	1.02	0.87	0.92	1.04	1.11
LCV	0.98	1.05	1.04	1.07	0.99	1.02	1.07	0.99	0.97	0.98	0.94	0.92
Bus	1.06	0.93	1.07	1.10	1.10	1.03	1.01	0.95	0.90	0.94	0.96	0.99
2A	1.04	1.05	0.99	0.99	0.94	1.00	1.05	1.03	1.01	1.01	0.97	0.95

Adopted FY26 base estimates

5.11 Based on the above methodology and inputs, the adopted base for toll plaza is shown in Table 5.2 below:

Table 5.2: Adopted base AADT for FY26

	FY25	FY26YTD	FY26A	FY26A vs FY25
CJV	14,974	16,632	16,487	10.1%

	FY25	FY26YTD	FY26A	FY26A vs FY25
LCV	1,954	2,226	2,242	14.7%
Bus	1,127	1,110	1,111	(1.4%)
2A	1,536	1,565	1,568	2.1%
3A/MAV	3,312	3,248	3,272	(1.2%)
OSV	3	2	-	
Total	**22,905**	**24,784**	**24,680**	**7.7%**
PCUs	**36,899**	**38,789**	**38,748**	**5.0%**

Source: Steer analysis: FY26YTD includes Apr-25 to Feb-26; FY26A is the adopted base traffic

5.12 From Table 5.2 above we see that FY26A is estimated to observe a 5.0% growth from the actual FY25 traffic on PCU terms. This growth is driven by a strong turnout of CJVs and LCVs on account of growing tourism and local activity near the Asset.

5.13 Several factors likely contributed to the lower-than-expected performance of 3A+MAVs on the Asset, including restricted construction material supply from Tamil Nadu following new regulations on illegal mining[31]; the development of new mining sites in Palakkad catering to Kerala's demand; and a decline in petroleum product shipments from Kerala to Tamil Nadu and other regions.

Estimation of background elasticities

5.14 Elasticities, in the case of traffic growth are the relationships between traffic and growth drivers. Multiplied with forecasts of growth drivers like GDP or GSDP, they provide the forecasts of background traffic growth rates.

5.15 As the TMS data did not provide a breakup between the individual vehicle categories for the toll categories 3A/MAV, we have used recent TVC 2023 split. Typically, we rely on national GDP as a growth driver for 3A/MAV trucks, given their characteristics of travelling across multiple states and carrying varied types of commodities which contribute to national GDP.

5.16 Table 5.3 below presents the growth drivers identified to model the background traffic growth rates.

Table 5.3: Identified growth drivers to model traffic growth

Vehicle type	GSDP Kerala	GSDP Tamil Nadu
Car	50%	50%
LCV	100%	
Bus	50%	50%
2A	100%	
3A	100%	

[31] ED in letter to TN DGP says sand mining happening in massive scale, demands action

[31] Keralites account for 69% of domestic tourist footfall in State - The Hindu

Vehicle type	GSDP Kerala	GSDP Tamil Nadu
MAV	100%	

Source: Steer analysis of Client data

5.17 To understand the traffic growth on the Asset, we undertook regression analysis from FY16-24 for all vehicles categories of the plazas.

5.18 This Asset has shown variable growth trends every year (for the reasons described in Chapter 3), due to which econometric regression analysis did not provide robust enough results of elasticities to growth drivers. We have therefore, analysed trends of each vehicle category and compared with the growth of key drivers, as described below.

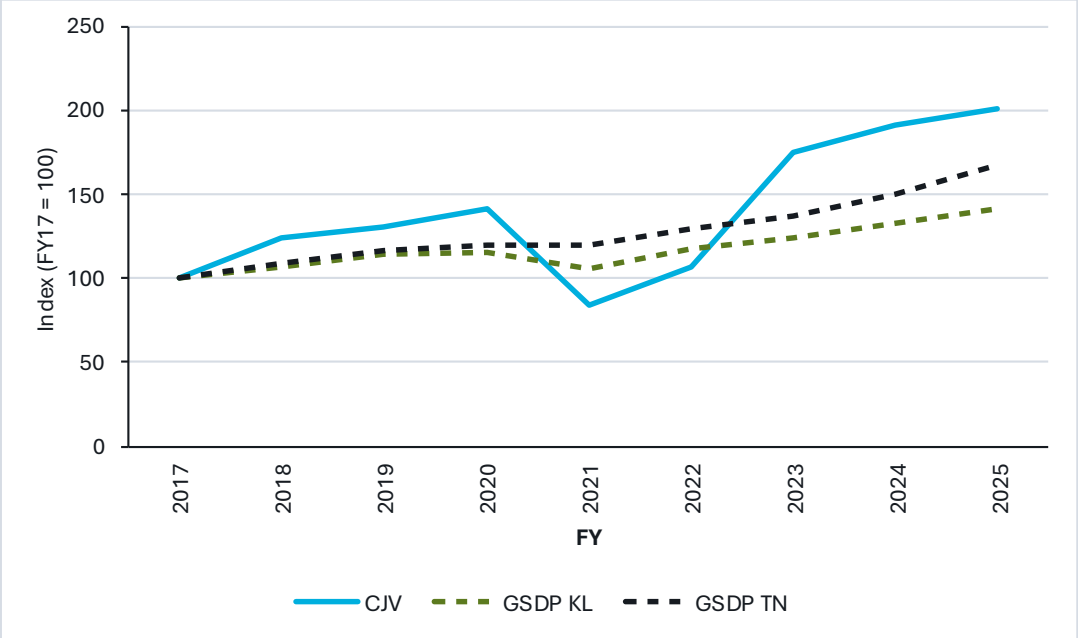
CJV

5.19 As can be seen from Figure 5-1 below, cars have shown strong growth on this Asset except in FY21 and FY22 with 9% car increase in FY24 from FY23 levels 10% increase in FY26YTD. As seen from the OD survey results from the analysis conducted in 2024, car traffic on the Asset is driven by local trips between the urban centres of Walayar, Coimbatore, Thrissur, and other areas in Palakkad district, as well as high contribution of tourism, work and educational trips.

5.20 Generally, we would expect that in fast-growing economies with relatively low car ownership levels, car traffic growth rates are often in line with or slightly higher than growth in GSDP/GDP (i.e., suggesting elasticities at or just above 1.0). Further, there is an expected increase in car ownership proportion of overall population as the economy grows. In this case with proximity from Tamil Nadu state and high share of Tamil Nadu trips, the Asset Car growth is dependent on both Kerela and Tamil Nadu.

5.21 Historically, the CJV traffic on the Asset had shown strong growth of ~14% in the FY16-FY20 period; the growth in this category slightly moderated in the recent years and saw a degrowth of 13% between FY20 and FY22. However, it has bounced back to achieve a 33% CAGR from FY22 to FY24, mainly driven by a significant post-pandemic ramp up in traffic in FY23.

Figure 5-1: Relationship between CJV traffic and GSDP of Kerala & Tamil Nadu



Source: Steer analysis of Client TMS data and publicly available GSDP data

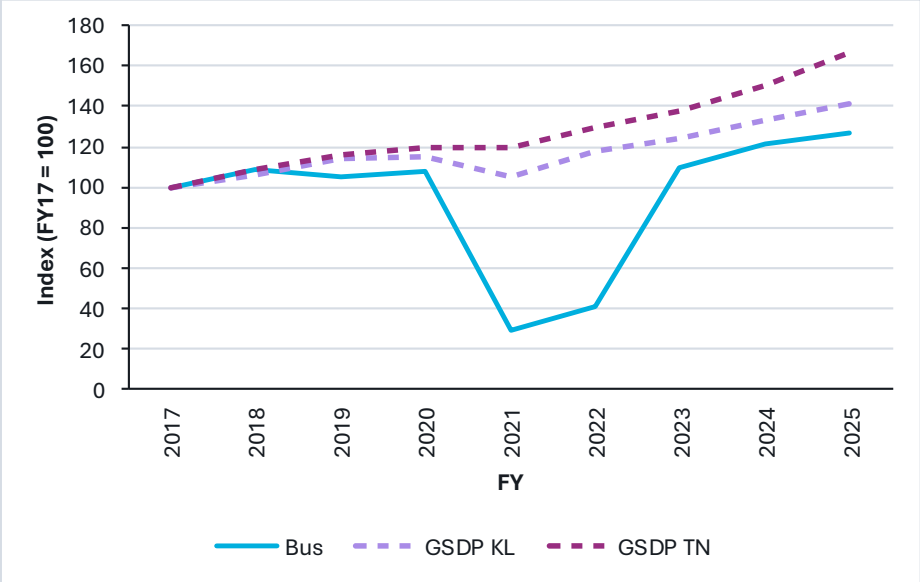
5.22 Nevertheless, the relationship to GSDP suggests that during more stable years post pandemic, CJVs have grown with a background traffic growth elasticity of 1.1. Considering the tourism-oriented nature of passenger traffic on the Asset, we have assumed a forecast background elasticity of 1.2 with the GSDPs of Kerala and Tamil Nadu.

Bus

5.23 Bus growth tends to be largely supply-driven in many parts of the country, with new buses being bought and deployed by the government at intervals of time. Based on our experience across the country, buses on inter-urban and tourism corridors show elasticities of 0.20 to 0.50 with respect to the GSDP.

5.24 The bus traffic trend on this Asset showed a modest growth rate of 3.8% from FY16-20. However, during Covid bus traffic was significantly impacted given prolonged lockdown in the state impacting tourism and leisure-bound bus traffic which recovered back to pre-covid levels in FY23. We expect the buses on this Asset to have an overall stable low growth in the forecast, with a relationship lower than benchmark states, to reflect this slower growth observed in recent years, and have used an elasticity of 0.4 to GSDP

Figure 5-2: Relationship between Bus traffic with GSDP of Kerala & Tamil Nadu



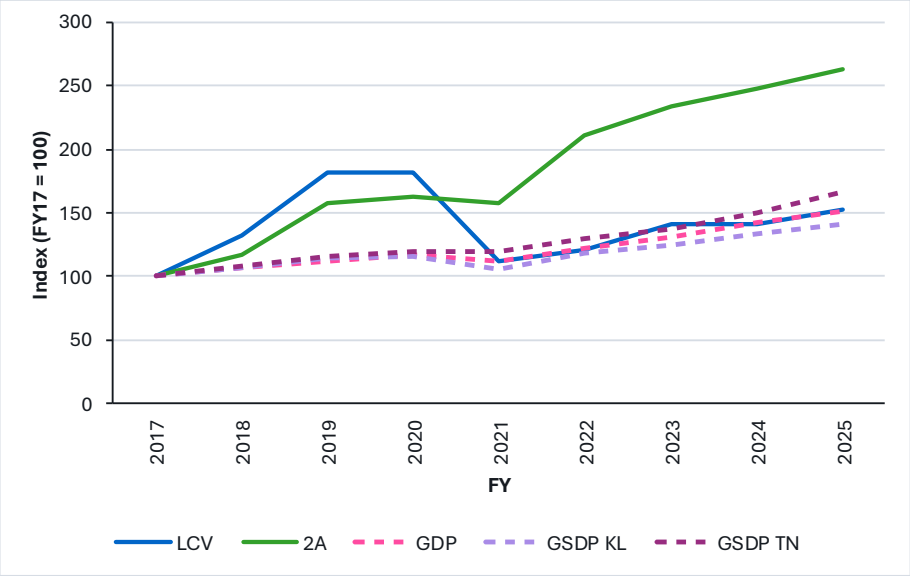
Source: Steer analysis of Client TMS data and publicly available GDP and GSDP data

LCV, 2A

5.25 Despite similar traffic characteristics regarding commodities and distance (as detailed above, in the Key findings of the origin-destination analysis), 2A and LCV vehicle segments showed divergent growth between FY18 and FY24. Notably, 2A trucks experienced a substantial 13.4% increase, while LCVs grew by a comparatively lower 1.1%. In addition to the typical influence of GDP and consumption demand-led growth, 2As have benefitted from the shifting preference of truckers from 3As - as a result of better unit economics – which has been observed on Assets across the country.

5.26 Therefore, looking forward, we have assumed lower elasticity of 0.40 for LCV and a higher elasticity of 0.80 for 2A with respect to GDP India, which is within the range of benchmarks observed in other parts of the country.

Figure 5-3: Relationship between LCV and 2A with GSDP of Kerala



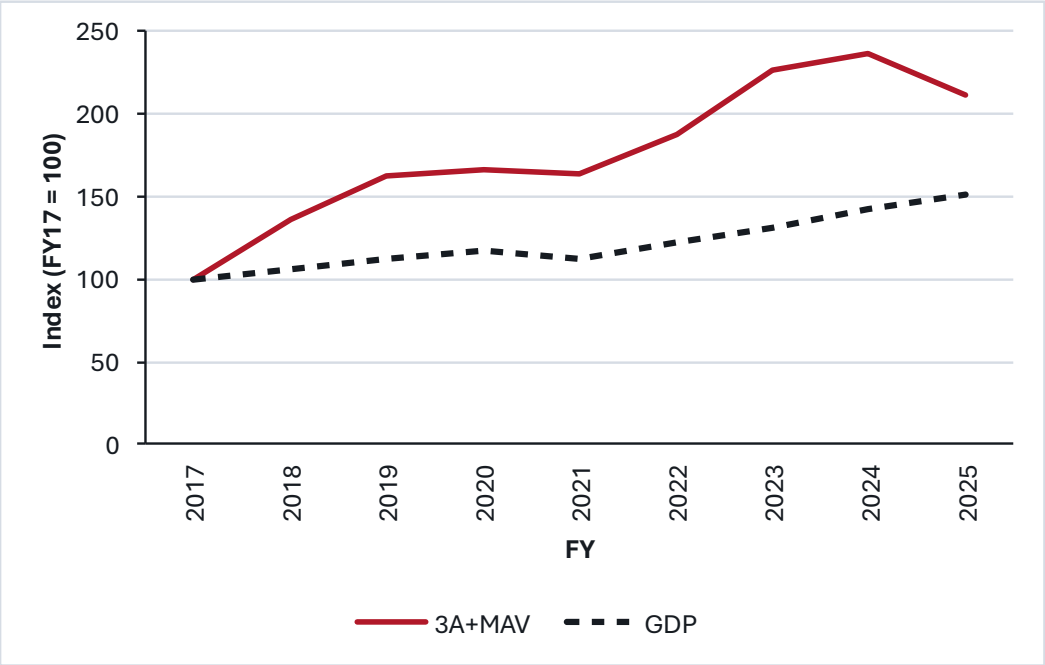
Source: Steer analysis of Client TMS data and publicly available GDP and GSDP data

3A/MAV Trucks

5.27 In general, across the country, we have observed that 3As grow slower than MAVs due to a shift between these categories, as there is an increasing preference observed for MAVs among truck operators (instead of 3As). This is because MAVs have higher load capacity which generate economies of scale and therefore lower transportation costs for high volume goods relative to 3A trucks. It is however unlikely that 3A trucks will disappear from the market completely due to this observed trend as certain commodities or movements are still (and will continue to remain) best served by 3As.

5.28 Based on these trends, we have assumed elasticities of 0.20 and 0.90 for 3A and MAV trucks respectively, with respect to GDP India, which are in line with benchmarks observed across the country.

Figure 5-4: Relationship between 3A + MAV and GDP India



Source: Steer analysis of Client TMS data and publicly available GSDP data

Forecasts for background elasticities

5.29 Table 5.4 below presents a summary of the results of the regression analysis carried out on historical toll plaza data and the macroeconomic drivers (GDP/GDSP), along with the assumed forecast elasticities for forecasting our background traffic growth.

5.30 3A category has largely remained flat in the FY22-26 YTD period. The reduction in 3A volume is partly a result of the declining demand for 3A vehicles itself, which are being replaced by 2A and MAV trucks. MAVs offer higher tonnage capacity making them more cost-effective for transporters. While the increase in 2A volume reflects the growing preference for these vehicles due to favourable changes in the legal permissible loads for 2As and their suitability for e-commerce-related freight, particularly high-value, low-volume goods over medium to long distances. This is consistent with our discussion with

various transporters and OEMs across the country who are favouring 2A and 5A vehicles for commodity movement due to better unit economics.

5.31 As a consequence of these evolving axle preferences, it has been assumed that the relationship between 3As and GDP will be relatively muted, whereas 2As and MAVs are expected to grow more closely in line with the country's GDP.

Table 5.4: Adopted forecast elasticities for background growth

Vehicle type	Growth driver	Historical Derived Elasticity	Period Considered	Forecast	
				Adopted Elasticity	Evolution of elasticity
Car	GSDP Kerala	0.74	FY17-24	1.20	Reduced to 1.1 from FY30 onwards
	GSDP Tamil Nadu		FY17-24		
LCV	GSDP Kerala	3.46	FY17-24	0.6	No change
Bus	GSDP Kerala	2.16	FY17-24	0.5	No change
	GSDP Tamil Nadu		FY17-24		
2A	GSDP Kerala	N/A*	FY17-24	0.8	No change
3A+MAV	GSDP Kerala	3.06	FY17-24	0.1 for 3A & 0.9 for MAV	No change

6 Forecasts: Network overlays and forecasts

Introduction

6.1 Following the discussion on our forecast of base growth rates in the previous chapter, this chapter first covers the forecasting assumptions around base year AADT and potential network impacts on traffic growth on the Asset. Thereafter, we present our assumptions around toll segmentations, trip factors and evolution of toll rates for the concession period which are used to forecast revenues as derived from forecast traffic. In the final section, this chapter summarises traffic growth rates for the forecast years.

Analysis of potential network/developmental impacts

6.2 The section below details the impacts which we believe would affect traffic on the Asset during the concession period. As discussed earlier in Chapter 2, to assess the impacts on the Asset, whether positive or negative, we have studied developments (alternate roads, feeder roads and regulatory) in the surrounding road network.

Construction Recovery

6.3 Throughout FY24 and FY25, the construction activities on the expansion of road network in the southern parts of Kerala have been negatively impacted due to unavailability of materials like aggregate and sand, since these regions source their construction material from Tamil Nadu. Changes in the quarrying landscape of the region in Tamil Nadu in Q2 and Q3 of FY24, which continued in FY25 and FY26, also affected the movement of construction materials on the project road. No further change in impact is envisaged at this stage. However, there is potential for a recovery in construction activity in Kerala, supported by key contributing factors such as inflows of remittances and commencement of major infrastructure projects including the Trivandrum Ring Road and the Vizhinjam Port expansion, are expected to provide a positive impact to overall construction and economic activity in the region.

6.4 We have therefore assumed a recovery profile in construction related traffic as presented in Table 6.1 below. This recovery in construction activity is expected to largely affect the 3A and MAV categories which have historically carried construction related goods:

Table 6.1: Impact of Recovery in Construction for TP1

Vehicle category	FY28	FY29 Onwards
Staging	*50%*	*100%*

Vehicle category	FY28	FY29 Onwards
3A	0.5%	0.9%
MAV	1.3%	2.5%

Source: Steer analysis

Construction Recovery

6.5 Construction of the Palakkad–Kozhikode Greenfield Expressway, designated as NH-966 (Greenfield), is being progressed by the National Highways Authority of India under the Bharatmala Pariyojana as a new access-controlled corridor to decongest the existing NH-966. The project involves developing a 121 km four- to six-lane highway linking NH-544 at Marutharode in Palakkad with NH-66 near Kozhikode, with construction preceded by detailed project report preparation and phased land acquisition.

6.6 It is understood that land acquisition for the project is underway. We have assumed a 2.5% positive impact for MAVs from H2 of FY30 up to H1 of FY34 (four years) on MAVs as construction traffic is likely to increase on the Asset as a result of the construction of the greenfield expressway.

Revenue forecasting assumptions

6.7 To forecast the revenues for a forecast year, the traffic forecast for each vehicle type is converted into tickets sold, which is then multiplied with the corresponding toll rate. While toll segmentation provides the breakup of trips paying each ticket type, trip factors provide the conversion factor to convert from traffic (trips) to tickets sold. This section discusses assumptions related to toll segmentation, trip factors and toll rates for the forecast period.

Toll evolution

6.8 Based on the concession agreement and the gazetted toll notification, we understand that base toll rates increase every year (revision month is April) based on WPI-linked inflation. These are rounded up to the nearest five to estimate the final toll rate charged to users.

6.9 We have used actual toll rates from the FY25 and FY26 toll notifications and FY27 WPI to validate the modelling of future toll evolution. Increase in WPI was calculated based on the Client's WPI forecasts, as shown Table 6.2 below. The upward trend in inflation is expected to continue in the medium term, before gradually tapering to 4.1% in the long term.

Table 6.2: WPI growth forecast assumptions

Financial year	WPI growth (%)
FY26	2.57%
FY27	0.96%
FY28	5.0%
FY29	5.1%
FY30	4.9%

Financial year	WPI growth (%)
FY31	4.4%
FY32 onwards	4.1%

Source: Client inputs used for WPI FY27 onwards

Toll segmentation

6.10 The Ministry of Road Transport & Highways has finalized a compensation formula for existing toll concessionaires to offset revenue loss from the Annual Pass scheme for non-commercial vehicles. To access the document, refer to the following **link**.

6.11 Across multiple assets, the share of annual pass trips has been rising on a monthly basis since August 5. A corresponding decline in other ticket categories including Single and Return journeys has been observed.

6.12 CJV Segmentation for FY26 has been developed using the pre annual pass segmentation till 14th August 2025, and post-annual pass segmentation from 15th August 2025 till 28th February 2026. The share of annual pass trips in March 2026 has been assumed to be the same as the share of annual pass trips in the last 10 days of February 2026.

6.13 The segmentation for CJVs in FY27 has been assumed to be the same as the estimated March 2026 segmentation as trends suggest that the share of annual pass trips have stabilised. For other vehicle categories we have analysed the historical TMS data split by ticket categories, to understand trends, as shown in Chapter 3. For the traffic and revenue forecast, FY26YTD (Apr- Feb) as discussed in the earlier sections, can be considered a normal period.

6.14 Table below shows the toll segmentation assumed for the period of forecast.

Table 6.3: Forecast toll segmentation from FY26 onwards

Ticket type	CJV (FY26)	CJV (from FY27)	Mini LCV	Bus	LCV	2A	3A/MAV	OSV
Single	32.9%	28.4%	37.9%	45.1%	35.6%	55.8%	59.8%	52.9%
Return	50.1%	51.1%	58.8%	28.3%	55.3%	44.0%	40.1%	46.9%
Monthly	1.3%	1.4%	1.6%	25.8%	8.9%	-	-	-
Annual Pass	14.2%	17.5%	-	-	-	-	-	-
Local personal	-	-	-	0.3%	-	-	-	-
Violations	0.1%	0.1%	0.1%	0.0%	0.0%	0.0%	0.0%	-
Exemptions	1.5%	1.6%	1.7%	0.5%	0.2%	0.2%	0.1%	0.2%

Source: Steer analysis of Client TMS data; ticket segmentation for all vehicle categories other than CJVs are from FY26 onwards

6.15 The Annual pass compensation is separately calculated using the formula prescribed by NHAI in the same circular. Following Table 6.6 presents the Annual pass compensation computed for the toll plaza.

Table 6.4: Annual pass compensation for CJVs (in Crore)

Toll Plaza	FY26	FY27	FY30	FY35	FY38
Pampampallam	4.6	6.5	8.9	15.5	21.8

Source: Steer Analysis

Trip factors

6.16 Trip factors are used to calculate the revenue for the trips made on passes such as return, local personal, monthly passes. The trip factors assumed are based on the latest FY25 data available and listed in Table 6.5 below:

Table 6.5: Trip factors for the forecast years

Ticket Category	CJV/Mini LCV	LCV	Bus	2A	3A/MAV	OSV
Single	1	1	1	1	1	1
Return	2	2	2	2	2	2
Monthly	4,357	567	53	227	34	45
